Milking Market-Milk Producers.

How One Branch of the Dairy Industry of California Is Trying to Beat the Monopolization Game by Co-operation.

[Written for Pacific Rural Press.]

IN NO branch of the dairy industry have conditions changed more radically, in recent years, than in the production and sale of market milk and cream. This is largely attributable to the increased population of our cities and better transportation facilities from distant points to these centers.

It was not so many years ago that the dairyman supplying milk to the city trade acted in the capacity of producer, wholesaler and distributor, but not so today. For instance, figures given out July 1, 1915, show that 80 per cent of the 37,216 gallons of milk and 1,380 gallons of cream sold daily in Los Angeles is delivered by 23 city plants, while approximately two-thirds of the 30,216 gallons of milk and 5,940 gallons of cream consumed in San Francisco is distributed by eight plants, there being 40 such concerns in San Francisco altogether. While perhaps not to such a marked degree, the same condition may be found in other cities of smaller size in the State.

City and State Laws Are Making Sanitary Barns Compulsory, Particularly on Market Milk Dairies.

While the distributing of milk has been largely concentrated into the hands of a few, the producing field has been greatly enlarged. Practically all of the sweet cream and some of the whole milk for the Los Angeles trade is secured in the southern part of the San Joaquin Valley, a rail distance of over 250 miles in many instances, and the field supplying San Francisco and adjoining cities now reaches over into both the San Joaquin and Sacramento Valleys, instead of being confined to the Bay counties, as before.

Another changed condition is the cost of production. This is particularly true in districts adjacent to the city markets, where increased population has greatly enhanced land values. This has caused an increase in rentals, and has been added to by increased cost of stock feeds, almost a 100 per cent gain in cow values in the past five years, a material increase in milkers' wages, and last, but not by any means least, an increased cost of production following the passage of new State and city laws.

With the above factors have come an expansion of the market and an increased retail price of milk; also a lessening of cost of city distribution by routing of the cities, making it possible for one vehicle to accomplish as much in a day as was previously done by five.

Theoretically, we might suppose that the new order of things was better than the old one for all concerned; the retail price has been raised at least 20 per cent and sometimes more in the last five years, and more efficient methods of distribution have been inaugurated, the systematizing of the business has closed up the leaks, and the growing populations have made it possible for a larger number of producers to dispose of their product at better prices than the creamery can pay.

How the Joker Jokes.—But when we analyze the situation carefully, we find a financial joker in the woodpile, which is not only working to the present disadvantage of the producer, but may limit future production, thus being a menace to producer and consumer alike. Like most woodpile cavities, having to do with foodstuff production and consumption, this one is shielding a burly middleman, before referred to as a "distributor."

To be brief with this gentleman, the situation is about this: he has, through co-operation with his capitalistic brother distributor, stopped up most of the leaks in the delivery of milk and cream by gradually eliminating competition, and this very process of "the survival of the fittest" has given him a position carrying strong dictatorial qualifications. The above figures for both San Francisco and Los Angeles show that he has done a pretty good a pretty good job at monopolization in the distributing end of the whole milk industry. If this monopolization did not affect the production or consumption of milk, producers would have no just complaint; in fact, they would doubtless thank him for lifting a disagreeable load from their shoulders, but no sooner did he get control of the market than he began to dictate to producer and consumer alike regarding the price of milk.

While getting the retail price to its present level, the producer was treated fairly well, but in the past three years the San Francisco firms have been gradually tightening up the string on the producer like this: In 1913 the contract price for milk in this market was 18 cents per gallon, f. o. b. San Francisco; in 1914 it was cut to a 17½ cent basis; and in 1915 large quantities were purchased at as low a rate as 12 cents per gallon, and the average price was approximately 16 cents. Though paid on a different basis, the producer

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., December 28, 1915.

STATIONS	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	.36	11.99	16.12	58	34
Red Bluff	0	9.40	9.64	68	40
Sacramento	.02	5.18	6.81	60	36
San Francisco	.05	7.36	7.89	66	44
San Jose	.06	4.62	5.93	66	38
Fresno	.01	3.01	3.34	62	32
Independence	0	0.33	3.30	—	—
San Luis Obispo	0	3.86	5.47	80	36
Los Angeles	0	3.18	4.88	82	44
San Diego	0	2.20	2.96	76	44

THE WEEK

The weather continues glorious for work, for recreation and for the simple act of living. The rains are ahead of the normal in average places, the frosts are not fierce, ripe oranges have gone from early districts with unwonted zip, and the outlook is for a very broad and active winter trade in citrus fruits. Orchard planting is awakened by the recent advances in cured fruits and by the outlook for better prices still, for both fresh and cured fruits, through organization, and the increased purchasing power in consuming districts. Intending planters should secure their trees at once, for it looks as though there would be a very strong drive made on available supplies in the nurseries.

Taking all things together, it looks as though we were well started on an "old-fashioned California winter," a winter of warmth and wetness so interspersed that both plant and man could do their best in growth and the promotion of it by work. Just what an "old-fashioned California winter" is this writer does not know, for forty years ago the words were used to denote a thing to be devoutly desired, just as the words are used today. It is probably a localization of the old poet's epigram: "Man never is, but always to be, blessed." And yet, 1915 must be remembered as about as close an approximation to such blessedness as man is likely to realize. Fortunately, the Weather Bureau has measured it, in terms of the exposition, and we desire to place it upon record for future readers to measure by: The total number of rainless days during the fair was 244 out of 288, or eighty-five per cent. In June, July and August, when fog generally occurs in San Francisco, there were 81 clear days, 33 partly foggy and 9 foggy. In the dry season, May 17 to November 8, six months less nine days, the total rainfall was .07 inch, the entire period of rain about one hour. In the so-called rainy season February 20 to May 17, and November 8 to December 5, during the fair hours, 8 a. m. to 12 p. m., the record shows that rain fell on 28 days, and there were 84 rainless days.

But sunshine is only one of two great human measures of beatitude; the other is multitude. This is probably the sublimation of the great "social instinct" of mankind which ethnologists discourse upon. Fortunately we have also a measure of that to place upon record for future use: "I have never experienced anything like those days in California," said Thomas A. Edison to a recent visitor at the East. "I can't realize that there are people in the world like the people of San Francisco. I never saw so many people together and I never experienced so much human interest and such an appreciation." And, after discussing other subjects, he would come back repeatedly to the exclamation: "But those people in San Francisco—and so many of them!"

Sunshine and multitude—they are the record and the prophecy for California!

The Unhappy Shoemaker.

Well, we have had some holiday sunshine, because for two weeks we have been sitting so high on the bank that our critics could not drive over us. That is one of the editor's great prerogatives: he can shunt objectors into the wastebasket, and, so far as his constituency goes, he can bathe himself uninterruptedly in the sunshine of appreciation, and, perhaps, he is a foolish editor who does not make himself great by so doing. But our conscience reminds us that we agreed to give right of way over our prostrate form to all vehicles of criticism — providing, of course, that the drivers ante up a dollar a year to the publisher, for we are no highway for road-agents or hoboes. And here comes one, having met the conditions, and must have his say:

In your editorial note, "Modern Shoemakers Not Cobblers," in the issue of December 11, you talk through your hat. You should get the facts before you talk of some other man's business. The nice machinery which you say the modern shoe-maker has—over one-half of it belongs to the United Shoe Machinery trust of Boston. We lease it from the trust, paying in the neighborhood of $700 for the use of a stitcher, sand-paper machine and finishing machine; a royalty of $5 each month for use of stitcher; then, besides, there is a nice little meter, which registers every stitch made by the machine, for which you pay so much per 1000 stitches, after paying $700 and $5 royalty monthly. If you wish to move the machinery you must notify the trust, which has your $700. The meat trust gets at the shoemakers in the way of sole leather, which sold for $2 per dozen squares or blocks five years ago, and sells for $2.85 now. Linen thread, which sold for $1.10 per lb., sells for $1.55 a pound now. Buttons, button-fasteners, nails and everything the shoemaker uses has gone up, some 50 per cent and others more. The old cobbler got $1.25 and $1.50 for half-soles; now we get $1, and have to argue to convince the people that they are not being robbed.

It would, of course, be unkind to dispute with you after inviting you to speak your mind freely, but, if we could bring ourselves to it, we should say that you have made about as good an argument in favor of the trusts as there is to be made. You have shown how the many different inventors who have contributed modern devices to shoe-making and repairing get their pay; how the machine-makers and leather-makers get their profits, and how the public saves from one-fifth to one-third the money it formerly paid for new soles. And that, if we mistake not, is all that the trusts ever claimed to establish their righteousness. You have taught us more than we ever dreamed of knowing about machine shoe-repairing, for we never did anything but see the wheels go round and pay the money. But you have omitted the only thing which is of any importance in the discussion, viz.: you do not say whether you can now get more or less for an hour's or a day's work, with these efficient helps, than you could with hand-awl, thread and wax. We do not know anything about that, but your kind of artists seems to us more prosperous and to be occupying a higher social position than formerly—and that is all we said in writing about it previously. If you are really being squeezed between cruel trusts and a miserly public, why did you not yell about that?

A City View of Farmers.

Our critics are very prolific of suggestions as to how we should handle our constituents, so that they can be made better from the farm-loan point of view, and therefore receive fairer consideration from financiers making such loans. One such reader toots at us, as he goes over, these words:

You can render the greatest service to your farmer readers by inducing them to increase their own efficiency. For instance, the farmer is a notoriously slow-paying borrower. He hardly ever pays his interest or principal on time, and thinks that because he has security he can let the matter run as long as he likes. Again, the average farmer is careless with his tools and implements, leaving them in the rain and sun, scarcely ever giving them a coat of paint, and allowing them to deteriorate on his hands much more rapidly than does ordinary machinery used in commercial business. Again, in the matter of soil depletion: how many farmers are intelligently conserving the fertility of their soil? How many farmers can even name to you the four principal elements of plant food contained in the soil, let alone naming the other six of the leading ten, and if a farmer does not know what chemicals his soil contains, how can he know how to maintain the fertility of that soil? The soil is the farmer's source of supply, from which he must pay his principal and interest, and if he wastes this source he will never be able to pay his debt.

There is, of course, certain truth in this claim, but it contains much which is wrong in its inferences. The farmer dealing with natural agencies and forces needs more science than is required in many other occupations, and he knows it and is getting it very fast; but there is practical learning which comes from correct observation and correct deductions from experience quite apart from the teachings of the schools in the particular line which our critic so strongly emphasizes. For example, the men who established the types of the best breeds of animals we now have, knew nothing of science, and yet Darwin drew very much of his science from their achievements. As between the two we would prefer to lend money to a farmer who really knew an ox than oxygen, or a plant than phosphoric acid, etc. And, of course, if a man fully knows an ox or a plant in operation he is really a more scientific farmer than a man who only has a skull-full of symbols and formulas. Our critic is away off in his requirement of chemistry as indispensable, desirable as it is. It is a serious error to set up any particular scientific dictum as a measure of farming success, because you

can find so many instances against your standard. This is because successful farming is a great deal more than the "science of farming," popularly so-called. It was of successful farming that the Dutchman once said: "Te more vot a man knows te more he finds, by grashus out." And no one knows that better than the farmers of the present day, and no class of our population is doing more to understand its business, and to do it better, than the farmer. As a class, farmers do not need to be exhorted along the lines our critic cites; they are already onto such things and as a class are going faster and farther than men in other occupations. Take for instance, the statement of Miss Brownson, county librarian of Butte county; it makes argument unnecessary. Miss Brownson is credited with these words concerning the kinds of books she has to supply to different classes of readers: "Farmers are more interested in technical discussions of farm problems than business men are interested in discussion of efficiency management and methods. The demand from branch libraries in cities and towns is almost exclusively for fiction, while the rural communities want weightier reading. The demand among business men for books and articles of a technical character dealing with their business is practically nothing, while there is a big demand for such information from farmers."

But we will admit that the farmers as a class do not fully understand the point which our critic makes of the desirability of prompt payment of financial obligations, but he is not altogether to blame for that. Much of his slowness is due to the nature of his business, to his own postponed receipts, to the fact that he is master of no sales as the merchant is, and that he is too often powerless to realize upon the value he has created.

Banks with an Agricultural Point of View.

This slow-payment of obligations on the part of farmers is in large part beyond correction, and must be provided for in the point of view in the institutions financing his operations. This has long been successfully done in other countries; in fact, the United States is, perhaps, the only country which is attempting to finance farmers directly through commercial banks; elsewhere, though commercial banks lend largely for agricultural use of capital, they do it not directly, but through other banks which are separately organized for it. It is too soon to declare that such policy must prevail in this country, but public opinion seems to be strongly tending that way. It is now announced from Washington that the joint-committee on rural credit of Senate and House will report next week a bill providing for a "land bank board" of five members to supervise and control the operation of regional banks. The country would be divided into twelve districts, each with a regional land bank having a capital stock of $500,000, to be issued in $10 shares for purchase by the public. Any such stock not taken within 90 days will be subscribed by the Federal Government. Business would be done directly between the regional banks and the local bodies which farmers would be authorized to organize in the form of co-operative stock banks, charters for which would be passed on by the land bank board. Applications for loans approved by the local organizations would be recommended to the regional bank of the district. The banks would be authorized to loan out capital stock or to sell bonds to obtain sufficient funds to make the loans and the farmers would be charged as interest, the interest on the bonds plus one per cent. To reduce the rate of interest on the bonds the bill will provide they must be acceptable by the banks as security for the deposit of public funds. This is, of course, a bare outline of the system, but it will suffice to indicate that the present Congress will have opportunity to do something with rural credit, and what it will do must be awaited.

Queries and Replies.

Querists must give name and address.

Starting for a Good Prune Tree.

To the Editor: As I am new at the business I wish your advice on how the French prune should be pruned. I planted them last April and they made a big growth. Some of the limbs are six and eight feet long. I want to start them out right, for I have ten acres of them.—Subscriber, Los Molinos.

Select three or four branches which start out at different places on the stem, if possible, and point in directions to make a well-balanced tree. Cut these back so as to leave them a foot to a foot and a half long, and remove all others at their starting points. This will start your tree, strong and low-branching, without too many main branches to be sawed out later. With such an important enterprise on hand you should read carefully our book, "California Fruits," which gives reasons and details of such operations.

The Peach-Almond Root.

To the Editor: What is your opinion of the value of peach-almond root as a stock for the prune or apricot?—Subscriber, Hollister.

The peach-almond was first proposed as a stock (and probably used to some extent) at least forty years ago. It was first probably a chance hybrid and was later intentionally produced again by Mr. Burbank in his crossing work and introduced formally by him, if we remember correctly. In spite of its long life in public knowledge we are not aware that superiority to seedlings of either almond and peach has ever been demonstrated by comparative test, nor do we know of large propagators who have substituted it for uncrossed seedlings of these fruits. If any reader has reached clear comparative judgment on the matter we would like to know it.

Almond Shotholes.

To the Editor: I sprayed in November using lime and sulphur and will spray again before the buds open. But I have been told that there are two kinds of shothole affecting almonds. I do not know the difference and should they be treated differently? Is rust destructive to almonds and how detected?—S. T. R., San Benito.

There are two fungi which shothole the almond. One is the same which causes "peach blight" and is apt to work on the bark of the twigs in the winter: the other is commonly called "almond shothole" and does its chief work on the leaves in the summer. You will be doing all you can for both of them by your fall and spring use of lime-sulphur. If you have a leaf attack late in the summer a weak Bordeaux or more dilute lime sulphur can be used, but the chances are that you will not need to give summer treatment. We do not know what "rust" is unless it is the roughing by the red spider and that you can check by sulphuring as soon as you notice it beginning to appear.

Does Hungarian Need Pollenizing?

To the Editor: I have Hungarian trees about 14 years old, and they have never borne to amount to anything—fine, healthy looking trees, too, blooming heavily every year. The plums form and when partly grown drop off. Is there a way through grafting or budding, to make them bear? They have always been thoroughly cultivated, and irrigated since they were three years old. Can I graft part of the trees to some variety that will make the balance bear? If so, what variety of plum is the best for that?—Old Subscriber, Penryn.

The old Hungarian has a reputation for being variable in bearing under different conditions, but our observation covers no such case as yours. Our experience has been in overbearing and considerable breaking of the brittle branches. We have to refer your question to our plum-growing readers.

Vine-Stumps and Vine-Hoppers.

To the Editor: I have a 12-year-old Malaga vineyard. I have pruned it, but find an accumulation of many years' old bark on the vines. This is a great place for harboring insects. I would like to take all this off if it would not be harmful to the vines; also what spray or wash to use on the trunks. Vine-hoppers were bad last year. I have removed all prunings and the ground is clean with a clover cover crop sown.—R. H. P., Coachella.

It will do no harm to remove the old bark which is largely loose and will scale off easily. A good spraying with winter Bordeaux will be best to use on the cleaned stumps. The vine-hoppers will probably be very busy on your cover crop until the vine leaves appear. If you find them on the clover, it should be thoroughly plowed under and covered well a month before the vines start.

Prunes on Almond Seedlings.

To the Editor: I have some young nursery trees; they are bitter almond root. I budded them in September and some of them did not stick. I am thinking of working over the ones that did not stick into imperial prunes, and I would like to know just how you would do it. Would you graft them in the nursery row and then plant out this spring, or would you plant out now and then graft? What kind of a graft would you use, and how much above the ground would you graft?—F. E. P., Guinda.

We should graft in the nursery row, not after planting in orchard. We should whip-graft the smaller and cleft-graft the larger seedlings—in both cases working as near the ground as possible. The seedlings should be transplanted or cut under to cause new root growth near the stem.

Peas for Spring Silage.

To the Editor: Can you give me information as to the advisability of planting Canada field peas along with barley with a view to making a silage crop for next spring?—O. L. L., Modesto.

We should plant in your light loam as soon as we could get the ground ready—it would be better to have planted a month ago. Both these plants are hardy against valley frosts and should be ready to take advantage of all the rains.

BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

Also Book Containing Valuable Garden and Field Information.

One of the largest seed houses in the West, the Aggeler & Musser Seed Co., of Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1916 catalogue from the printer, and are beginning the distribution of the same. This is their 23rd annual catalogue and it surpasses all previous editions. It is said to be one of the most complete seed books published and contains answers to more than 1000 questions. It gives information regarding every kind and variety of plant grown in the Southwest, and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use in order to obtain the best results. Valuable hints on poultry, spraying and use of insecticides are also given.

In addition the distributors have issued a hand booklet entitled "The Garden Manual." It gives good, practical answers to questions which gardeners and ranchers have asked from time to time.

The Aggeler & Musser Seed Co. will gladly send their catalogue free and postpaid to anyone writing and requesting it.

WALNUTS FOR PROFIT

Young Franquette, showing vigorous and shapely growth.

We are growers of the Walnut from the utility standpoint. In our orchard at Morgan Hill, Santa Clara county, we have thoroughly demonstrated its utility and profitableness.

WE ARE OFFERING THIS SEASON extra fine stock from scions cut from our own bearing trees.

IF INTERESTED we invite you to inspect both our bearing trees and nursery stock, or write us for further particulars.

RUEHL-WHEELER NURSERY

1635 MARKET STREET, SAN JOSE.

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a through test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevadas, assuring a fibrous root system second to none in California.

Write for catalogue and full list of trees.

Root-Knot from the Pit.

[Written for Pacific Rural Press by C. F. Collins, Horticultural Commissioner, Tulare County.]

In the Rural Press of Dec. 18th an Esparto reader asks if a tree will inherit root-knot, or crown gall, from a pit taken from an infected tree.

Perhaps the following extract from a paper written by me and read at the State Fruit Growers' Convention in San Jose in Dec., 1913, relating my experience in that line some three or four years previous will be of interest:

"Probably few orchards in this State are free from the bacterial disease known as crown gall, or root-knot, for which no control is yet known. It is often the cause of considerable loss in the nurseries, and, no doubt, renders thousands of trees unprofitable in the orchards of California. Much of this trouble may be eliminated by selecting seed for nursery stock from vigorous trees known to be free from crown gall, as seed from diseased trees will produce crown gall stock. As an example, I will relate a little personal experience: For several years I grew a small quantity of peach stock each season, using seed from a nearby vigorous Salway orchard and obtained fully 90 per cent of clean stock. One season I could not get the required amount from this orchard so purchased some from another Salway orchard in the neighborhood, keeping the seed separate and planting side by side in the nursery. The last lot of seed produced 90 per cent of crown gall stock. The first lot 90 per cent of clean stock. Part of the affected lot was budded to Elbertas, and, as I needed a few of this variety to square up an orchard, I selected from this lot 121 of as clean, vigorous and healthy looking June buds from sixteen to twenty inches high as any one could wish for and planted. That season all but a dozen of them made an excellent growth. The following spring two or three did not start and several more looked feeble. I impressed the "long-back" shovel into service, beginning with the dead ones and continued up one row and down another until the whole 121 trees were uprooted and 120 of them showed plain evidence of crown gall. Three years later the orchard from which I obtained the infected pits was uprooted at the age of fourteen years and nearly every tree was affected."

[Although this does not amount to an absolute demonstration, the lesson clearly is to get pits from trees free from root knot.—Editors.]

SAVE TWO YEARS IN RAISING OLIVE SEEDLINGS.

Nearly two years may be saved in the growing of olive seedlings by the use of improved methods, announces the University of California. The most important of these methods is the clipping off of a piece of the pointed end of the woody pit by means of a special "clipper" devised by the Division of Viticulture. With this clipper 1500 seeds can be clipped per hour.

The clipped seeds germinate within a few weeks. If the seedlings are given proper care they will be ready to graft by the time untreated seeds have commenced to germinate. The growth of the seedlings from clipped seed is as vigorous, if not more so, than that of seedlings from seed which has been stratified in sand for sixteen months in the ordinary way.

It is generally recognized that grafted seedlings make the best trees. They have been little used, owing to the time wasted and the difficulties encountered in the old methods. By the improved methods, grafted seedlings are more easily raised than cuttings and a bearing tree produced almost if not quite as quickly.

STUB-PRUNED TREE BREAKS.

[Written for Pacific Rural Press.]

For some reason, one branch of a triple-forked prune tree in C. H. Pachett's orchard in Sonoma county died and was cut off, square with its own axis. Another vigorous shoot started from the stub several inches below the cut; and after a few years became a vigorous fruit bearing branch. As it grew, it extended a growth of healthy green healing tissue farther and farther around the old stub, which did not seem to be rotting. Last summer, before the healing tissue had surrounded the stub to its top, the new branch had a heavy crop and the tree is again mutilated. Weight of fruit and perhaps a wind tore loose the ¾ inch growth of new wood from around the stub. Mr. Pachett is not alone in loss due to the same cause—leaving stubs in pruning.

PRUNES OUT LEMON SUCKERS IN FEBRUARY.

[Written for Pacific Rural Press.]

The best time to prune Eureka lemons in the San Fernando district is when the pruning shears are sharp, and this is all the time, according to H. E. Wilkinson. But if other work presses, it is best early in the spring—February if possible. This lemon grower pruned a year ago last winter and spring and got the biggest crop ever from his 27-year-old trees. Last March he was expecting at least ten boxes per tree for the year ending in September. Mr. Wilkinson prefers to keep his Eurekas open, taking out all suckers, and building the tree from fruit wood. He doesn't stub the suckers, as many do, to fill out the tree; but always gets rid of them with a clean, close cut. "When you begin to stub the suckers, you will have to keep your pruning shears busy all the time—you have gotten into a peck of trouble. So many suckers will be sent out that it will be a suckerous tree."

POMELOS RIPEN ON TREE.

Pomelos should be left on the trees until February to June according to E. O. Giddings of Tulare county. That makes them jucier, sweeter, nicer flavored, and less bitter than if picked about Christmas. He treats his trees about like orange trees, of which he has several varieties. He notes that pomelos will stand less frost than oranges.

When you buy fertilizers, buy the kind that has the most plant food value.

Gold Bear fertilizers have plant food value, because they are made from products recognized by agriculturalists, to contain the necessary elements that feed the crop. There is a book of fertilizers we would like to send you. Write for it.

Inspect and Treat Roots.

[Written for Pacific Rural Press.]

A bug on the root of your nursery tree may spell failure of the tree and the orchard after you have spent a lot of money bringing it to bearing age. More unthrifty trees are suffering this way than are dreamt of in most philosophies.

The bug may be a microbe, the kind that causes crown gall. We saw a magnificent orchard last spring with great gaps, where big trees had just been taken out dead with crown gall. You don't want to plant a tree with that on it. Reliable nurseries have every tree inspected before shipment, but sometimes men who do the work are ignorant or careless. Horticultural commissioners cannot be omnipresent. And it is pretty hard to distinguish crown gall from the callous that may grow naturally at the graft union. Both are usually located at the crown of the tree.

Root knot has a similar appearance, but is due to miniature worms which irritate the roots, usually at a considerable distance from the crown, and cause them to enlarge into ugly knots. These may be cut off and the tree used with reasonable safety.

Dip Roots for Aphis.—On pear and apple roots, the bug may be the woolly aphis. It will be one of the hardest of orchard troubles to combat after planting, but may be easily killed by washing dirt off and dipping the roots in a mixture of blackleaf 40, 1 pint per 200 gallons of water. A gallon of liquid cresol soap mixed into the dip may help. It is a good insurance to dip all roots of these trees except perhaps when apples are on Northern Spy roots.

On all peach roots, the black peach aphis may be waiting for a chance to infect new orchard plantings of almonds, plums, prunes, etc. This is controlled as above.

CITRUS FRUIT GROWERS' CONVENTION FEBRUARY 18 AND 19 AT SAN BERNARDINO.

The next State Fruit Growers' Convention will be held at San Bernardino in connection with the National Orange Show according to announcement by State Horticultural Commissioner A. J. Cook. The orange discussion will be led by C. C. Chapman, who will speak especially of the possible value of a "brand." The discussion of the lemon will be in charge of C. C. Teague. A. D. Shamel will speak of the pomelo Marketing will be discussed by our new Commissioner of Marketing, Harris Weinstock. G. Harold Powell will speak on the problems of the citrus industry. The citrus outlook of Butte, Sacramento, and Tulare counties will be presented by Fred Mason, W. W. Hinsey, and H. Webster, respectively. Soils and soil fertility will be discussed by the Messrs. H. J. Webber, I. G. McBeth and W. P. Kelley from the Riverside Experiment Station. The 8 to 1 orange test will be explained. Professor H. J. Quayle will give the latest on fighting scale insects. E. O. Essig and H. C. Bryant will give lantern talks on insects and birds, respectively. Col. Weinstock will repeat the address which he gave at Visalia, which elicited great praise.

A one-day apple meeting will be conducted by Chief Deputy Commissioner G. P. Weldon on Saturday, February 19.

CLEARS PRUNINGS QUICKLY.

[Written for Pacific Rural Press.]

It didn't take two men very long to clear out the prunings from C. E. Jackson's prune orchard in Santa Clara valley this fall. The prunings were thrown from two rows into one windrow handy for a horse rake. Ten acres were cleared in two hours one afternoon, dumping the prunings outside the orchard where they could be burned without damage to trees.

The rake is made by bolting nine pointed 2x3 sticks underneath and crosswise of a 6x6 timber 11 feet long. These "teeth" project 3½ feet in front of the timber and about 8 inches behind. They are braced into place by laying a 1x6 flatwise across them just along and in front of the 3x6. A strap iron reaches from each tooth across this to the 3x6 and is bolted to hold the teeth rigidly.

Two plow handles are braced by strap irons and rods running to the front side of the 3x6, to the back ends of teeth, and toward the ends of the 3x6.

The rake is pulled by a horse hitched by a 10 foot chain to each end of the 3x6. It slides along the ground gathering all the brush until loaded, when it swings over into a row already cleared and proceeds to the edge of the orchard. There it is dumped by simply lifting a little on the handles as the horses proceed.

In parts of the orchard, the brush from 6 trees' distance made a load; in other parts, as much as 28 trees' distance.

ASPHALT FOR PEACH BORERS.

[Written for Pacific Rural Press by W. D. Guthrie.]

In applying asphaltum to prevent peach borers on stone-fruit trees, Prof. Howard Dickson of the Kerman High School found by several experiments that February, while weather is cool, is the most effective time. Later than that, the weather proved too warm to harden the asphaltum. The result was that the oil soaked into the trees and killed many of them.

[Santa Clara County Horticultural Commissioner Earl Morris recommends grades C or D of hard asphaltum to be applied boiling hot with a brush to the crown of the tree from above the surface to six inches below. This is simply a protection. Borers already in the tree should be dug out with a flexible wire.

Hardened asphaltum well applied would stop their depredations next spring anyway, by preventing emergence of the moths which lay their eggs outside. But digging the worms spring and fall saves a lot of damage.]

A little bug may become a million.

Wind-Proof Wax Pot.

"Sometime ago we noticed you were wanting information in regard to a wind-proof wax pot for grafting, and as I solved this problem two or three years ago, I submit the following," writes Ogden Bolton, Jr., of Santa Rosa.

"The furnace is a charcoal burning pot with dampers similar to a stove both in front and on top of the short chimney. The heat is thus regulated to perfection; and the more wind there is the better it burns, though it burns all right if there is no wind.

"I use broken corn cobs with kerosene to start the fire, and then apply charcoal in pieces the size of walnuts or smaller. The furnace is eight inches in diameter and twelve inches high, not counting legs or handle; and may be made out of an old blasting powder can. The pot is set into a hole in the cover and holds about two pounds of wax. I use wire across the wax pot to hang the brush up in the wax so that it won't touch the bottom of the pot. About three inches above the bottom of the furnace is a box three or four inches square to hold the charcoal when burning. The charcoal is inserted through the door in front. The bottom of the box is grated so that the draft from the smaller door, 1¾ inches in diameter, just under the charcoal-burning box, will go through the coals. The grate is made of twenty penny nails riveted into flat end pieces just large enough to fit into the box which is one inch high in front, and two inches high behind to keep the charcoal from falling out. It is held up behind by a plate with legs on it which reach to the bottom of the furnace. The charcoal needs no forced draft. As long as there is a live coal as large as a pea, fresh charcoal put in with the draft doors open will soon be all aglow. I always stir up the coals before putting on fresh charcoal so as to shake down the dead ashes. Extra charcoal, enough for a half day's work, is carried in a three-quart tin can attached to one side of the furnace.

AUCTION DRIED FRUIT.

The following message was recently sent to Governor Johnson by State Market Director Harris Weinstock, who is just returning from investigation of Eastern markets:

"Investigation develops that only a limited number of eastern jobbing houses buy California dried peaches for future delivery, thus minimizing the price received by the grower. If all the dealers could be afforded an opportunity to bid on dried peaches the price to the grower would be materially increased, therefore, believe that the system of selling at public auction in eastern markets would make it possible for a dealer to supply his needs in New York on trade terms where now he has to go to the few jobbers who can contract ahead of time by reason of their large capital to pay for their purchases and thus absorb the profit which should go to the grower.

"My investigations to date show that only the middle class consumers are using California dried peaches. Few, if any of the wealthier people, and owing to excessive retail prices, scarcely any of the great masses living in the tenement districts of the great cities know anything about California dried peaches or apricots.

"Sales at public auction will bring better prices to the grower and enlarge the volume of distribution, and this, together with a campaign of publicity educating the consumer, will lead to very greatly increased consumption. With California dried fruit products, graded, standardized and labeled by the state, the product would at once command the confidence of the auction buyers and insure to growers compensatory prices and widest output."

EARLY PRUNING FAVORS APRICOT BROWN RUST.

Pruning of apricot trees where rust is prevalent should be delayed until late fall or winter, when a new growth will not result.

"The brown rust of stone fruits is widely distributed," says Professor J. T. Barrett of the Citrus Experiment Station at Riverside. "It occurs to more or less extent in every section where peaches, plums, apricots, cherries, and almonds are commercially grown.

"During the seasons of 1914 and 1915 the attacks of this fungus have been particularly severe in Southern California on apricots and peaches. The early defoliation of the trees, which in the case of apricots has been complete in certain groves this season, must necessarily affect next year's crop by not allowing the fruit wood to mature properly.

"Brown rust attacks the foliage, producing on the upper surface small yellowish spots and on the under surface corresponding rusty-brown powdery patches. The spores are produced in these rusty-brown pustules and are frequently so numerous as to give a rusty-brown appearance to the under surface of the leaves.

"A more direct loss this year is the loss of much apricot fruit owing to very early infection of the trees by the rust fungus. This early attack is now believed to be the direct result of too early pruning of the trees, this forcing out a late growth of shoots and foliage. The leaves remain on the trees over winter and until the new spring growth starts, thus harboring the fungus in a more or less active condition and making possible a very early infection of the new spring foliage. Otherwise severe infections come after the fruit has been harvested."

These Well Branched Fibrous Roots Make Silva-Bergtholdt Trees Different from all Others

Roots are the Foundation of Every Tree

Our foothill grown trees are noted for their well branched fibrous roots—well toughened bark and wood fibre—hardiness and freedom from root knot—they are more hardy—have better roots and are free from diseases common to river bottom and valley loam locations.

Fruit Growers have learned the merits of our foothill grown stock and that is why there is always such a heavy demand for Silva-Bergtholdt trees. Fruit growers know also the advantage the early buyer gets both in price and selection.

Our Trees Are True to Name

Behind Each Tree is Our Guarantee

You know now the trees you will plant. Submit to us a list of your wants and we will quote you an itemized estimate of their cost, giving you the benefit of the special prices we make to the early Fall buyer. Will also mail you our catalogue giving you accurate information as to every variety and useful information—write us now.

We know your wants—we know what the tree grower is up against. We have been fruit growers and fruit shippers as well as Nurserymen for twenty-five years. This puts us in position to advise you intelligently. Write us as to your problems and we will give you the benefit of our experience and observation.

If you want trees that will give you good service for a lifetime, write us for our catalogue and submit us a list of your wants.

We Make a Specialty of

PRUNES
French, Imperial, Robe de Sargeant, Sugar and Standard on Myrobolan root; also on Peach root.

APRICOTS
Royal, Blenheim, Newcastle Early, and all varieties—on Myrobolan, Apricot and Peach root.

ALMONDS
All standard varieties on Almond and Peach root.

WALNUTS
Franquette and San Jose Mayette, cut by R. Wiltz, the pioneer Walnut expert, from specially selected trees of absolutely true type—the highest pedigree that can be given a Walnut. Write for samples of nuts from parent trees.

SHIPPING PLUMS
Beauty, Formosa, Climax, California Blue, Diamond, Wickson, Gaviota, Kelsey, Grand Duke, Hungarian and all other varieties—on Myrobolan, Peach and Almond root.

CLINGSTONE PEACHES
Our Improved Tuscan Cling, Improved Hauss, Phillips of true type; and also other standard varieties.

CHERRIES
Royal Ann, Black Tartarian, Bing, Early Chapman, Early Burbank and Lambert on Mazzard root; also on Mahaleb.

OLIVES
All varieties grafted on Picholine root; also grown from cuttings.

Our assortment is complete in all other varieties of fruit trees and vines—write us now concerning your wants.

Bergtholdt's Special Selection for Home Orchard $3.95
This is an opportunity to get 10 fine trees of choicest varieties of fruit delivered freight prepaid for only $3.95. You can make your own selection or leave it to us and we will send you ten best grade 4-6 ft. deciduous fruit trees including one grafted walnut. Write for our list of combination offers for home planting and our free book on California fruits. Address Box A

SILVA-BERGTHOLDT Co.
NEWCASTLE -- CALIFORNIA

Our Treeless School Yards.

By John Vallance, Oakland.

Have you when traveling over our beautiful State noticed the yards around the schools? Have you noted that so many of them are treeless—not a tree or plant to be seen? You no doubt have perceived this, but did not give any further thought to the subject. I am afraid that most of us have gone no further.

Well, let us now take this matter up and consider what these dear wee boys and girls must suffer—yes, suffer!—when they have to sit in these sweat-boxes for five hours a day trying to learn their lessons.

Picture in your mind one of those unsightly buildings standing in a hot valley, the sun pouring into the windows at all times of the day, with not a particle of shade! Do you think those children can concentrate their thoughts upon their studies under such conditions? Do you think we are going to get the best out of them? Do you think it is right to subject them to such a condition of affairs through our neglect? Do you think the children will have happy recollections of their school days under such conditions?

Picture the opposite of this scene: Trees, plants and flowers around the schoolhouses; the pepper tree, a lovely evergreen that delights in our warm valley climates; the acacias, brought from their Australian home; our own beautiful redwood, cypress and pines, and the casuarina and eucalyptus, natives of the antipodes! All these evergreen trees will, if planted, soon transfer our treeless school yards into veritable shade spots. Or you can plant the catalpa, black walnut, the elm, tht locust, the maple, the Texas umbrella, and the poplar—all good deciduous trees, and which will soon afford what so many school yards so sadly lack—**shade!**

Besides these, the children themselves can plant annuals, such as mignonette, verbenas, asters, pansies, daisies, gaillardia, cosmos, coreopsis, foxglove, larkspur, marigold, nasturtium, and many others.

View this picture against the other: Here the little ones, sitting at their desks, see these beautiful flowers and trees. They can smell the fragrance of the mignonette; they can hear the birds singing and twittering in the trees. Such scenes will make them happy, will sweeten their young lives, and will in after years return to them to help them through life.

I remember when I went to school that near the schoolhouse there was a plantation of large trees; at recess I would wander over there and sit at the foot of some lofty forest giant; my thoughts would wander to tropical forests of the Amazon, or the Platte, and my desire was to visit these scenes—and I did so. I can never forget the effect those trees had on me; it is a green spot in my memory even to this day. Therefore, having so great an opportunity, let us not neglect it.

WATERPROOFING TENTING.

To the Editor: How can I waterproof 16 oz. tenting material? Have put on a coat of linseed oil, but it doesn't dry. Is there anything that will dry it without making it too siff?—D. F. C., Lemoore.

[One cupful lampblack, ½ cup graphite, one gallon boiled linseed oil gives the oil a body so that it does not soak in so much but remains pliable and dries in about one day, according to the W. A. Plummer Mfg. Co. who makes tents, etc., in San Francisco. They do not use driers in the waterproofing because driers tend to make the tents crack. —Editors.]

Fertilizer Quality

When you buy fertilizer remember you are buying what is *in* the goods and not merely a weight of two thousand pounds.

When a smelter buys gold ore he buys not merely two thousand pounds but he insists on knowing how much gold is in the ore, and you should know the amount of active nitrogen, which is the gold of the fertilizer.

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

PUMPING WATER FOR RICE.

[By Yuba County Horticultural Commissioner G. W. Harney.]

In the three principal rice growing states—Louisiana, Texas and Arkansas—all but a little over two per cent of the rice lands are supplied with irrigation water by pumping from wells.

For prairie lands the machinery is generally designed to provide seven and one-half gallons or one cubic foot of water per minute for each acre irrigated. The water is elevated fifteen to eighty feet. It is not good policy to estimate too closely in designing a plant. Some now operating in the above mentioned states are capable of delivering much more water than needed.

The development of wells has permitted the irrigation of much land that otherwise would not be planted to rice. Wells capable of supplying water for rice irrigation can be sunk in nearly all parts of the rice country and water is pumped from the sand gravel beds. Petroleum, gasoline and kerosene engines are used for pumping and in some districts where coal and wood are cheap such fuel is used. Electric power is not available.

In some of the districts, water is pumped from streams which is slightly less expensive than pumping from wells

The possibilities of rice culture in Yuba county have not been touched as yet. Water can be obtained in wells in Yuba county at depths of twenty to sixty-five feet in great abundance with cheap fuel oil for engines or cheap electric power for motors available.

So far there is but one tract in Yuba county planted to rice that is being irrigated by pumping. This experiment is being conducted by John Morrison at Ostrom station, where the water is being pumped from a sixty-five-foot well by electric power. If the experiment proves a success the rice fields will be greatly extended next year in the Ostrom section of Yuba county.

For rice culture a limited amount of water only is required. Where water is supplied from gravity ditches as in the Biggs section and the present rice fields of Yuba county, the tendency is to use too much water, which encourages the growth of weeds and pests and wastes half of the water supply.

Rice can undoubtedly be grown in Yuba county profitably by pumping the water for the required irrigation. The great advantage in pumping is that the grower will not be required to pay for any waste water and can easily control the weeds and other pests.

NEW MOTOR LAW.

Everything on wheels, from bicycles to limousines, wagons, and motor trucks, must have head and tail lights after Dec. 31. Motor vehicles other than motorcycles must have two lights in front and one red lamp behind, visible at least 500 feet away. Motor cycles and bicycles must have one white front light and a red lamp or reflex mirror behind. Wagons, etc., must have one white light on the left side, visible from before, from behind, and from the left. Front lights of motor vehicles must be permanently dimmed or directed so that the center rays strike ground not over 75 feet away.

A number plate must hang in the front and rear of every motor vehicle ecept motorcycles, which are not required to have one in front. These number plates must be fastened solidly at least 16 inches above ground and be kept clean. The rear ones must be under white light at night.

Mufflers must be used in cities and towns.

In turning on public highways, all vehicles must keep to the right of center.

Careful driving at all times is enjoined, not over 30 miles per hour on any highway, nor over 20 miles where the roadside is closely built up, nor over 15 miles in business districts, nor over 10 miles on approaching highway crossings, bridges, curves, etc.

Violation of these provisions is punishable by a maximum of $100 fine or 30 days' imprisonment for the first offense, and suspension of license for 30 days.

PERMANENT MACHINE EXHIBIT.

Among the plans for a permanent exhibit at the State Fair grounds, is the proposition to put up a machinery hall with 75,000 square feet of floor space to house exhibits which would be open to inspection the year around. It is proposed to prohibit the making of sales in the building, making it a purely educational exhibit with the primary object of furnishing a chance to compare different makes and see all the latest improvements.

Layne & Bowler PUMP

No Water Balance Used

In the old style pit pump a water balance is used to carry the weight of the shafting and runners, but as this device is in the bowls of the pump and hard to get at, it is the cause of delays and much annoyance on account of the frequency with which it gets out of order, requiring readjustment. In the LAYNE & BOWLER PUMP no water balance is used as the weight of the shafting and runners is carried on a specially designed slow speed roller bearing. This device is contained in the pumphead, where it is easy of access, and the rollers are thoroughly lubricated, as they run in an oil bath at all times, and there is absolutely no chance of their becoming overheated if a proper amount of oil is supplied. This is but one of many distinctive features found in the Layne and Bowler Pump.

Our Booklet No. 25 tells all about this famous pump. Write for a copy.

SOIL TESTING MACHINE.

A little device of interest to every farmer or agriculturist has been invented by Dr. M. O. Reiche, a graduate of the Dresden and Munich, Germany, agricultural colleges, and until recently Assistant Director of the Agricultural Experiment Station at Munich, Germany.

Dr. Reiche calls it the "Standard" Soil Tester, because the testing of the soil is all done by one standard, viz., 20 grams.

By using the "Standard" Soil Tester it is claimed that one is able to determine whether soils are acid or not, and to what degree; to as certain the carbonate contents available in the soil to a close percentage, and to distinguish whether the disclosure is of lime or of black alkali; also to determine the amount of humus in the soil.

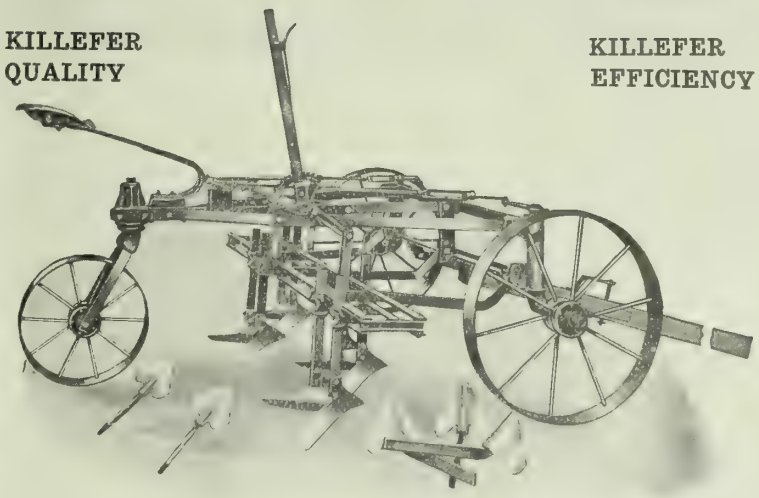
When the amount of lime, or humus, if any, in the soil is established, it gives the assurance whether the soil is in fertile, workable condition or not, and whether it is acceptable to develop further fertility by the addition of fertilizers of different kinds, based on the character of crops to be raised. Unless soils have a sufficient amount of lime and humus, they are not able to properly assimilate the fertilizer, and money spent for fertilizer, without a knowledge of the lime and humus available in the soil, may be spent uselessly.

Although it has been on the market less than a year, it is reported that many agricultural schools are already using the "Standard" Soil Tester in their demonstrations to pupils, and in their laboratories with satisfactory results.

As the expense of testing the soil with this machine is merely nominal—being only a small fraction of a cent a test, its introduction will be watched by every farmer.

TRACTOR PLOWS 12 INCHES.

"As to the Sieve-Grip tractor I have, I certainly am having good success with it. Use it for most everything that comes along. Have put it to plowing with a single, 14-inch plow 12 inches deep in hard adobe soil, where my neighbor is using four horses on a single disc averaging 6 inches deep. No comparison as to the quality of the work," writes L. M. Higgins of Carpinteria.



"I have taken a picture of a load of thirty-six 80-lb. sacks of beans on a stone-boat, making a load of 3000 lbs. or 80 per cent of the weight of the tractor. This shows you the braw-bar pull

"It is my pride with the engine to be able to work the ground close and well and save all the hard work that I can. In fact, I do not expect to use a hoe in the orchards again until next summer. Neither do I intend to have a horse in the field to do something I can't do with the Sieve-Grip."

GAS TANK LEAKED.

Gasoline entered the exhaust pipe of a motor truck being used on the highway in Monterey county and the driver jumped just as the tank exploded. The truck ran on down the hill into a ditch and burned up. A beautiful ring of smoke that could be seen a mile was sent up at the explosion. Moral—take care of your gasoline tank and pipes unless you want to take part in some impromptu fireworks.

Beet Cultivator
KILLEFER QUALITY
KILLEFER EFFICIENCY

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequences the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turnbuckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheels that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

The Killefer Manufacturing Co.
2209-21 Santa Fe Ave. Los Angeles, Cal.

IRON AND STEEL HIGHER.

Pig iron advanced in price one-half more in November than in the four months previous. Pittsburg dealers are going 1000 miles for scrap iron. The steel trade has recently been wildly excited, and prices have advanced more rapidly than ever before. Steel mills have discontinued making contracts in many lines, except with specifications on hand; and then only for delivery several months in the future. Differences of $6 to $10 per ton are found on steel sold late in 1915 as compared with early in the same year. Tractor, engine, pump, and machinery manufacturers are affected. Will consumers of these articles buy as much at advanced prices as before? "The Iron Age" notes that while steel prices have been advancing, the structural steel trade has been the quietest of all steel-consuming trades and that the export trade is almost at a standstill because the mills cannot insure delivery. If these should take on new activity or there should be continued demand for steel for war, prices may go still higher during the next year or two.

A demonstration of the Yuba Ball Tread Tractor will be made to responsible parties on their own property. In requesting, address

The Yuba Construction Company
Department A-22
433 California Street, San Francisco, Cal.

General Agricultural Review.

CITRUS FRUITS.

Butte county figures on $300,000 for its orange crop.

The Riverside district had shipped 69 cars of oranges and 25 of lemons Dec. 23.

From 3½ acres of 3 year trees, Henry Koenig of Woodlake picked 150 boxes of oranges.

A lot of 25,000 citrus trees has been shipped to Yuba county for planting in Brown's Valley.

Lindsay won sweepstakes at the last National Orange Show, but is rather tardy about preparations to defend the cup this year.

Dean H. J. Webber of the Riverside Experiment Station suggests the possibility of finding frost resistant citrus varieties among the seedlings growing at the Station.

Orange shipments to Dec. 21 have been 1132 cars from Porterville, 1479 from Lindsay, 676 from Exeter and the Visalia Electric, and 72 from Strathmore, a total of 3359.

Butte county citrus growers are being agitated to protest against sweating, seemingly to distract attention from their non-observance of the 8 to 1 test. The Stewart Fruit Co. is making a strong bid for unstandardized business.

The U. S. Dept. Agr. is sending three men east with four cars of fruit from the Merryman ranch at Exeter to keep records of temperatures and other conditions en route. Three cars are packed in cars with false floors and storage batteries to keep an even temperature. Frozen fruit has often been found in the floor tiers and near the doors.

G. Harold Powell reports greatly increased sales of oranges at higher prices than for corresponding weeks in most previous years, a preference in the East for California oranges over Florida's, a rather short navel crop but prospects for a heavy increase of Valencias. Lemons have been in exceptional demand, though the crop is 12 per cent greater than usual.

OLIVES AND NUTS.

Off grade walnuts will be sold this year by the Ass'n for each district separately.

The Esparto Chamber of Commerce is already planning the second almond festival, to be held next October.

Goleta walnut growers have received over $150,000 for their crop besides the returns to growers who are under the Ass'n umbrella, but do not help to hold it up.

A ripe olive packer says the demand for good ripe olives is increasing; that there is only one thing to hinder the growth of this demand; that is supplying inferior fruit put up by inexperienced picklers.

The "Southern California Walnut Co.," a concern outside of the Cal. Walnut Growers' Ass'n, is reported to have been kicked out of Reno, Nevada, because only 24 per cent of their unbleached nuts were good and only 41 per cent of the bleached were fit for food.

DECIDUOUS TREE FRUITS.

Nevada and Placer county tree planting has started.

Winters' peach growers signed up $2560 in the State organization Dec. 20.

Wenatchee, Wash., apple growers have found ready demand for quarter-boxes.

A carload of nursery trees for planting was recently received in Sutter county.

J. E. Bergtholdt of Newcastle reports a good demand for trees throughout upper California.

Prune planting in the Russian river country is booming, especially in vineyards, where vines are being replaced with trees.

It is announced that the dried peach organization now forming will likely handle canning peaches also when it gets to going.

Local meetings of the peach organization subscribers will be held Jan. 5 to nominate 25 trustees to be voted on at the mass meeting Jan. 12.

The First National Bank of Selma directors subscribed $500 each to the peach organization besides the regular share per acre of fruit grown by them.

Sixty-four pounds of Ben Davis apples were grown on a four-year tree in sandy loam near Porterville, by Bud Kincade. One of them weighs 12 ounces.

Sec. Hooker of the Hood River Apple Growers' Ass'n will address a meeting of the Beaumont Fruit Growers' Ass'n and the public in general on Jan. 15.

Brazil last year obtained 1 per cent of her prunes from California and 99 per cent from Europe. The State Marketing Commission hopes to reverse the percentages.

Hayward Reed, who has just returned from Australia, expects to ship some pears to that country next season. He picked a bag of ripe cherries there in November.

Napa County Farm Adviser H. J. Baade conducted a novel pruning demonstration. One member of the party would prune a tree, and the rest would criticize the job, each taking his turn at pruning.

Shipments of the 1915 crop dried fruit by sea almost equalled those of 1914, despite the Panama Canal slides. Sec. H. P. Dimond of the Dried Fruit Ass'n of Cal. reports in-

PLANTERS Are Safe When Purchasing

ROEDING TRUE TREES FRESNO, CAL.

Plant walnuts for profit. Our stock is scientifically grown and is, we believe, the finest on the market. We call particular attention to our magnificent trees of the "Vrooman strain" of the **FRANQUETTE, THE STANDARD VARIETY FOR GENERAL PLANTING.** We can also supply Mayette, Mayette Rouge, Parisienne, Placentia Perfection, etc. We advise planting grafted walnuts only and will advise with you the reasons why. Write us for suggestions and prices.

Walnuts

Our stock is complete and the assortment includes all the leading varieties of Oranges, Lemons, Pomelos, Limes, etc. Our trees have long been known for their superior quality, sturdiness and the fine quality of fruit they produce. Our trees are budded from bearing stock of known value. Our packing facilities are the best and we can deliver you these trees in the very best condition. We are offering special inducements. Write us.

Citrus Trees

For many years we have been recognized as the leading Olive growers in the State. Our stock is grown in soils especially adapted to olive culture. We are safe in saying that our olive trees are the finest that can be produced. We grow all the leading varieties, such as Manzanillo, Mission, etc Whether you are thinking of planting 5 or 5000 it will pay you to get our quotations.

Olives

We are headquarters for Ornamental trees and roses. We have a splendid stock of all varieties of Cypress, Cedars, Pines, Palms, hardy Evergreen Shrubs, Field Grown Roses, etc. We shall be pleased to be of service to any who contemplate beautifying their grounds, and will gladly offer suggestions without charge to our customers. Write for information in reference to our special **LANDSCAPE SERVICE,** for laying out grounds, parks, subdivisions, cemeteries, ranches, street planting, school grounds, colony development, etc.

Ornamentals

Every Planter Should Have a Copy of Our Catalogue

Every planter should have a copy of our new 1916 illustrated catalogue, which lists and prices over 2000 varieties of citrus and deciduous fruit and ornamental trees, vines, plants, shrubs, as well as evergreens, palms, roses, etc. It is the most complete price catalogue that we have ever issued. Write for a copy. It will be sent free to any address.

Name and Address.....

spection of nearly 30,000 tons to go by sea.

Old almond trees in Yolo have been formed, usually, with too many main branches, according to Farm Adviser N. P. Searls, who recently held a pruning demonstration of young apricots, almonds, apples, peaches, plums, prunes, grapes, and olives, to illustrate how to avoid removal, later, of big limbs.

The Central Committee for the peach growers' organization is reported to have recommended election of trustees by districts as follows: Sacramento Valley 5, Fresno county 10, Kings county 4, Tulare county 3, Merced county 1, Madera county 1, Stanislaus county 1. San Joaquin county seems to be left out, though several large subscriptions have been taken there.

GRAPES AND SMALL FRUITS.

J. G. Onstott of Sutter county is preparing 160 acres for Thompsons.

Resistant stock is not good for Thompson Seedless in Sutter county according to H. A. Walton, Jr.

After discussion before the Sutter county supervisors it was recently decided to retain the ordinance prohibiting the importation of rooted cuttings.

H. A. Hyde of Monterey county recently received what is said to be the first carload of strawberry plants that ever crossed the continent. These came from Maryland. He expects another carload from Oregon soon.

C. H. Holley of Tulare county shipped a car of 932 crates of Emperors Nov. 24, which sold in Chicago for $2,014.50. These grapes had recovered from frosting, by leaving them on the vines about two weeks.

Despite the brandy tax which it was vociferously asserted last spring would ruin the wine, table, and raisin grape industries, wine grape growers in San Joaquin and Napa counties are to receive cash for the grapes where they expected to be paid in wine.

Foothill vineyardists of Tulare county have been suffering from black rot. Emil Gundelfinger has been applying lessons learned from the Japanese and feels certain that the remedy is Bordeaux spray just before blooming and if necessary again after the grapes begin to set.

GRAIN AND FIELD CROPS.

Bluestem wheat sold at $1.02 per bushel at Portland Dec. 23. A strong demand for shipment to Europe is reported.

In the sorghum trials on the farm of Young Bros. of Alameda county, both brown durra and white Egyptian corn yielded at the rate of over 2500 pounds per acre according to Farm Adviser C. W. Rubel.

Fifteen women husked 150 bushels of corn as a surprise for a Pennsylvania farmer, charging him $3.75. He gave them a banquet at $1 per plate and at the next election woman suffrage carried three to one.

The State Water Commission will spend $1500 for investigation of economical use of water in rice growing. Frank Adams of the U. S. Dept. Agr. will have charge, the department appropriating $1500 more.

Rice plantings next season are estimated as follows: Butte 25,000 acres, Colusa 9000, Yolo 9000, Yuba 5000, Glenn 2000, Kern 8000, Fresno 1500, Tulare 2000, Kings, Merced and Stanislaus 2000; total 63,500, or over double the 1915 planting.

From 400 acres of Sutter county land P. J. Hiatt is reported to have sold $38,000 worth of white beans, $7500 of broom corn and seed, besides alfalfa. He expects to put in 1000 acres of beans next spring, using three tractors to work up a seed bed quickly.

There is a general temporary lull in the rice markets of U. S. About 35 per cent of the crop is in the hands of growers according to Sec. G. E. Harvey of the Pacific Rice Growers' Ass'n, and it is to the interest of all to hold firmly for better prices. California growers have held exceedingly well.

The Moulton Irrigated Land Co. of Colusa county is reported to have several thousand acres of rice. Their tenants are required by contract to plant seed inspected and approved by the company's seed expert and to keep water grass out of the fields. If the weeds are not kept out the company reserves the right to do the work and charge the cost to the crop, insuring payment by mortgage executed in connection with the lease.

MISCELLANEOUS.

The Gilroy Farmers' Union elected J. M. White president, J. G. Ross vice-pres't., G. A. Moore sec.-treas., and Mrs. J. M. White chaplain.

RELIABLE TREES AND VINES

Established 1888. WHOLESALE GROWERS of Deciduous and Citrus Fruit Trees, Olives, Shade and Ornamental Trees, Grape Vines, etc. Our largest order last year was for 200,000 Deciduous Trees. This customer advises that he has 98 per cent stand. Let us supply your order this season—large or small. What do you expect to plant? Address Main Office, 2501 Tulare Street, Fresno, California.

Sulphuric Acid Neutralizes Black Alkali.

That alkali lands may be reclaimed by treatment with sulphuric acid is pointed to very strongly by experiments of the Univ. of Calif.

These new hopes of alkali-reclamation are based on investigations carried out in pot experiments in the greenhouse in Berkeley, and in field experiments in small plots at Kearney Park near Fresno. The field experiments, used to confirm the pot experiments, are even more striking in their results.

The action of the sulphuric acid is three-fold: it entirely neutralizes sodium carbonate, the corrosive "black alkali" salt; it shrinks the jelly-like, easily-swelled materials in the soil, known as "colloids," which are put into a very badly diffused and swollen condition by the washing out of salt by the winter rains or by irrigation; it sets free some chlorine from the common salt, therefore changing all alkali that does remain into sodium sulphate.

Sodium sulphate is the least harmful of the three salts common in alkali land. Plants can stand very much more of that salt than of the others, and besides, sodium sulphate is less soluble than the other salts. Not only sodium sulphate, but also calcium sulphate, magnesium sulphate, and other metallic sulphates are formed, and these have been found to have the power to prevent the poisonous action of sodium sulphate and of other salts. Therefore, through changing the corrosive "black alkali" salt into sodium sulphate, driving off chlorine from the common salt, and making that into sodium sulphate, by shrinking the "colloids" (or jelly-like, easily-swelled materials), and by producing calcium and magnesium sulphates, the soil can be changed into one containing only one kind of salt, and by the shrinkage of the colloids can be made much more pervious to air, and therefore a more favorable place for the necessary bacteria and fungi to live in.

Milking Market-Milk Producers.

(Continued from page one.)

receives about 13 cents per gallon on the Los Angeles market.

With no investment in cattle, farm lands and dairy equipment, the city dealer has taken a gouge out of the consumer to the tune of several hundred thousand dollars annually, and while the gouging was good took a rap at the producer for about a quarter million dollars annually. The worst of it is, cheap butter and rapid development of dairy lands are playing into his hands for more of the same kind of medicine unless some check is placed on his resourcefulness. No one blames him for taking advantage of the circumstances and feathering his own nest, but there is an uprising brewing among dairymen supplying milk to San Francisco and Los Angeles that points toward his regulation in the very near future.

Co-operation to the Front.—Co-operation is being prescribed as the most likely cure of the present disease in both the southern and northern part of the State. In the north this plan is being fostered by an older co-operative milk producers' organization known as the Bay Counties Dairy Co., a concern which has been an "in and out" factor in maintaining better prices for producers tributary to the Bay Cities for some time. In Los Angeles an entirely new organization has been perfected and is known as the California Associated Milk Producers' Ass'n. The avowed purpose of both organizations is "to make the distributor be good or else step on his toes."

After an exhaustive study of the northern field and market, a committee of five leading dairymen have submitted the following proposal:

They recommend the forming of a corporation with a capital stock of $100,000, of which amount $45,000 must be subscribed before any subscriptions shall become operative. Each stockholder will bind himself to ship his entire output, for a given period, to the company and the company will then become owner of it and sell it for the highest market price.

Milk will be paid for according to the butterfat test and the stockholders will receive the full amount received for the milk, less the actual cost of selling and five per cent on the stock investment, for depreciation, etc. The directors will fix a certain basic price and will pay the members on that basis monthly, pro rating the surplus at the end of the year after deducting the above mentioned items.

The stock will be subscribed for at the rate of $25 for each 10 gallons of milk the producer contracts with the company for, thus allowing stockholders a voting strength in proportion to the amount of milk he contracts for. Only half of this amount will be paid for upon the foundation of the company, the balance being payable at the option of the directors, but not earlier than June 1, 1916, and then only in monthly installments. The committee points out that the $12.50 per share only equals three-eighths of a cent a gallon and that a reduction of more than that amount is probable the coming year unless the proposed organization is formulated.

What Will Be Done with the Money.—With this amount of money, the committee recommends that the company erect a milk depot in San Francisco, suitably located and large enough to handle all the milk sold by members to the company. It is advised to have this depot complete in every detail, and equipped with paraphernalia that will allow the company to enter into the wholesale distributing business, at such times as it cannot in other ways secure a fair market price for its members' product.

It is not the plan of the committee to enter the retail field, as that would entail a much larger sum of money as facilities for covering the entire city would be necessary. They will simply do a wholesale business and be prepared to dictate to the distributor rather than be dictated to, as at present.

That the remedy is timely, and entirely practicable from a producers' standpoint is evidenced by a late report from Secretary F. X. McGuire, who has been soliciting subscriptions for the proposed company. He reports that he already has $36,000 subscribed and expects to raise the other $9,000 in less than a month's time. The proposal is being taken up with the new State Market Commissioner, who will probably be asked to appoint one of the directors.

Similar success is reported from Los Angeles, although that association's plan is somewhat different and does not embrace such quick action.

With the product of approximately 50,000 cows at stake in these two cities alone, producers in smaller cities in which conditions are even worse than above outlined will watch the accomplishments of these associations with more than ordinary interest.

TOO MUCH WATER DECREASES ALFALFA YIELDS.

More water means less instead of more alfalfa, once a certain limit has been reached. This is the valuable lesson of a six-year field test just completed at the University Farm at Davis. It was shown that, contrary to accepted belief, a limit is soon reached above which the yield of alfalfa actually decreases with increasing amounts of irrigation water.

In these tests, quarter-acre checks were used, and each test was duplicated. Quantities of water varying from 12 to 60 inches were applied to the various checks. Two checks were left unirrigated. The average yield for six years from the unirrigated checks was 4.07 tons of hay per acre.

The largest average yield, 9.28 tons, was produced by applying 36 acre-inches of water per acre, in 4 nine-inch irrigations.

But the most economical yield was produced with 30 acre-inches of water per acre applied in four 7½-inch irrigations, 8.99 tons of alfalfa hay being produced. The average increase in yield of .29 tons per acre by using 36 instead of 30 inches in a season was not sufficient to pay for the increased cost in water and labor. Between nothing and 30 inches, the yields increased uniformly with the increased amounts of water applied.

A slight decrease in yield was shown from four 12-inch irrigations, while a decided decrease resulted from four 15-inch irrigations, which produced but 8.20 tons of hay per acre.

At the end of the six-year test a fair stand of alfalfa still remained on all checks excepting those receiving either no irrigation, 12 inches, or 60 inches per season. In the latter, not more than thirty per cent of the original stand remained.

HEALTHY CALVES DIE.

To the Editor: I have lost four calves this fall. They were from healthy cows and were very strong and lively when born. They suck the cows dry but soon get weak and unable to milk even from a bottle.—D. H., Madison.

[These calves are over-fed at birth. Cut down the ration ½ to ⅔.]

What Wisconsin Dairy Contest Did.

[Written for Pacific Rural Press.]

Since the announcement in this journal in our last issue that the University of California is to hold a dairy cow competition similar to the one conducted in Wisconsin, several years ago, subscribers have asked for fuller information concerning the contest and the scope and results obtained by the Wisconsin test.

Detailed instructions will be included in the circular which is now in the hands of the University printer, also the method by which the prizes will be distributed. These will be ready for free distribution in about two weeks. In the meantime we are giving a summary of the main facts brought out in the Wisconsin test which is furnished us by Prof. Woll.

He says: "Over 500 cows were entered in the competition, of which all but 58 were purebreds of the Jersey, Guernsey and Holstein breeds. They were owned by fifty-six different breeders and dairy farmers. About half of the owners had never had cows in their herds tested for production before, and among them were many new breeders who had only recently built up their dairy herds. The awards for monthly records of production, for which Hoard's Dairyman offered a special prize of $25 a month for the two years, were won by 24 cows owned by seventeen different breeders, the records ranging from 92.37 to 40.65 pounds of butter-fat toward the end of the lactation period. The average production of these cows was 72.3 pounds of butterfat, equivalent to about 85 pounds of commercial butter or nearly 3 pounds for each day of the month. Complete yearly records of production were obtained for 395 cows, viz., for 158 Holsteins; 157 Guernseys and 80 Jerseys. As records for two full years were secured for three Jersey cows, the number of yearly records obtained aggregated 398. The highest of these was that of the Holstein cow, Caroline Paul Parthenia, 77784, producing nearly 23,000 lbs. of milk; 2800 lbs. of solids and 888.2 lbs. of butter-fat during the record year. The largest production of ten cows in a herd was about 16,000 lbs. of milk; 2,000 lbs. solids and 589.7 lbs. of butter-fat. One of the important points that the records secured in the competition brought out was that the large cows within each breed were, as a general rule, heavy eaters and large producers; they yielded larger net returns and a more economical dairy production so far as feed consumption is concerned, than that of the smaller cows with a lower capacity for feed consumption and dairy production. The highest producing cow in the competition yielded over 300 per cent more butter fat, her feed cost 168 per cent more, and she produced 675 per cent higher net returns, than the lowest producing cow, and still the latter cow 'was not to be sneezed at.' She was a good deal better cow than the average dairy cow in this or any other state in the Union, being credited with a production of 218.7 lbs. butter-fat for the year. which is not far from 50 per cent above the average yearly production of cows in the state.

"The enormous difference in the production and profitableness of different cows was, therefore, brought out very strongly by the results of the competition, and naturally set many farmers to thinking and to considering in which class their own cows were, with the inevitable result that improvement and greater profits from the herd followed.

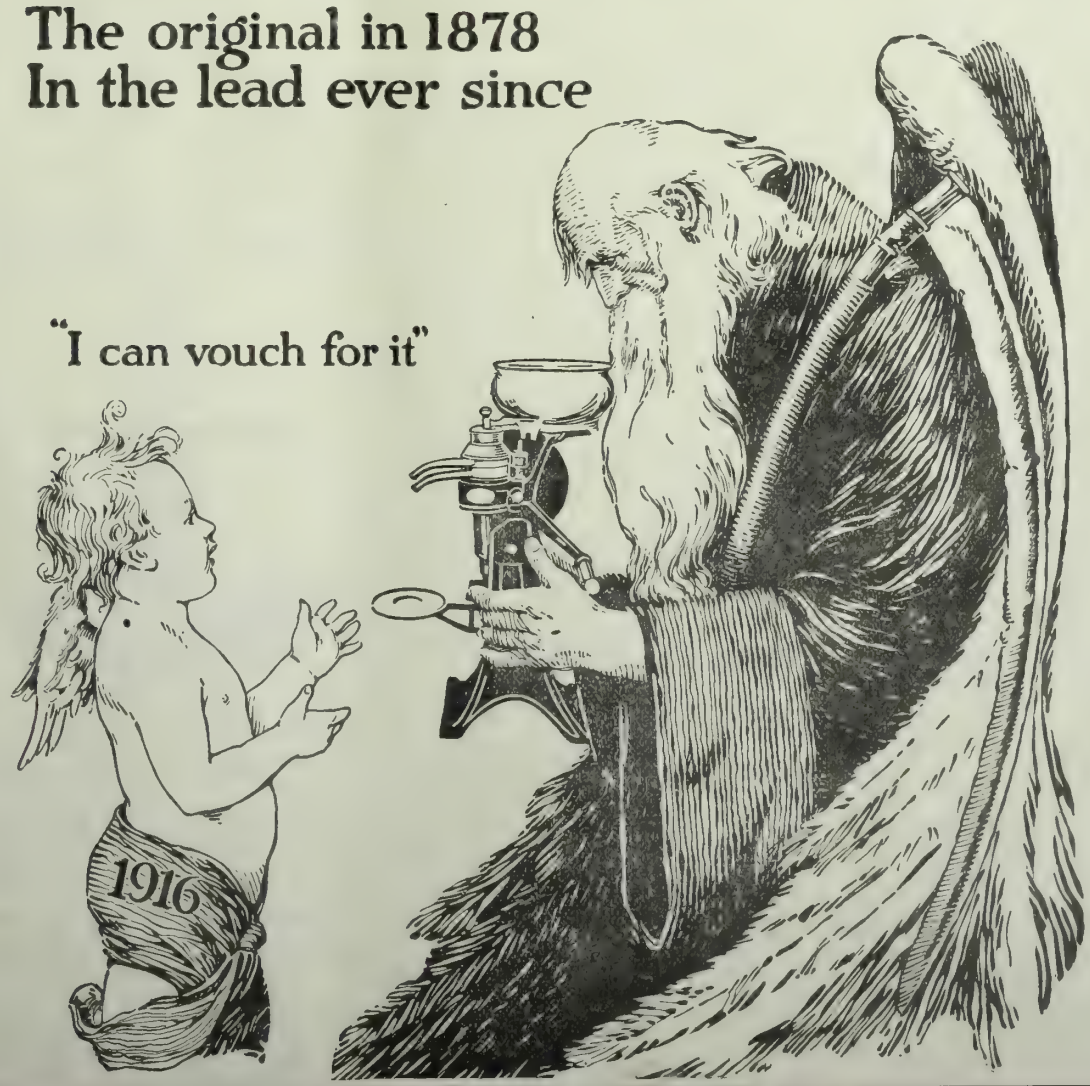
"The educational value of the competition was, for this reason, of the highest importance, not only to Wisconsin dairy farmers, but to all who followed the records made in the competition during its progress and the discussions to which these gave rise. Many new breeders were led through it to take up the work of official testing and gradually became centers for the dissemination of knowledge of modern management of dairy herds in their respective communities. Through them, neighbors and friends in different parts of the state learned how to better feed and care for their cows and were thus able to materially increase the profits from their herds The publications of the large records made by the competition formed an incentive to others to try to do as well; the cumulative effect of the competition in this respect has doubtless been of even greater importance to the dairying industry of Wisconsin and other states than the immediate results of the competition.

"Finally, through the competition were obtained authenticated records of production of milk, solids and butter fat and the feed consumption of some 400 cows for an entire year under normal conditions of dairy management. These data as published form invaluable material for the study of questions relating to the management of dairy herds, including the breeding, feeding and dairy production of the modern dairy cow, and have been frequently used in the past by speakers and writers on dairy subjects."

SIMPLIFIED CORRAL CLEANING.

[Written for Pacific Rural Press.]

On the John Edwards dairy near Keyes, Stanislaus county, most of the heavy work of corral cleaning has been overcome by the erection of a manure-loading platform.



This platform is nine feet wide and has a base of 15 feet in length made of 2 by 4 framing lumber. It is six feet high in front and slopes down to the ground in the back, thus making an incline runway covered with 1x12 boards, laid lengthwise, and extending some six or seven feet beyond the frame work at the high point, being supported by an extension of the frame work of the platform. This extension, however, has an opening the width of the platform and about three feet across, about 18 inches from the end of the extension. A block and tackle equipped with a steel cable is fastened onto the high end of the platform. After plowing the corral and scraping the manure to the foot of the platform a team is hitched to one end of the steel cable and a scraperful of manure to the other. In this way the scraper is pulled to the top of the incline where it is dumped through the opening in the platform extension, into the manure spreader stationed beneath. This saves practically all of the pitching usually necessary and allows thorough cleaning in much less time. The platform can be built with a small amount of rough lumber and by putting it on runners it can be hauled to any point in the corral.

The KROGH Vertical Pumps

New Type Vertical.

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film; absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.

Get our Bulletin No. 78 before deciding on a pump.

NEW ENGLAND CALIFORNIA CORPORATION.
RIPON. CALIF.

SHEEP.

Sheap shearing in New Zealand has advanced from $4.86 per 100 head to $5.46.

All lines of sheep were advanced Dec. 20 at Portland Union Stock Yards and choice lambs were selling at $7.25 to $7.60, wethers at $6.50, and ewes at $5.75.

The New Zealand wool clip is estimated at 575,000 bales, 15,000 more than 1914. Home mills take 20,000 bales, leaving 555,000 for export.

Herbert Johns of Butte county is negotiating for a Shasta county ranch on which he expects to raise 400 acres alfalfa to feed sheep in winter.

Competition from Australian wool is expected to be less next year, especially the cheap grades. The London market shows a shortage of good class wools.

E. J. Johnson of Enterprise, Ore., took three cars of sheep to Portland last week selling lambs at $7.60, ewes at $5.75, and yearlings at $6.75.

The American Cheviot Sheep Society will hold its annual meeting at Hartwick, N. Y., Jan. 15. Election of officers by mail vote. Early registration of lambs is urged.

Record prices were reached at the first New Zealand wool sale for the season, which was held at Christchurch on November 11. There were 5,548 bales offered of the different classes and grades, with Southdown ewe and half-bred wools at the head at 20 pence (40 cents) per pound in several cases, Corriedale hoggets at 19¼ pence (38½ cents). Little wool brought less than 15 pence (30 cents). The advance over last year's prices ranged from 4 cents for the lower grades to 7 cents for some of the better classes. Much of this wool was purchased by American firms.

HORSES.

Wayne Dinsmore of the Percheron society writes: Have just received a cablegram from President Aveline of the Percheron Society of France, exact translation of which is as follows: "Exportation of two hundred stallions, foaled in 1912 or earlier, authorized."

The following rules have been enforced in securing consignments for the Second Annual Consignment Sale of draft horses to be held at Davis, February 2, by the California Draft Horse Breders' Ass'n: Stallions 3 years or under may be guaranteed or not at the option of the seller; for stallions over 3 years evidence must be furnished that the horse is a breeder. In case of mares of breeding age, a statement must be made as to the date of birth of last foal. Stallions offered for sale must comply with the State Stallion Registration Law as to soundness. A competent veterinarian will be on hand to make inspections.

Oregon, California, and Nevada recently joined in asking aid of the U. S. Dept. Agr. in stamping out rabies of coyotes and dogs in the States mentioned.

COW HAS SCOURING SPELLS.

To the Editor: There are times when my cow scours badly, does not give as much milk as usual, and seems to be stiff in the mornings She has been milking 10 months and is six months along with her second calf. Stable is dry. She gets all the alfalfa hay she can eat and some crushed barley at night.—P. F. P., Fresno.

[Cut out half the alfalfa hay and substitute oat hay. Give six 30-grain tablets sulpho-carbonates compound twice daily.]

CARRUTHERS FARMS—Berkshires and Shorthorns. Mayfield, Cal.

The California Hog Book

ONE of the most comprehensive books that have been published on the breeding and management of hogs comes to the Rural Spirit from the press of the Pacific Rural Press, San Francisco, Cal. The author is W. S. Guilford, who possesses, first of all, a practical knowledge of the things which he writes in this volume through being associated for a great many years with his father in Illinois in the breeding of hogs, and from his study of the scientific end of the business at the University of Wisconsin, Mr. Guilford, as director of the Sacramento Valley Irrigation Company, found hogs, rightly managed, to be one of the greatest aids to farmers under the irrigation system which he represents, and there being no text book that fitted the conditions, wrote one. His volume leaves very little for the reader to guess. There is something in it for the men just starting in hog breeding, and who know absolutely nothing about it, and there is a great deal of value within its pages for the man who has been in the business for years. While the book was written primarily for California conditions, it is easily adapted to the Pacific Northwest.—Rural Spirit.

More and Better Hogs in California.

HOGS PER ACRE ALFALFA.

To the Editor: How many hogs can one expect to sell from an acre of alfalfa producing 8 tons per season. How many from 80 acres if all the alfalfa is fed to them together with barley or corn to balance the ration.—J. W. D., Redding.

[Answered by Prof. J. I. Thompson, University Farm.]

[When grain is fed to hogs in addition to alfalfa pasture, it seems reasonable to expect about 500 pounds of pork per acre to be produced that should be credited to the alfalfa, when the yield is about the average. Alfalfa that will yield around 8 tons should produce in the neighborhood of 650 pounds of pork per acre.

An acre should carry about 2500 pounds of pork at one time. This would mean about 12 200-pound hogs. Eighty acres on the average would carry in the neighborhood of 800 pigs and the brood sows necessary to produce them. Of course, it would necessitate very good care and management to get desirable results from an area handled entirely in this way.]

PIGS IN BARN.

Perhaps you can't build a hog shed now but have barn room unused. Henry Webb of Madera has almost ideal conditions for his sows and pigs by keeping them in 14 different pens built around the inside of the hay barn with cheap panels. "It is surprising how quick you can do the work when they are fixed that way," says he.

Mutton Sheep on Small Farms.

[By R. E. Reynolds, Ore. Agr. College.]

EWES NEED EXERCISE.

A good example of what a difference exercise will make in producing strong, healthy lambs was to be seen last winter in two flocks of ewes owned by the College. One flock was kept on a hill farm where they had the run of a large pasture on rolling, well-drained land. These ewes had an old barn, open on two sides, for shelter and where they were fed oat and vetch hay once a day. The other flock of ewes were kept at the College on rather flat, wet land, with no pasture at all and no exercise other than what they got in small lots. They had to be fed all feed eaten. These ewes kept fatter than those on the hill-pasture, but in the spring they did not lamb nearly as high a per cent of lambs. Nor were their lambs as strong and vigorous as the others, and a large number of them required considerable care and attention at birth. The lamb crop of the ewes on the hill pasture where they were out and had plenty of exercise was not only larger and better than those from the confined ewes but was also produced at much less cost.

Sheep barns or sheds need not be expensive so long as they are on a high, well-drained piece of ground and free from drafts of air. In fact, very expensive and close barns are often detrimental, for they are hard to keep properly ventilated, they get too warm, and the sheep are much more apt to catch cold when kept in an overheated barn or shed.

All doors and gates should be made wide, for sheep when frightened all try to go through at once, often jamming ewes against the sides of the door or gate and causing abortion. Keep plenty of salt before the sheep at all times.

If panels are not already a part of the sheep equipment, provide a few of them, for they always come in handy and are a great help at lambing time. With a little care and attention the lamb crop in the spring can often be materially increased, and in the small flock the breeder should strive to produce as many twins as possible, for with a little extra care and attention, a ewe will raise a pair of twins practically as well as only one lamb.

ANTELOPE VALLEY NOTES.

"Since I did not study animal industry while at the University, and since I am now in the hog business, I am looking for authoritative information all the time. Each week the Press is read thoroughly at each one of my ranches and especially the articles on hogs. Enclosed is my check for a 'California Hog Book,'" writes Donald Graham of Lancaster, under date of Nov. 12.

"During the last summer I put two purebred Duroc-Jersey boars and forty grade sows on my alfalfa ranch. We have had fair success so far; we expect to do better from now on, for we are going to put up a closed house and have things more conveniently arranged. I am strong for the hog business and hope to make a big success of it. We are so fixed that we can raise our own grain for fattening.

Several people are beginning to raise good hogs here. Most of them have purebred boars and grade sows; one man is raising purebred Berkshires. I believe that many more will be raising hogs a year from now because of the fine alfalfa produced, the quantity of grains, and the feterita, etc., that can be raised easily and well. That we are close to Los Angeles is a big factor.

"With the hog business beginning well, the dairy business coming to the front, and the orchard business proved, we have a fine chance in this valley, which in time will surprise the wise ones.

"During the past two months the alfalfa men have been in their glory with hay $12.00 and more f. o. b. Lancaster. Now they are getting $15.00.

"A recent rain of .35 to .5 inches has made the grain farmer feel good. It is said that many thousands of acres will be farmed for grain this year which have not been plowed for 15 years. Most of the grain farming in the valley is done in the west end 30 to 50 miles from the railroad. I heard that the Tejon Ranch had leased a lot of pasture land for grain. Of course these fellows do not get any such yields as the people in the northern valleys do, but they seem to live. Some men have done some extensive pear and almond planting in the elevated parts of the valley.

"Just now I am having a large well put in to supply water for my pear orchard which will be three years old in March. My well is to be 16 inches in diameter to 150 feet; from there to 600 feet it is to be 10 inches in diameter."

28.9 lb. Holstein Bull 14 Months Old $500

His Dam, Korndyke Ormsby 2nd as a 7-year-old, made in 7 days 28.61 lbs butter 2d, test 4.26. His Dam, Korndyke Ormsby Hengerveld has a 30.74-lb record and three A. R. O. daughters. In his sire he combined the blood of Creamelle Vale, second only in milk production to Tilly Veeman, official record 1155.85 lbs. of butter from 29,592.7 lbs. milk, and the great sires Dutchland Sir Pietertje Hengerveld who has 15 A. R. O. daughters; Pieterje Hengerveld Count De Kol with 42 A. R. O. daughters and Pontiac Butter Boy, one of the real great sires of the breed.

The Bull is a dandy, straight, nicely marked, being half white. He is just what you are looking for and is worth twice what I am asking.

Write, or better, come and see him.

F. H. STENZEL, San Lorenzo, Cal.

STARVATION FOR CHOLERA.

To the Editor: In the latest Rural Press R. D. S. inquires what to do for white scours in calves. I will give my experience with this plague.

I had a registered heifer calf which began to scour badly on the third day—white scours I'd call it. Scoured for about a day then began to pass large quantities of mucous. As I lost a calf from this same cow last year, I at once began heroic treatment of this one, the principle of which is starvation. Remember that a good strong calf can live for several days without a bit of feed, so do not fear to shut down on the scouring calf. First I gave an ounce of castor oil with 20 drops of turpentine in a pint of boiled milk; 24 hours later began feeding once a day 1 pint boiled milk with 2 raw eggs, and once daily a pint of well cooked oatmeal gruel, strained, with 2 raw eggs; and always a tablet of sulphocarbolates in each feed. The castor oil and turpentine gets rid of the mucus, though I had to resort to it three times in a week; and always after using it delayed feeding for 24 hours. This was a good strong calf and I had her on this short ration a little over 2 weeks, before increasing her feed, which has always been boiled milk. This was six weeks ago and now I have as nice a calf as one may find anywhere. The sulphocarbolates are good but they won't stop the mucus and as long as mucus is thrown off, the stomach can't digest a thing. Right at present these tablets are nearly impossible to obtain, selling at $60 per thousand, but I happened to remember that a neighbor had spoken of having a lot so I got some of him. There were none in our town.

Merced. E. W. Doane.

[The treatment outlined above is the best one can use, though the dose of sulpho-carbolates is too small; and larger doses will bring quicker result. These tablets can and should be bought at retail for not more than $30 per thousand. In my practice have used many and various treatments and experience has shown that Abbott's Sulpho-corbolates come as near being a specific for this trouble as anything we now have. Use two to three tablets two or three times a day as needed (30 grain tablets). Where calves are very valuable and will stand the expense, vaccination at birth is the treatment par excellence.]

HOGS PARALYZED.

To the Editor: Some of my hogs get paralyzed in one hind quarter and lose control of it. Have been feeding skim milk and horse beans Is methylene blue a good remedy for abortion?—Sub., Decoto.

[Cut out the use of horse beans in the feeding of these pigs. Give each two to four ounces of Epsom salts depending on their size. Follow this with 15 grain doses potassium iodide twice a day for two weeks. Methylene Blue is not a sure cure for abortion and is too expensive at present to experiment with.]

COWS DON'T BREED.

To the Editor: Some of my cows do not get with calf, though they are served at frequent intervals. I have three young purebred bulls which I keep separate from the cows and I also keep the cows up twelve hours after service.—A. P., King City.

[An examination would be necessary to accurately determine your trouble, but try the following, which in any case would be indicated: Douch these animals out daily with one gallon 1 to 1000 solution of potassium permanganate for one week; then use two ounces cooking soda in one gallon of water for a douch for another week. You have very probably a catarrhal condition of the vagina which this may overcome.]

HOLE UNDER JAW.

To the Editor: My mare has a hole under her jaw from which matter has been running two months.—E. E., Linne.

[This is a fistula or opening into the mouth. It should be treated by a veterinarian, who will be guided by his examination of the opening.]

COWS PASS BLOOD.

To the Editor: I have a cow and heifer both with the same trouble. About a day after they are in heat they pass blood, whether they have been to a bull or not.—A. R. G., Garrison, Tex.

[Use the same treatment as outlined for A. P., King City, in this issue.]

DOES NOT COME IN HEAT.

To the Editor: A cow had a calf in June and has not come in heat since. She is in good condition.—L. V. P., Escalon.

[This animal retained a part of her afterbirth, and there is a chance that she will always remain sterile. Give her two pounds of Epsom salts dissolved in a gallon of water at one dose. Follow this up with fluid extract of nux vomica in one-dram doses twice a day for one week.]

BUCK'S HEAD TURNED.

To the Editor: Our New Zealand buck had canker of the ear. Peroxide seemed to heal the canker, but suddenly his head fell over to one side, one eye bulges out, and he rolls over in trying to walk. He won't eat anything but mush and milk and weeds, but is fat.—J. M. B., Lathrop.

[The canker was not treated soon enough and has attacked the inner ear. You had better destroy this animal.]

RECENT RINGBONE.

To the Editor: My old mare got a ringbone since last June. The lump is about two inches in diameter. Applied horse blister and later Gombault's Caustic Balsam with no results. Limps slightly in trotting.—T. K., Lincoln.

[Rub in tincture of iodine with a toothbrush over the swelling every day until blistered, then wait a day or two and begin again; continue this treatment for about six weeks or two months.]

CALVES HAVE SCOURS.

To the Editor: Many in this neighborhood are losing young calves with what appears to be more than ordinary scours. I lost four last year and two this winter. I used every precaution in cleaning and disinfecting stall. I lost a calf a day ago. Used niter, liquid rubard, and magnesia. Four calves born in the field are doing fine.—O. H. R., Turlock.

[Paint the navels of all newborn calves as soon after birth as possible with tincture of iodine. Make this a habit as part of your routine work; and if the trouble shows up after this cut the ration of the calf in half immediately and give two or three sulpho-carbolates 30 grain tablets three times a day in water or milk.]

FIRST ANNUAL AUCTION SALE

—OF—

PURE BRED HOGS

under the auspices of the

California Swine Breeders' Association

will be held at the

State Fair Grounds

SACRAMENTO, JANUARY 27, 1916

100 head of pure-bred hogs of various breeds will be sold. These represent the TOPS of some of the best herds to be found in California. All hogs sold will be registered and be GUARANTEED BREEDERS by the consignors.

Catalogue ready about January 12th, and may be secured of

J. L. THATCHER, Riverside, Cal. OR J. I. THOMPSON, Davis, Cal.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

GOOD HENS MOLT QUICKLY.

To the Editor: How can I handle my hens to obtain a short and satisfactory molt? At one time I thought I knew a little about this matter, but the past year have read so many opinions that appeared in the poultry papers I am now thoroughly bewildered.—C. J., Santa Rosa.

[Eggs and feathers are both made from the food that is digested by the hen. The hen that has the capacity to consume and assimilate large quantities of feed is able to produce many eggs, while the hen that does not or cannot consume and digest the same amount of feed must naturally, under parallel conditions of care and attention, lay fewer eggs. The same rule applies to molting hens in this way: The hen that has the capacity to consume and digest abundant feed is able to quickly build up a new coat of feathers while the one with inferior capacity must take a longer time. In laying contests the record making hens often lay and molt at the same time. As a general rule, however, the heavy layer molts quickly and very late in the season; often sheds her entire plumage within a week or two leaving her covered with nothing but pin feathers or feathers that are only partly formed. Therefore it would seem that in order to possess a flock of hens that will molt satisfactorily it is necessary to keep only those that are great producers of eggs.]

PHEASANT RAISING.

To the Editor: Please furnish information regarding pheasant raising, their care, proper feed, etc.—B. C., Winters.

[It is seldom that a successful breeder of poultry or pigeons experiences any serious difficulty in raising pheasants. Many of the most extensive breeders rear their baby pheasants on dry mixed infant chick feed and depend on poultry scratch feed for the chief article of food for grown birds. We know of one successful breeder who prefers the ready-mixed pigeon feed. All of these are generally sold by feed dealers. Pheasants require green feed, grit, shell, and charcoal as well as ground bone. Bone is as necessary for growing pheasants as it is for young turkeys. We can supply a small booklet entitled Pheasant Culture that contains information valuable to beginners for 25 cents postpaid.]

POULTRY AND ORCHARD.

To the Editor: I intend starting a poultry plant in conjunction with a young orchard and wish information on the arrangement, dimensions, and design of pens and houses, also the number of birds it is advisable to keep in one pen. Can you recommend some standard work that will cover these points? Will you also give me some idea of the quantity of feed a chicken should have?—E. B. B., Orosi.

[Without considerable detailed informtaion as to the soil, condition of the land, etc., it is not practical to give specific advice on these subjects in this department where space is limited. We recommend our correspondent to read "California Poultry Practice" which is published by the Pacific Rural Press and in which, among many other matters of interest to beginners, a number of houses are described and illustrated.

The amount of feed a laying hen will consume in a year depends on the number of eggs she lays. Approximately 75 pounds of feed is required by a hen laying from 120 to 150 eggs per year.]

POULTRY NEWS NOTES.

[Written for Pacific Rural Press by Geo. H. Croley.]

The largest single shipment of turkeys ever made from the Imperial Valley was forwarded on December 17th. The shipment consisted of nearly 4,000 birds and were forwarded in four cars. Each car contained 80 coops with an average of about 12 turkeys to each coop.

The Stanislaus Poultry and Pet Stock Association held its annual meeting and election of officers recently at Modesto. E. H. Green was re-elected president of the body for a second term. Other officers chosen are: Vice-president, E. O. Trask; reasurer, L. J. High; secretary, J. D. Yates; assistant secretary, Ed. Whitmore.

The Pomona Valley Poultry Breeders' Ass'n voted to participate in the proposed summer school of poultry husbandry which it is anticipated will be held next June in Riverside.

The Santa Ana Chamber of Commerce donated to the Orange County Fanciers' Association as special prizes, trophy cups valued at $50. This is a recently formed association which has absorbed the Orange County Bantam and Aviary Club. C. A. Greenleaf of Santa Ana is president and Mrs. J. C. Parks of Orange is secretary.

The Tulare Co-operative Poultry Association reports an increase for November of about $300 over the total business of November, 1914.

During the first ten months of 1915 Kings County exported $60,000 worth of poultry, day-old chicks and eggs for hatching. The shipments of fowls and eggs were sent westward as far as Japan and East as far as New York, while baby chicks went to Oregon, Nevada, and Arizona.

TURKEY HENS PER TOM.

To the Editor: I wish to keep 20 hen turkeys the coming season. How many toms should I have? Is a young tom or an old one preferable for young hens?—Sub., Patterson.

Ans'd by A M Hart, Clements .....

[My experience shows that if the tom is strong and vigorous, he is sufficient for the 20 hens; otherwise, use two. One tom is generally mated with 15 hens. Use young toms with old hens and yearling toms with young hens.]

LIME OR PITCH FOR RATS.

To the Editor: Tell your correspondent to put air-slaked lime in the holes and runways. Rats' feet are damp, lime sticks to them. The feet smart and the rat licks his feet. His tongue smarts and he takes himself to new quarters. Fresh pine pitch will have the same desired effect. I have tried both with good results Jno. R. Longacre.

Fresno.

A deer skull and antlers imbedded in a tree were recently cut out and fixed up for a table by an Oakland man. It was found in Humboldt Co.

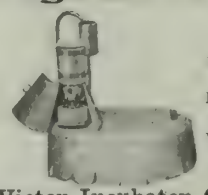
Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1⅜ inches then 20 inches of 2¼ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line



It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

PREPARING FOR HATCHING.

Preparedness is a good word, and it got quite a send-off the past few months by the former President T. R. of "strenuous" fame. Teddy has a vocabulary that expresses his feelings and this preparedness can be used in many places to good effect.

For poultry work we certainly need to be prepared ahead of time. If we are thinking of hatching we should first of all know about the eggs. Are we using our own? Then we must know and prepare weeks ahead for the proper condition of the hens, the male birds, and know how they are being fed, exercised, etc.

Caring for the Eggs.—Eggs that are to be hatched should never be laid on the side, until they go in the incubator or nest; they lie that way long enough. Put in a cool place where the temperature is not likely to be lower than 50 or higher than 70. Place in clean fillers in a dry airy place and keep covered. Some place them in bran, but they do very well if kept dry in the fillers. Dampness is not good for them, any more than changes of temperature. If it is handy to turn the case over, so that the eggs rest one day on the large end and next day on the small end it may be a little improvement, but I have done both ways and never noticed the difference. A good strong germ is not easily killed, but if the germs are weak, "handle with care"; if strong they will hold their own with proper handling.

Don't keep the eggs too long, and always remember that while eggs will hatch after being kept three weeks, you will get a bigger hatch and stronger chicks from eggs one week or under.

Circumstances sometimes force us to hold eggs over, but the fact to bear in mind is that the fresher the eggs, the stronger the chicks, all other things being equal.

Disinfected Incubators.—Now for the incubator. If you cleaned it thoroughly when you last used it and it has been in a clean, dry place it will need but a little spraying with creolin and water, a tablespoonful to a quart of rather hot water, and see that all parts get some. If the incubator has been laid away dirty, doors open and damp and dust in the air, it may be that mice have made it their home as fitting company for the germs and other gay fellows that are holding carnival, just waiting for you to light that lamp that means "hatching time for their broods, but death to yours." If this is the case, I will consider myself a poor teacher. But in case it is, open up the doors, take out all the trays, drawers, smoke pipes, and everything movable and examine them for mouse nests, spider nests, etc., then spray with the creolin and water, leave it to dry a day or two, then spray again if it does not smell right.

Clean your lamp burner, put in a fresh supply of good oil; never try to incubate with cheap oil. Some incubators will run with it, but the fumes are likely to get in your egg chamber and damage the hatch. Put a fresh, clean wick in the lamp and start it up, let it burn and run several days in case there is any smell, then spray again, and by the time that is done, not before, your incubator it fit for the eggs. There are more eggs ruined by dirty incubators than anyone knows of and it could all be avoided.

HOW TO RAISE CHICKS.

To begin with, we will take Black Minorcas. The chicks always come out black and white. Some people think because they have white on them they are not purebred, but that is a mistake. Also a great many people say they like Black Minorcas, but the chicks are so hard to raise that they do not buy them. Now I have raised a great many Black Minorca chicks and I cannot agree with these people.

But they have one weakness, and that is rain. Keep Minorcas dry and they will be as hardy as any chicks under the sun. Get them wet and they droop and wilt.

Now when one is working in the dark, as it were, one wonders why it is that one chick will not stand the same conditions that another will, but when we look at it in the right light we find it is merely a matter of temeprament. Human beings have not got anything on bird or animal life, for all have temperament.

We aim to keep Minorca chicks out of the rain until two months old, then they will stand anything that comes their way. Give plenty of good, wholesome feed, and milk if you have it, to make bone. Then you will have good, strong, rangy pullets that will lay you premium eggs from start to finish. No gambling about size or weight of Minorca eggs, or the number they lay; they are there with the goods.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word

ROOFDEN CHICKS are hatching every week. When do you want yours? White Leghorns that are worth while, by hundred or thousand. Black Minorcas, beauties, great layers of big eggs, and a hardy strain. MRS. BEST'S BULLETIN.

My dear Friends:

While chatting with you of the city's displays and shopping, please remember that my one wish is to be interesting. That is why I report the frivolous as well as the practical. If there were no variety of things, there would be no such thing as Taste, and there would be no thrill in deciding what we like, and it would be a dull old life. So I babble of everything as I come to it, and while it is still novel. For as Shakespeare says:

"The rose is fairest when 'tis budding new."

Well, here are some things that appear to be, more or less, "budding new."

I am waiting for a good rainy day and the first enterprising fashionable to appear in the new oiled silk rain coat. It is so light and transparent that the texture and color of the gown can be seen through it. At first glance one must resemble a deep sea fisherman. There is no question, however, that the coat will turn any rain that ever fell, or any spray that ever blew.

A great welcome is being given the wool caps to match sweaters. These caps are especially adapted for seasonable wear by schoolgirls, while for hikes or automobile rides they are a boon generally: and cheap.

Fur keeps to the fore (I claim to be guiltless of any groping toward a pun). It is best described as "nifty," the effect of it around shoetops, hats, collars, sleeves and skirts. The shoetop use of it is possible because of the high skirts being worn.

Going back to raincoats for a moment, there are some very natty ones in gay-colored rubber or "gossamer" cloth that are reasonable in price, and new in cut.

The gray suede glove, which is very serviceable, especially at this time of year, is in favor again. It is dressy always.

There's a laugh for the children in Charlie Chaplin jumping jacks (15c) being sold on the sidewalks They are made of lithographed cardboard, and the eyes move with the arms and legs.

The beau market is being heavily bombarded this winter by the confectionaries with art candy boxes. On the tops of them are handpainted, sometimes very elaborate, works of art. Often the boxes are priced at twice the cost of the best candy they can hold.

A dressing table tray and set of iridescent-glazed chinaware at $5 was a novelty to catch the roving eye.

When I see those rather mischievous silk stockings with the dark feet and flesh-colored tops, or other light colored tops, I admit that they will give a startling effect. There is no doubt of it.

A new walking coat that gives an atmosphere of decided tone is of dull green, wash leather. Moreover, it should last forever. In the East it would be in favor as a skating jacket.

A new and snappy-appearing boot for misses comes in two shades of tan, one color for the upper as a whole, and the other for the toes and reinforcement.

Combing jackets of various kinds of toweling continue to receive attention, and the price seems to vary with the expense of the embroidering on them.

In closing I will say that a Celtic lady friend of mine with twinkling eye has just wished me a "Happy New Year and may your combings be less." Wishing the same to all,

I am faithfully,

ROSABELLA BEST.

(Note—Readers wishing information from Mrs. Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

SPANISH BEEF STEW.

(This Week's Preferred Recipe.)

In this California dish, popular wherever it is known, a most satisfying culinary result is achieved. Cut 1½ pounds of cross rib beef (an economical and very valuable part) into small pieces. Have a few ounces of suet, and also cut this up and fry it so that you will render about 4 tablespoonfuls of fat out of it; take this hot fat and brown or sear the meat in it, using the stewpan you are going to cook the meat in; at the same time cut up and fry an onion with it. Now sprinkle four tablespoonfuls of flour into the stewpan; add 1 pint of dry kidney beans that have been soaked in water over night, a 5c can of tomato sauce, 1-3 clove of garlic, and cover all with three pints of water. Cook three hours slowly. For this stew boiled rice is a good side dish.

A MOTHERS' PROGRAM.

Sometimes at a meeting of mothers' clubs in the schools there is some difficulty in fixing upon just the right kind of program to make the session what it should be. Here is one program that went very well:

Instrumental duet
Report reading
Vocal duet.
Address, "The Morals of Children"
A travel talk
Vocal duet.

Another meeting was devoted to music and an informal discussion, the subjects being "What Failures Do Parents Find in Schools?" and "What Failures Do Schools Find in Parents?" This makes it almost a debate, as there is plenty of room for argument on both sides, and not unprofitable argument at that.

Where the parents are being entertained by the children, the program that follows may furnish some hints: song, recitations, calisthenic exhibition, song, French vineyard dance by girls, recitation, duet, chorus, recitations, song, pantomime, piano duet, chorus.

A fine way of securing co-operation between the pupils and parents and teachers is to stimulate interest by presenting a handsome pennant to the class bringing out the most parents to a Mothers' Club affair.

THIS WEEK'S BEST HOUSEHOLD HELP.

To provide children a breakfast they won't become tired of—give them chocolate when they become tired of milk. It is as cheap as milk and they will like it as long as you can give it to them. Use the prepared ground chocolate, 1 level teaspoonful of chocolate to each cup of milk, adding also a pinch of salt and 1-3 teaspoonful of sugar to each. Put this on the stove, let it come to the boiling point and serve.

Chocolate is also a much cheaper and more nourishing breakfast drink for adults than coffee.

PEACEABLE HISTORY.

The California State Board of Education will give prominence to peace, rather than prominence to war in California text books hereafter. In the history of the fifth and sixth grades, now being prepared, the Board demanded more about the accomplishments of Thomas A. Edison and Goethals, and not so much about the fighting ability of General Grant.

A COUGH RELIEF.

It is the season of the year when coughs and colds are encountered. A good home-made cough relief is made by taking three tablespoonfuls of whole flaxseed and one pint of seeded raisins, chop the raisins and mix them with the flaxseed. Add three pints of water and cook down to a quart. Add the juice of a large lemon to the mixture and sweeten to taste. The children will take this cough remedy without any coaxing, once they try it.

Officer!—May—Carpets are curious things, mamma. Although they are bought by the yard, they are worn out by the feet.—Chicago Herald.

MEET THE LITTLE PIG THAT STAYED AT HOME!

Since this picture arrived in the office there has been by common choice a new name selected for it: **"The Little Pig That Stayed at Home."** For here, behold it, with everybody else in the Pig family gone away, receiving from its kind owner the consolation earned by lingering devotedly in the old homestead. A bright little pig, too, for a month old—since it understands the bottle as well as a human baby a dozen months old. Anyone that had a little pig like this, as pretty and as precocious, would feed it from a bottle, too, and let it stay at home as long as it cared.

"Helping Mother Out."
(From Fair Oaks Ranch, Willits, Cal.)

DOMESTIC SCIENCE WITH A VENGEANCE.

The "ring of iron" round Germany has tried the efficiency of that efficient nation as never before. So far it has survived and its emergency education of its people in household science and economy has done part of the wonder.

In Berlin much of this education has been through the Central Committee of the Housewives' Association, which besides conducting a permanent exhibition of the hundreds of substitutes for ordinary luxuries and necessities, also gives lessons in their use; and courses in buying, mending, cooking, diet, hygiene, etc.

Some of the economies discovered are: a sort of celluloid underwear that can be washed without going to the laundry; composition cooking vessels instead of copper; twine of paper instead of cotton; an artificial rubber instead of the real thing, for baby bottle nipples, diapers, etc.; iron pipes gilded instead of brass curtain rods, paper collars, cuffs, handkerchiefs and tablecloths.

DON'T SLIGHT THE MILL.

Some people treat teeth as if they had been provided them through an oversight. They eat without regard to chewing what they eat.

If they have any thoughts about this it is likely that they suppose they are saving wear and tear on their teeth and cheating the dentist. What they are doing, though, is making friends with the doctor. They are much like owners of a mill through which they pass the grain without grinding, and then swallow it as if it had been made digestible by the mere virtue of passing through.

Chew your food well. Unchewed food makes a horse sick, and it will make a man sick or a child sick. Besides, the digestive organs for all the struggle they make can extract the nutriment from but a small portion of the bulk of what is eaten, and loss results thereby. Your brain and body is kept up to its highest efficiency by the food which you digest, but the food can not do this if it merely parades, so to speak, through the alimentary canal.

The opposite mistake is made when food too fine forms the whole menu. The mechanical part of chewing is not all—there must be chewing for the sake of mixing the saliva. So it were best if every meal had some coarse food with it that required the services of the mill. In that way, the fine food and the coarse are properly made ready for digestion by the teeth and saliva.

FIGHTING A PEST.

The twenty-five million prairie dogs that inhabit the pasture ranges of New Mexico and Arizona destroy enough grass to support a million cows or five million sheep. Therefore the government, acting on an appeal by the stockmen, has employed men to wage a systematic warfare of extermination upon the little creatures. But it will be a long war, for the enemy is widely distributed and deeply entrenched.

WHEN MANDY STARTS TO WASH.

When Mandy sets th' b'iler on,
An' hustles up th' fire,
An' starts a-stirrin' up of starch
An' h'ists her sleeves up higher,
W'y, then you know th' war is on,
It ain't no time to josh.
Th' on'y thing to do is—git,
When Mandy starts to wash.

Cold beans an' bread an' coffee's all
I git to eat that day,
An' 'tain't no use to stay eround
An' git in Mandy's way
Fer then she'll set me hard at work
A-rinsin' out—ker-splosh!
Ye can't stay round th' house an' shirk
When Mandy starts to wash.

An' so I kinder hem eround
'At my terbacker's out,
Fer down at Job's (th' corner store)
Th' boys all set about
A-lookin' jest as sheepish-like
An 'chawing crackers—Gosh!
I ain't the on'y shiftless one
When Mandy starts to wash.

'Nen I go amblin' down th' road,
A-feelin' sneaky-like,
To jine in with th' other boys
'At's sorter out on strike;
A feller can't help feelin' mean
'S long as he can't josh,
Th' on'y thing ter do is—git
When Mandy starts to wash.
—Lippincott's.

MRS. JINKS STARTS A LAWN.

By F. Fairfield.

When Jim and I settled down, retired-like, in a bran new home, the first we'd ever had of our own, the builder left us with a front yard full of kindling, plaster, dry bunches of weed, pieces of tar paper, tin, wire and a sense of desolation. Right then I said we'd have a lawn. It'd look better.

There was a Jap came riding by on a bicycle and I hailed him. I says, "I want a lawn that will last me a life time. How much will it cost?"

He grinned, and said, "Thirty-five cents hour."

"That would bankrupt me," says I, "inside of a month." But then I remembered it meant work by the hour, not lawn by the hour. If he didn't take a lifetime to make it, the Jap could get a lawn finished inside of ten or twelve dollars. "Go to it," I said, "but you want to look sharp, or your first hour will be your last 35 cents."

Did you ever see a Jap use a rake? He doesn't use it to rake with—not the way I see People do. He coaxes it over the clods as if apologizing for the rake pushing between them. There's nothing violent about it. He goes at it mincingly. He'll stay on one spot until the ground becomes about the consistency of brown sugar. He "plays" it with the rake. I watched, and I know. It reminded me of combing a baby's hair. This one did it that way, but of course it was after he'd picked all the sticks and stones and barrel hoops off the lot, and had spaded it up. I'm speaking of the second day, I am. When he got nearly through raking I said if he intended to give it any more finishing touches I'd fetch him out a camel's-hair brush to do it with. But he didn't understand me.

I ought to have stated that there was about two loads of stale, dark, rusty-looking, dry manure turned over into it when it was being spaded, although I'm sure we could have afforded the fresh article.

He went and got some grass seed, too, and pounded it into the ground until the ground was pretty hard—just after he'd fined it so nicely! He sprinkled it and said he'd be back after the grass began growing and the bill for the manure and seed would be about $9. I hadn't thought about paying for extras. I supposed he was furnishing all that. So I paid him for his time and told him not to come back, for he might take a notion to apply gold leaf to the lawn and I wouldn't know how much that'd come to until too late.

When he'd gone, and I'd paid the bill for the extras, there was a man came with a wheelbarrow full of regular manure, and I stopped him and bought it and had him put it all over the top of the lawn like I'd seen in some places.

There was a lovely little rain soon, and you could just see that lawn rise up out of the ground. Every day it looked prettier to me. It also looked pretty to the dogs of the neighborhood, and the big ones would sink up to their ankles in it. It's funny, but I never saw a dog in our yard until it was cleaned up and carpety. I suppose they all felt like Queen Elizabeth walking on Sir Walter Raleigh's cloak of velvet and gloried in it. Some of them liked it so well that they romped in it.

When most of it was about two inches high I could see we were going to have about eleven varieties of grass. "Anything to escape monotony," says I. But my brother visited us and he knows grass. Seeing my lawn, it was his cue to point out which was mustard and which was dandelion, and which was dock, and which was wild carrot and which was tar weed and which was thistle, milkweed, wild oats and so on. He said it was from the manure that had been put on top—it was too new and the seeds hadn't rotted. The grass, he said, would have a hard time struggling through if I didn't pull out the weeds.

Well, that's what I did between rains—pull weeds. I figure that each weed had to be pulled three times, since as fast as I'd pull it another would pop up in its place. I was sorry I ever started doing that, but my brother told me it was best unless I was trying for an arboretum. An arboretum is a plantation of all kinds of trees and shrubs, and hardly more than one of each.

Finally I got the lawn looking free of rare and exotic vegetation; also looking sparsely upholstered like a Mexican dog. I think there was between four and five blades of Australian rye grass and one authentic little patch of white Dutch clover.

Jim, my husband, came out one day and asked if he could help. He'd been passive. He hadn't let the lawn get his goat. A man who's spent his whole life at sea and in boarding houses doesn't take a lawn seriously. But he stood there stuffing tobacco in his pipe and asked if he could help me.

"Yes," I said, "go get the buttonhole scissors and trim the edge of this lawn, and then put a glass tumbler over this sprout. I think it's another blade of grass."

PICTURES.

The Home Circle editor will consider publishing odd pictures of farm pets if the pictures are good. Send with a stamped and addressed envelope for reply.

"John"—

"We are almost out of chocolate. Get a 3-lb. can of Ghirardelli's Ground Chocolate. Don't buy the bulk kind."

And John "obeyed orders" cheerfully, for of all the members of the household, John, the "boss," likes his breakfast cup of Ghirardelli's the most.

He knows what a delicious, sustaining beverage it is, what wonderful cakes, puddings and cookies his wife makes with its aid. He also knows that it gives the highest food value for the man who works hard, for the woman who must always be well, for children on the grow.

The Markets.

San Francisco, Dec. 29, 1915.

WHEAT.

The recent advance in primary markets has caused some response here this week, northern bluestem and the better grades of red wheat being slightly higher. Local business, however, has been extremely dull through the holidays.

Cal. Club, ctl.	$1.70 @1.72½
Northern Bluestem.	1.80 @1.82½
Northern Club	1.72½ @1.75
Northern Red	1.65 @1.80

BARLEY.

Spot barley has eased off a little, with some sales below the figures quoted, but there has not been enough business to warrant a reduction in the quotations, most offerings being steadily held. Future business also is dull, with prices nominal.

Shipping, ctl.	$1.30@1.35
Choice Feed, ctl.	1.30@1.32½

OATS.

Business has been limited to small jobbing sales of feed, both demand and spot supply being light. Red feed is rather easy, as some off-grade stock is coming in and is hard to dispose of.

Red Feed	$1.30@1.35
Red Seed	1.45@1.65
White	1.35@1.40

CORN.

Eastern yellow has been marked up a little, following a stiffening in primary markets, and any California yellow that is ready for market should bring about the same figures. Other varieties are in very good demand for feeding in the country, but trading here has not been active for the past fortnight.

Eastern yellow, ctl.	$1.70@1.75
Milo Maize	1.35@1.40
Kaffir	1.65@1.70
Egyptian	1.25@1.55

BEANS.

Business is very quiet on all grades at present, and while a revival is expected early in the month it is impossible to make predictions. There is a sufficiently confident feeling among holders, however, to keep prices very firm, and large whites and limas are held at a slight advance. Horse beans in marketable shape are very scarce, and prices have stiffened greatly.

(On wharf, San Francisco.)

Bayos, per ctl	$5.00@5.10
Blackeyes	3.50@3.60
Cranberry Beans	5.10@5 20
Horse Beans	3.25@3.50
Small whites (south)	5.60@5.70
Large Whites	5.60@5.75
Pinks	4.25@4.30
Limas (south)	4.60@4.70
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65

SEEDS.

Prices are steadily maintained as before. The demand has been somewhat less active this week, and it is believed that the principal movement in most lines is over for the present.

Alfalfa, per lb	18 @19 c
Melilotus Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

A little more hay has come in during the last week, but shipments are still much lighter than a few weeks ago. There is a heavy demand for stock hay in the country, as a great deal of feeding is being done, and little of this grade is appearing here. There is some local demand, and the result is an advance in the price here. Most of the offerings are of medium grades, and with only a moderate demand through the holidays, prices are unchanged. Alfalfa shows less firmness, with better supplies. Dealers predict a better demand here in the near future, and the large movement to country points has greatly reduced the supply.

No. 1 Wheat	$12.00@15.00
No. 2	10.00@11.50
Tame Oats	10.00@16.50
Wild Oats	8.00@11.50
Alfalfa	10.00@14.00
Stock Hay	6.00@ 9.00
Straw, per bale	.25@ .40

FEEDSTUFFS.

Prices on all lines stand as last quoted. Local trading has been subject to the customary holiday curtailment, but there is a good consuming demand through the country, and more activity here is expected before long.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$20.50@21.50
Alfalfa Meal, per ton.	18.00@20.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	25.00@26.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	38.00@39.00
Middlings	32.00@33.00
Rolled Barley	26.50@27.50
Rolled Oats	29.50@31.00

VEGETABLES.

The market for all lines of garden produce has been exceptionally dull since the holiday, and while some improvement is expected toward the end of the week, prices so far have been rather inclined to easiness. Offerings in many lines, however, are limited, with much of the stock coming from the south, so quotations show no great change. Rhubarb has come in rather slowly the last few days, and cleans up well at the old figures. Southern peas and beans are also steady, with limited supplies. Tomatoes receive little attention, and 90c is about the best figure at present. Celery and lettuce are doing fairly well.

Sprouts, lb	3@ 4 c
Rhubarb, box	$1.00@1.25
Peas, southern, lb.	.08@ .10
String Beans	.08@ .12
Lima Beans	.08@ .10
Peppers, bell, lb	.05@ .06
Tomatoes, L. A., crate	.75@ .90
Eggplant, lb	.05@ .07
Celery, crate	2.25@2.50
Artichokes, doz.	.50@1.00
Lettuce, small, crate	1.00@1.25

POTATOES AND ONIONS.

Both potatoes and onions from the Delta district are beginning to clean up, and prices show a corresponding firmness. Potatoes from outside points, however, are in ample supply. Sweets are higher, with diminishing stocks, and onions are beginning to come in from Oregon at higher prices.

(On Wharf.)

Oregon Burbanks	$1.25@1.50
Salinas Burbanks	1.85@1.90
Delta Burbanks	.85@1.25
Sweet Potatoes, ctl.	1.30@1.50
Onions, Delta, ctl.	.75@1.00
Oregon	1.00@1.50
Garlic, per lb	10@12½c

POULTRY.

Large arrivals of turkeys expected for the holiday failed to show up, and the market advanced to extreme figures before the close. Since then the usual reaction has been noted in all lines of poultry, lack of demand causing a drop in prices of broilers and fryers, as well as turkeys. The latter, however are in some demand for New Year, and hold up fairly well.

Turkeys, dressed, young	24@28c
Old	20@22c
Live Turkeys, old, lb	18@20c
do, young	19@21c
Broilers, 15 lbs to doz. and less, lb	30c
do, over 15 lbs. to doz.	23@25c
Fryers	21@22c
Hens, extra, per lb	16@17c
Small	15@16c
Smooth Young Roosters, per lb.	17@19c
Squabs, per doz	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb	15@16c
Old	13@14c
Belgian Hares	9@10c

BUTTER.

A fair holiday demand and shipping requirements stiffened the market up a little toward the close of last week, and while there was a slight reaction Monday, heavy sales since then have cleaned up current offerings and caused an advance on all grades.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	27	27	—	26	28	28
Prime Firsts	25	26	—	25	26½	27
Firsts	24	24	—	24	25½	25½

EGGS.

The market continues to show abrupt fluctuations, as arrivals vary greatly from day to day, while extras move slowly at the higher figures. Offerings were quite liberal before the holiday, and prices showed some reduction in spite of the extra demand. Since then sales have been only moderate, while arrivals are quite large for this time of year.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	40½	38	—	39	36½	34½
Sel. Pullets	31½	29½	—	29	29	27½

CHEESE.

Y. A.'s keep all the firmness noted last week, offerings being light, while flats are moving slowly and show another decline. Monterey cheese also has reacted from the recent advance.

Y. A.'s fancy	17 c
Fancy Calif. flats, per lb.	14½c
Calif. Cheddar flats, per lb.	Nominal
Monterey Cheese	17@18c

LOS ANGELES DAIRY PRICES.

Eggs	38	37	35	—	35	35

DECIDUOUS FRUITS.

Pears are cleaned up, and persimmons nearly so. Only a few cranberries are left, and with a fair demand they are firmly held. Apples are steady at unchanged prices, the local demand being rather less active than last week, though there is some shipping inquiry and the market is in fair condition.

Cranberries, Eastern bbl.	$11.50@12.50
Oregon, box	3.50@ 3.75
Apples, Newtown	.75@ 1.25
Pearmain	1.00@ 1.25
Oregon Spitzenbergs	1.50@2.50
Lady Apples, box	2.00@ 2.25
Persimmons, box	.75@ 1.25

DRIED FRUITS.

There is little feature in any department of the dried fruit market at present, the only quotable change being a slight narrowing of the range on apricots, in the direction of higher prices. As this fruit is almost entirely cleaned up, the change is of little interest to most growers. Apples receive little attention. In other lines, though little trading is to be expected until after the inventory season, there appears to be a better demand than usual for this time of year. The trade throughout the country is believed to have little stock, as early purchases were light, and holiday consuming demands turned out well. It is accordingly believed that, when inventories are finished and the actual paucity of supplies is fully appreciated, there will be a renewed demand from domestic buyers. Figs are in good demand, with light offerings of foreign stock, and large prunes are much in demand. Peaches are getting fairly well cleaned up, and there will no doubt be considerable demand by spring. The New York Journal of Commerce says:

"The light buying which has featured the market for several days continues, with purchasers in practically all quarters displaying very little interest in the general situation.

"It is the general opinion among the New York brokers that the future California prune market will exhibit a much better feeling after the turn of the year, when buyers are expected to begin purchasing once more. In anticipation of this movement the larger packers have refused to dispose of any of their stocks at low prices."

Apples	6½ @7½ c
Apricots, per lb.	9 @12 c
Figs, white	5 @6 c
Black	3½c

Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50 lb. box	2.75

CITRUS FRUITS.

In spite of a slight reduction in the price of California navel oranges on the eastern markets, the returns are very good and the larger part of the crop shipped before Christmas has brought better prices than has obtained for the same period for several seasons past. On the New York auction, Monday, Dec. 27th. California navels averaged from $1.75 to $3.15 per box. Lemons sold for $2.55 to $3.80 On the same day the Boston market averaged higher than the above prices, while Chicago averaged $2.55 to $3.25 for navels, and $3.50 to $4.25 per box for lemons.

Up to Dec. 27th there had been shipped from southern California 1005 cars of oranges and 781 cars of lemons; from Tulare county 3370 cars oranges and 55 of lemons; from northern California 512 cars of oranges.

Oranges have been in very good demand locally all week, with the retail trade stocking up freely, and prices in general are well maintained, though only fancy lots will bring the top figures. Seedling grapefruit also is slightly easier, with ample supplies, though there is quite a good call.

(Wholesale prices, San Francisco)

Oranges, Navels	$1.50@2.75
Tangerines	1.50@2.00
Grapefruit, new crop	2.00@2.50
Lemons, box	1.50@3.75
Lemonettes, box	1.50@1.75

HONEY.

Water white grades are in strong demand, and any available supplies should find ready sale at good prices. Of other than fancy grades, however, the local trade has rather more than enough for current needs, and

Special Live Stock Market Report.

The market here has been decidedly dull the past week on account of the holidays, consumption of beef reaching the lowest mark for many years. There are quite a few cattle being offered now, attributed to the scarcity of hay in some parts of Nevada and the usual offerings from the feed lots at this time of the year. While a few cattle may be bought reasonably, there seems to be no reason for cattle owners to be at all uneasy about the market as cattle are bound to be more or less scarce in March and April. Supplies piled up in the yards this week on account of the short consumption but packers are not apt to kill heavy enough to further break the already weak market.

Sheep and lambs are showing a little more strength, but nothing like the livestock market justifies. Stubble lambs are practically all cleaned up now and except for the supply in Nevada and California feed lots. Packers will have to look to Utah and Idaho for their lambs.

Hog receipts eased up some both here and in the Eastern market. An advance of 30 cents was recorded the first two days this week on the Chicago markets and receipts were smaller. Offerings of light hogs on the local market fell off and an eighth-cent raise is noted on 150 to 225 pounders as a result. Hogs under 150 pounds are not desired and last week's price remains unchanged. Packers who are killing for immediate consumption are not paying the raised prices, but are on the contrary shaving last week's quotations from ¼ to ⅜ cents. Receipts are always short during the holidays and buyers are uncertain whether the present light offerings will continue after the first of the year or not. If they do prices will be marked up, but if they start heavy again, prices may suffer somewhat. In view of the price of grain and the prospects for a decided improvement in the February and March market farmers should be able to realize a nice profit by holding the light weights in the home feed lots for the present.

WOOL.

Prices remain the same as last week with plenty being offered by city holders, but none being bought. Wire reports from Boston say, "Look for good activity after January 1, particularly in good, clear wool."

with no particular demand for shipment such stock is hard to dispose of.

Water White, comb	13@16 c
Amber	7@12 c
Water White, extracted	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

The Almond Exchange closes the year with its stock fairly well sold out, and a demand rather better than was expected at this season. Offerings in other quarters also are of no greater importance, and everything should be easily cleaned up in the spring. California walnuts are closely cleaned up, and importers report heavy sales of Manchurian nuts, some of which are of attractive quality.

(Prices f. o. b. San Francisco.)

WOOL.

Buyers still take little interest, and there has been practically no movement in the country of late. Reports from Oregon estimate the quantity remaining in that State at not over 500,000 lbs., which is firmly held for higher figures than have yet been offered. Advances are reported in most foreign markets.

(Prices paid in the country.)

HORSES.

The local market presents practically nothing of interest this week, continued offerings of used stock by drayage firms retiring, etc, giving rather a depressed air to the market. There is a demand here, however, for attractive delivery horses, as well as for heavier stock of the more popular types, and a good many country buyers are coming in.

(Approximate values at San Francisco; based on auction sales.)

Drafters, 1700 lbs. and up	$200@225
Drafters, 1550 to 1650	150@200

The Panama-California International Exposition filed articles of incorporation Dec. 22.

Publishers' Department

Two hundred and sixty-four new subscribers were added to our list the past week, which rounded out the year in good shape. For 1916 we expect better gains in our subscription list than we made in 1915.

Some orders are already coming in for our new book "Second Thousand Answered Questions in California Agriculture." The first volume of this work met with a large sale and the second volume should also, as all of the questions and replies are entirely different. The new book will be ready for distribution next week. Price $1.50 postpaid, with a special offer to our subscribers.

"Ornamental and Fruit Trees" is the title of a new semi-centennial edition descriptive catalogue by the California Nursery Company, of Niles. The book contains over 100 pages, handsomely illustrated, and is largely devoted to description of ornamental plants. It is worthy of a place on your shelves and can be had for 25c per copy.

The Fancher Creek Nurseries of Fresno have just issued their new price catalogue for 1915-16, which they will send upon request. The book is well illustrated, gives description and prices of fruit trees, ornamentals and flowers. Send for it.

Have you a copy of "California Garden-Flowers" handy to refer to in your garden work? This book by Prof. E. J. Wickson is the standard, and will be sent postpaid for $1.50 per copy.

AGRICULTURAL REVIEW.

(Continued from page 11.)

The Farmers' Union Co-operative Assn. of Fallon, Nev., is to put up a 50x100 corrugated iron warehouse to store their wholesale purchases.

A reduction in freight rates on paddy has been asked by the Pacific Rice Growers' Association; and it is hoped that in the future it will take the same rate as other grains.

It is claimed that 100,000 sacks of rice are stored in the four Gridley warehouses, which is the largest crop ever harvested in that section, its valuation being placed at $250,000.

Half a dozen vessels between American and Oriental ports are to be put into operation by the newly incorporated Pacific and Eastern Steamship Co.

The U. S. Senate passed the bill to transfer the U. S. government exhibits from San Francisco to San Diego. It has been reported favorably in the House.

The Petaluma Grange elected A. F. Barber, master; J. J. Bergstedt, overseer; Mrs. D. M. Winans, steward; Mrs. C. D. Grover, chaplain; J. C. Smith, treasurer; Mrs. J. G. Smith, secretary.

The Chino ranch of San Bernardino county is reported to include 13,625 acres alfalfa, 5,055 barley for hay, 4920 sugar beets, 4635 barley for grain, 210 tomatoes.

IDEAL TRACTOR

Wins Plowing Contest Against Two Five-Horse Teams

IN AN actual demonstration at Linwood, Cal., an Ideal Tractor plowed a 32-acre field in competition with 2 five-horse teams, and easily demonstrated the superiority of the tractor. Not only was the work done faster, but in much better shape. The test was made by the Webb Brothers in plowing 64 acres of unbroken soil.

THE IDEAL TRACTOR IS MADE IN THE WEST FOR WESTERN RANCHERS.

THIS product of the Union Tool Co. is built for long, hard service. The material is the best for the purpose and the design ideal for California ranches.

47 inches high—11½ feet long—1200 lbs., or 10 horsepower on draw-bar.

Lays its own track—works any place and immediate deliveries.

Tractor now on Display in our Salesrooms.

MAIL THIS COUPON TODAY.

Productive Feeding OF Farm Animals

FIRST EDITION—1915.

Professor of Animal Nutrition, University of California.

FIRST EDITION—1915

360 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

Redwood Tanks

Stock Tanks and Silos. Lumber direct from the forest. A tank 4x3 ft., $6.50; 5x3 ft., $7.50; 6x5 ft., $9.00; 8x3 ft., $12.75. All other sizes in stock and equally cheap. I sell direct to the consumer Trays, Box Shook. You will save not less than 10 per cent by trading with me. Doors, Windows, Mouldings. 35 years in this business.

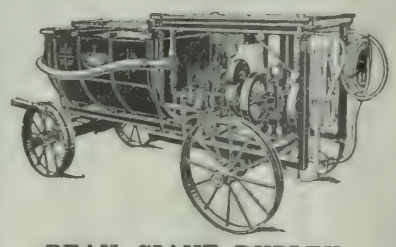
R. F. WILSON, STOCKTON, CAL.

REMCO
REDWOOD TANKS

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

REMCO
Redwood Pipe



All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

California Garden Flowers

Trees, Shrubs and Vines

By E. J. Wickson. A. M.

The newest, most comprehensive book on California gardening. You need this book every day in your garden work. Every part of growing flowers is given attention and you will be richer and happier by having a copy at your elbow when you need it.

C. H. Shinn of Fresno county, in writing of "California Garden Flowers," says: "But Professor Wickson, toiling slowly, methodically, for a lifetime, has given us in "California Fruits," "California Vegetables," and other books to which list the present volume belongs, as safe, complete trustworthy a review of the entire field as is possible now and here. His name is written across our horticulture, and it is no small literary achievement for him to have done this with his many years of work at the university and as editor of the Pacific Rural Press."

The San Francisco Bulletin says: "'California Garden Flowers' is the best book of its kind ever published. Prof. Wickson's book concerns flower-growing in this particular state, while the great majority of books are general in their scope and the information they contain is of little benefit to local readers. It is a thoroughly practical book for California gardeners, in which every phase of the subject is discussed in detail."

If you are particularly interested in bulb plants, or roses or lawns, soils, fertilizers, or if you have bacterial or insect troubles, "California Garden Flowers" will assist you. The book contains nearly 300 pages of closely printed text, besides numerous illustrations, is handsomely bound in cloth and will be sent postpaid for $1.50 per copy.

Picking Oranges for Profit.

G. Harold Powell has been quoted as saying that citrus growers of California lost $50,000 a week for a period last spring due to decay of the fruit. Blue or green mold cannot affect uninjured fruit.

[Written for Pacific Rural Press.]

IN THE chain of events which results in the display of molded citrus fruits for sale on Erie Pier in New York City and the other eastern markets, the first and one of the most important is the picking.

Blue mold, which is the most universal of several rots on account of which a double reduction in price is exacted by eastern buyers, is absolutely powerless on an orange with unbroken skin.

Blue mold spores are so pervasive of citrus districts, especially the packing houses and the washing machines, that a fruit with a scratched skin stands small show of escape.

Fruits at the auction markets are stacked in "lots" on the floor, containing all of one kind, size, etc., from one shipper in a pile. The top boxes of the pile are uncovered to expose the fruit to inspection previous to the daily auction. If two fruits on the exposed layer are affected with blue mold, the number of layers will be multiplied by two to figure on the spoiled fruits. This figure is then doubled to figure on the probable loss in sorting, repacking, etc.

These beautiful oranges are practically immune from decay, but a scratch on the skin in picking, hauling, or packing invites the universal blue mold.

It behooves the grower, then, to avoid all this loss by insisting on careful handling all the way through. Many of the California Fruit Growers' Exchange locals hire gangs of pickers for all orchards under their control, and all fruit shipped from their packing houses must have been picked by their own men, not by the individual growers nor by their men.

The pickers themselves are selected first for trustworthiness, and a foreman is placed in charge of each gang to prevent careless handling. If the foreman has nothing else to do, he can keep a pretty good record for soundness of fruit picked by his gang. Where there are several pickers, the foreman ought not to pick at all. In either case it is a good preventive of careless work to insist on each lug box being marked as having been picked by certain ones. Then blame can be located.

It has been found inadvisable to hire pickers by the box in many associations where this has been tried. The "picker's per box" idea is clearer in the picker's mind than the "grower's per box." Hurry generates carelessness, which generates blue mold, which generates red ink.

But a conscientious man will be awful slow picking unless he has proper tools.

A careful man may injure oranges if he must clip them with scissors. The best clippers we have seen were in use in two orchards near Pomona and Upland. They are described elsewhere. Without special effort, such clippers could not injure the fruit, especially oranges. The curved, blunt-cornered scissors we saw in one Sacramento county orchard would scratch an orange if drawn quickly along its surface. The Oriental labor was pulling and clip-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., January 4, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	2.16	14.15	17.76	54	30
Red Bluff	2.52	11.92	10.56	46	30
Sacramento	3.10	8.28	7.48	54	28
San Francisco	4.46	11.84	8.80	58	36
San Jose	3.32	7.94	6.56	60	22
Fresno	1.46	4.51	3.81	64	24
Independence	2.40	2.73	3.77	44	—
San Luis Obispo	4.76	8.66	6.48	62	32
Los Angeles	2.40	5.58	5.56	60	38
San Diego	1.08	3.28	3.37	64	42

THE WEEK

We were surely looking through our prophetic eye when we remarked in this place last week that the seasonal rainfall had reached the normal at most places, for the claim was not quite justified by the record. However, the prophetic eye must have been onto its job—proof whereof may be found in the storm-area higher up in this column, drops from which are blotting this writing, dry and conventional as its nature is. Whether this wide, forceful and old-fashioned storm comes to us through the reminiscent prescription of Grandfather Rhinehart, the "Oregon weather prophet," or is drawn down by the planetary poultices of Father Ricard of Santa Clara, who says it is due to "a triangular flirtation of Venus, Uranus and Mercury," matters very little—but of course the naughty words we quote are those of a Santa Clara reporter, and not of the cleric. Whencesoever it comes, the storm is here, copiously and continuously wet, and though more boisterous and destructive in some places than true weather pacifism would prescribe, it must be reflected that we usually have to take our great producing storms that way, and nothing is worse than not to have them. It is fair to presume that all properly-opened soils will take this rain down to bottom moisture and thus insure cropping with such rainfall as is reasonably sure to come. And it will mean much larger aggregate cropping than if delayed two or three weeks, as often happens when the holidays glide through dry skies. Therefore we say that whether this rain comes from our planet alone, or from all the planets in conjunction, care not we, so glad it is that it has come at all.

Freedom for Luther Burbank.

According to detailed announcements in the daily papers, Luther Burbank rises from the trenches in which millionating promoters tried to enclose him, and sues in the courts for money owing him, for the recovery of his name from contract engagements and for freedom. We do not know the details of the falling out in a business way and have no thought of unkindness toward those who made investments from which they hoped to realize great returns. We hope also that matters may be so arranged that such investors may at least come out even, for it harms the horticulture of the State to have even unwise investors gather loss and bitterness. But without invoking even our mildest prophetic powers, we could have told each and every one who entered the gilded undertaking of some years ago, to keep out of it, for the projection was predestined to business trouble for more reasons than are worth telling. In defense of the horticulture of the State, it must be said that the promotion was by those who knew naught of it. It was a creature of dreams, in which nearly every alleged fact was a misapprehension. But of course business enterprises often arise from much tribulation, and by adjusting themselves to facts learned by experience win out successfully. This we hope will be the future of those who put money into the company which has carried Mr. Burbank's name.

As for Mr. Burbank's suit for recovery of his contract money and his name, we can only say that he should never have parted with either of them. He is a good business man. There can be no doubt of that among those who knew the facts of his third of a century's financing of his own operations. He has the true New Englander's view of the worth of a dollar and of the obligations of a debtor, and he was always, even through much suffering and self-denial, sound and dependable in his financial relations. It was only when the millionators applied their torches to his imagination and assured him that he could work endlessly without financial worry, that he dreamed he could be a greater creator without standing also as cashier. Mr. Burbank has been the prey of literary and commercial dreamers for a decade or more—not one, but many of them. He is not over-credulous; in fact, he is very careful, perhaps even exacting—but he has had games put up to him which would deceive the very elect. Before blaming him for falling into a visionary net, one should know how many meshes he has broken through before they could be tightened around him. We hope he may escape unharmed from his present besetments. He is a song-bird of the wild; no cage should envelope him. Give us back the Burbank of a decade or more ago; let him make new plants and offer them to a world of propagators who may desire to use them in their work. Such things do best when all who wish can buy the rights to them. While Burbank has the management of his own affairs we have confidence in him.

Millions and Millionaires.

Although Burbanking business has not made millionaires up to date, as aforesaid, it is an interesting fact that California has a few—in fact, it is announced from Sacramento that California has 229 millionaires or multi-millionaires, ranking seventh among the States of the Union in this respect. California also has numerous near-millionaires. These figures were reached by counting five per cent as an average rate on investments and $50,000 as an average annual income of $1,000,000. Thus, the figures being taken from the reports of income for Uncle Sam's income tax, presumably, all you have to do to be counted a millionaire is to report an income of fifty thousand, which will only cost you $500, if we remember correctly, and thus you will contribute patriotically to Uncle Sam's preparedness and enroll yourself among the first 230 Californians—except that the law will not permit the officials to divulge your identity. And that seems to interfere with our plan to break into the ranks of millionaires because the realization of its opportunities depends upon publicity. As the law now is, you might patriotically pay $500 income tax if you wish, but you could not get a single day's more time on your grocery bill. Our plans for personal enrichment always seem to turn out some such way. But there are the millionaires for all that, and California has more of them than there are in any other of forty States. Besides California ranks fifth among the States in the number of incomes large enough for taxation. And so the poorest of us may still count himself rich because in good society—financially considered.

Several Kinds of Gold.

It is interesting to note that the yellow stuff which first made California rich still gives the State eminence in its own line. The Director of the Mint reports from Washington that gold valued at $98,891,100 was produced during 1915 in the United States. He announces also that California led in gold production with a value of $23,005,800, or nearly a quarter of all the gold mined in the United States. Colorado was a close second, with $22,191,200; Alaska third, with $16,626,700, and Nevada fourth, with $11,314,700. No other State produced more than $8,000,000. It is pleasant not to lose our leadership in gold, and thus still to realize, in a way, "the days of old; the days of gold; the days of '49." And this is true though we do much more in other yellow stuff than in gold. The orange crop of last year had a delivered value in the East of more than twice the gold produce of the State, and made a cash return to shippers of several millions more than the value of the gold product—and it probably costs as much to produce a million's worth of gold as of oranges. Then we have another rather yellow product that beats gold in value produced, and that is the dairy output, while yellow grain also goes a third beyond the gold mark. And so, with old things and new, we are still taking much that is golden from the soil—with the golden poppy waving over all of it.

The State as a Product Distributor.

Col. Weinstock, the State Market Director, is due to return from the East this week, and will probably soon make public a forecast of what he expects to do in the development of his work, as suggested by his examination into the sale of California products at the East. Press telegrams from Washington indicate that he may offer producers the chance to distribute their perishable products through the State agency which he will organize, if they so desire. It will be remembered that the law places the initiative with the producer, and naturally the market director can command nothing except as it is entrusted to him by the owner. It seems from the dispatches that Col. Weinstock does not shrink from distribution of whatever is thus entrusted to him by or-

ganized producers who have their handling systems properly developed. One dispatch says this:

"One of the weak spots in the Eastern marketing of California perishable farm products," said Weinstock, "is that some of the shippers are large individual growers, some are growers' co-operative societies, and some are shipping corporations, with the result that the distribution has been conflicting, uncontrollable and unscientific, causing frequent gluts and famines. The plan is to have the growers and shippers voluntarily consign their products for Eastern shipments to the Market Commission, which, under the marketing law of California, they may do. The Market Commission would then create a bureau of distribution, which would utilize its machinery, and the fullest daily telegraphic marketing information which would be at its command, to route and, wherever necessary, to divert shipments in such a manner as to give every market the fullest quota of supplies, and yet avoid needless gluts. Under such a system of distribution, directed and managed by the State, the present and future possible losses, through poor distribution, would be greatly minimized. The consumer would profit by being supplied steadily in place of being made a creature of these feasts and famines. Direction of shipments under the plan would be under the State Market Commission, which through a bureau of distribution would keep itself fully informed by telegraph as to prices and elements concerned in advantageous marketing."

Would It Be Restriction of Trade?

That is a question which cannot be determined in advance, for courts do not project their decisions; they wait until some one has done something and then they may damn or bless him. For this reason the telegraph says that, under the law, Attorney-General Gregory cannot express an opinion as to the legality of the scheme of distribution proposed by Col. Weinstock in advance of its inauguration, but it is understood "that such a monopoly formed by a State Government would be looked upon as having a status under the Sherman anti-trust law materially different from that of a similar enterprise privately promoted." It will probably be one of Col. Weinstock's early undertakings after his return to ascertain the attitude which existing shipping enterprises, private and co-operative, may assume toward his proposition. And of that more will come later.

Sulphuric Acid for Alkali.

It would be a good thing to make a market for the sulphuric acid, which is a by-product of copper smelting in this State, and the disposition of which has long been a problem. It would also be a very good thing to take the edge off the alkaline salts, which are too abundant in large areas of our interior-valley regions. If we remember, it was proposed long ago to treat the soil with dilute sulphuric acid, to neutralize the alkali as a cheaper and more energetic agent toward that end than gypsum or sulphate of lime. It is interesting to know that this recourse is now perhaps coming forth from a line of carefully planned experiments by Dr. C. B. Lipman and the other soil experts of the University experiment station, and their work seems to promise not only the transformation of black alkali into white, but also the disintegration of refractory masses of alkaline soil into more loamy character. The following is said to be a sketch of what happens:

The action of the sulphuric acid is threefold; it entirely neutralizes sodium carbonate, the corrosive "black alkali" salt; it shrinks the jelly-like, easily-swelled materials in the soil, known as "colloids," which are put into a very badly diffused and swollen condition by the washing out of the salt by the winter rains or by irrigation; it sets free some chlorine from the common salt, therefore changing all alkali that does remain into sodium sulphate. Not only sodium sulphate, but also calcium sulphate, magnesium sulphate, and other metallic sulphates are formed, and these have been found to have the power to prevent the poisonous action of the sodium sulphate and of other salts. Therefore, through changing the corrosive "black alkali" salt into sodium sulphates, driving off chlorine from the common salt, and making that into sodium sulphate, by shrinking the "colloids" and by producing calcium and magnesium sulphates, the soil can be changed into one containing only sulphates, and by the shrinkage of the colloids can be made much more pervious to air, and therefore a more favorable place for the necessary bacteria and fungi to live in, and to produce conditions and substances favoring the root action of higher plants.

These conclusions seem to be justified, not only by results with pot experiments in the greenhouse in Berkeley, but by field experiments in small plots at Kearney Park, near Fresno. The field experiments, used to confirm the pot experiments, are even more striking in their results than the laboratory work.

Queries and Replies.

Querists must give name and address.

Alfalfa or Sheep on Morning Glory.

To the Editor: I have been told that morning glory can be smothered out in an orchard by means of alfalfa. Also that if sheep are grazed on it it will be destroyed beyond all possibility of renewal.—Reader, San Francisco.

Alfalfa will put up a good fight on morning glory in a field where it can get all around and over it, but in the open cultivated strip in which the trees should stand, the morning glory will defy both the alfalfa and the cultivator. Ordinary pasturage by sheep will make the field look, for a time, clean of morning glory, but will not eradicate it. If sheep are corraled sufficiently long on a small area they will reduce it somewhat and hogs will do it better because they will root after the roots, but neither will kill out the plant. Morning glory is not so "easy" as that.

Almond Rust and Fall Pruning.

To the Editor: Did you not make a mistake in saying on page 3 of your last issue that you did not know what is meant by almond "rust" and on page 6 giving a description of the work of apricot "rust," which the writer says also affects the almond?—E. R., Oakland.

Why yes, we did: things do happen that way occasionally even in the best regulated families. The "rust" described on page 6 is what we generally call "prune rust," because that tree is most apt to catch it—especially in nurseries where the young trees are kept growing late in the season. This rust, which belongs to the same genus as the rust of grain. is not very frequent on bearing prune trees and usually occurs so late that its work on the dying leaves is generally held to be negligible. It is even less aggressive on apricots and almonds and is not counted much of a pest. Prof. Barrett, whose observations in Southern California are noted on page 6 of our last issue, thinks he has reason to credit the rust with much injury to new fall growth of apricots, etc., forced out by pruning in the summer or early autumn. This perhaps refers to trees kept active very late by irrigation. It does not apply to the great areas of these fruits in central and northern California, where "fall pruning" is not done until the tree has advanced so far in dormancy that new growth does not follow. When pruning is done early enough to force new growth, it is called summer pruning, which is often done with the apricot and does not incur rust in places where most apricots are grown. We referred to the red spider in connection with the question about rust because many associate this mite with a rustiness of the foliage and because the red spider does the almond a million times more injury than any rust fungus.

Nasturtiums as a Weed.

To the Editor: What danger, if any, is there of nasturtiums spreading. They seem to grow so freely that I rather fear their spreading too much and thus becoming a pest. Are they easily gotten rid of?—D. S., San Francisco.

Nasturtiums seed very freely and volunteer most joyously wherever the seed reaches, but their roots are shallow and not running. The seedlings can be pulled or hoed out, or even raked out of a light loam, so easily that we should count them a very mild pest even when they appear where they are not wanted. They may be a little troublesome perhaps, but not bad.

Digging out Borers.

To the Editor: Is now a good time to dig borers? If so, why? If not, why? When does the borer make his cocoon? Is it of value to whitewash the base and trunk of the trees after the borers are dug out? Would you just whitewash or would you put something else with it?—L. R., San Jose.

You do not say what kind of borers you are after—that is, the common flat-headed borer, which works chiefly in sunburn, or the crown borer, which does not wait for sunburn. However, with both, the digging should begin in the fall and continue during the winter, if necessary to closely examine and treat all trees. The more you can do of it in the fall the less injury the borers have a chance to do, because they die younger and in the case of young trees with the flat-headed borer, they may be stopped before the little stem is girdled and destroyed. In the case of the crown-borer it is also desirable to kill them young, for they continue growing and boring all through the fall and winter unless checked in their ruinous career. Therefore one should begin looking in the fall for the discolored spots on the young bark of newly planted trees which show that the borer is at work—and looking also for the exudation of gum and saw-dust which indicate the opening of the burrow of the crown-borer. It is toward spring when the worms of both borers stop eating and go into the pupa state or cocoon. For the flat-headed borer, after the larvae is reached by blade or crooked wire, the wound should be covered with whitewash or Bordeaux paste. For the crown borer after digging out, a band six inches wide of "asphaltum D" should be placed in the spring on the rough bark around the base of bearing trees, a little above and below the ground line. This will keep in the perfect insects which come from the cocoons which are at the openings of the burrows and it will keep out the newly hatching larvae from eggs which will be then laid on the tree near the ground by the insects which are not shut in by the asphaltum.

BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

Also Book Containing Valuable Garden and Field Information.

One of the largest seed houses in the West, the Aggeler & Musser Seed Co., of Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1916 catalogue from the printer, and are beginning the distribution of the same. This is their 23rd annual catalogue and it surpasses all previous editions. It is said to be one of the most complete seed books published and contains answers to more than 1000 questions. It gives information regarding every kind and variety of plant grown in the Southwest, and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use in order to obtain the best results. Valuable hints on poultry, spraying and use of insecticides are also given.

In addition the distributors have issued a hand booklet entitled "The Garden Manual." It gives good, practical answers to questions which gardeners and ranchers have asked from time to time.

The Aggeler & Musser Seed Co. will gladly send their catalogue free and postpaid to anyone writing and requesting it.

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a through test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevadas, assuring a fibrous root system second to none in California.

Write for catalogue and full list of trees.

Rice, 90 Sacks Per Acre.

[Written for Pacific Rural Press.]

Rice grown on sediment soil 5 or 6 inches deep overlying adobe, yielded 900 sacks on 10 acres, and matured so early that it took the silver cup at the Gridley Exposition 1914, for earliest and best Wateribune.

Sediment lying on an impervious stratum has several advantages. It works up into a fine seed bed early in the season. This 10 acres belongs to M. D. Woodruff of Butte county. The soil was so warm that it was planted without irrigation Mar. 21, the first in that district. Early planting is a necessity because of the long growing season required and the need of a dry harvest. One section this season has only 50 per cent of a crop because they couldn't get the water necessary at planting, until May 15 to 20.

The sediment, instead of baking and cracking as most rice land does after being planted, retained its moisture so well that the seed germinated fine and was 5 inches tall before it required water. The strong root system started in this period was a great factor in the yield, thinks Mr. Woodruff.

This 10 acres had been fall plowed, replowed in spring, harrowed, and 90 pounds of clean seed drilled 2 inches deep with a Van Brunt drill and spike-toothed immediately after drilled, to hold moisture. It came up in about 8 days, and was harrowed lightly then, against all advice. It did look rough, but it took the prize, later. It was flooded Apr. 17, nearly a month after planting. This was simply to keep the surface moist and was at once drained off. When it dried a little the whole field was irrigated; and part of it received another irrigation. The aim was to just keep the land in good moist growing condition. All was submerged June 5 enough to cover the ground and water was kept on the rest of the season. Inflow was regulated to compensate seepage and evaporation, except in mid-August and in September, when cold spells necessitated increased depth of water for protection of plants. When the rice was 12 to 15 inches tall, before it began to head, the watergrass was pulled.

About Oct. 5 the water was drained off, requiring about 10 days to dry enough for the binder. With firm ground, the Deering binder pulled by four horses would have averaged 7 acres per day. The grain and straw were so heavy that it took 3 men to keep up with the binder, shocking the bundles. After a few rounds a rain came which stopped harvesting for a week and required 5 horses when work started again. About ¾ inch of rain fell on the shocks before threshing.

The straw and grain were a bit green and moist when threshed Nov. 8; so that when piled solid in the warehouse 22 sacks high, it heated a little and was some damaged. Some grains from which the husk had been broken in threshing showed a slight tinge of greenish mold. This spoilage could have been avoided by delaying threshing for a few days or by "criss-crossing" the grain in warehouse. "Criss-crossing" means that the sacks are stacked on edge and with alternating layers facing a quarter way around. This leaves air space between the sacks for ventilation, but costs more for storage. The greenest of this lot was criss-crossed and came through all right.

If the shocks, each of which contained 8 or 10 bundles, had been capped, the grain would not have become so wet. But the main object of capping, according to Mr. Woodruff, is to prevent "sun-cracking." This is a defect which does not affect the husk, but causes the grains to break in the milling. It also occurs on those rare occasions when the crop is left standing too long after it ripens, as happened to one man in that district one season.

Mr. Woodruff had never raised rice before; but had studied the reasons for various improved farming practices and was so enabled to apply his knowledge to new conditions.

CHERRY VARIETIES.

Only very early cherries in early districts are very profitable to plant for shipping, because plums and apricots soom compete for the consumers' appetite. Later varieties of cherries are good for canning. Among early districts, Vaca valley and the Sacramento river compete for the honors of shipping the first cherries. Sometimes one beats the others by questionable practices such as ringing the limbs, but in straight commercial growing the earliest varieties to ripen naturally are the best for shipping. Among these are the Burbank, Purple Guigne, Black Tartarian, Rockport, and Chapman, according to H. A. Bassford of Vaca valley. Royal Annes are the standard for canning because they are firm after processing and do not color the syrup. The dark colored ones are more satisfactory for shipping because pressure in shipping boxes does not discolor them so noticeably as it does the light-colored varieties.

Bacteria for Available Potash.

[By Prof. C. B. Lipman, Berkeley.]

One of the most striking facts brought out by our investigations in soil bacteriology is the relation of soil bacteria to the production of carbonic acid gas in the soil. Several investigators have definitely proved that when soil is sterilized, carbonic acid gas is not produced there, which simply means that we are dependent for that material there entirely upon the living organisms. Since, also, it has even been claimed that fertility in soils is a function of the carbonic acid gas content, we can readily conceive the importance to soil fertility of the soil bacteria from that standpoint alone.

This carbonic acid gas is produced through activities of the soil bacteria in breaking down organic matter and oxidizing the carbon thereof and through their own respiration processes. It is produced in enormous quantities. Its importance in the soil lies not only in acting with water as the source of energy for certain of the auto-trophic soil bacteria, which produce organic matter from inorganic substances only, but also as the most important solvent of the soil minerals which we have. Carbon dioxide in such large quantities dissolved in the soil water makes a weak acid which undoubtedly carries out some of the most profound changes in the solution of potash or phosphoric acid otherwise insoluble in the soil. From the standpoint merely of production of carbon dioxide, soil bacteria are of the greatest practical importance and we can enhance their activities in this direction also and have a practical control of them there, by supplying not only the proper air, moisture, and temperature conditions above indicated, but more particularly by supplying a large quantity of organic matter and an adequate quantity of lime, since the latter enhances the rapid decay of all organic materials in the soil.

MARKETING BRANDED POTATOES.

[Written for Pacific Rural Press.]

What seems to be a winning venture at marketing fancy potatoes in Potatoland is the system worked by the Boa Vista ranch of Eldorado county in Sacramento. They grew 35 acres of potatoes last year. The mountain potatoes have better quality than those grown on the River; and it is the aim of Chas. Schaeppi and E. H. Phreaner of this mountain ranch to get 2000 customers in Sacramento who demand their brand consistently through the year and will pay extra for the better potatoes. The idea is to supply a steady market the year around rather than to hold for speculative prices.

Wholesalers in San Francisco are treating them all right, Mr. Phreaner says, but retailers everywhere, even in his home town, put the kibosh on Boa Vista potatoes when demanded by consumers, by substituting other kinds, often without informing the customer, sometimes saying that cheaper potatoes are as good.

Since the only value of a brand is to establish a reputation and demand, the substitution of inferior potatoes makes the added cost of growing, grading, and branding a total loss.

Being unable to control the use of their brand in retailers' hands, two young men have been stationed in Sacramento whose business it is to solicit orders and see that customers are satisfied. When the supply bought for any household is due to run out and a repeat order is not forthcoming, a letter is sent asking why. If the letter is not answered, a personal visit shows if there has been anything wrong. If so, they make it right.

Quality is guaranteed and obtained, first by close study of cultural details, growing big crops at big cost as noted in a recent issue, giving plenty of water and fertilizer; planting thick so the tops shade the ground to prevent black streaks inside which are thought to be due to overhot soil.

The crop when harvested is graded by machine into seven uniform sizes, passing two inspectors as each potato runs along a belt several feet long into the machine. They are culled rigidly and packed into branded sacks which are at once weighed, filling to 104 pounds gross, selling for 100 pounds. A pasteboard label showing size, variety, grade, name and location of the ranch is laid on top and the sack sewed ready to truck down to the railroad.

UNIVERSITY WILL DETERMINE YOUR SOIL ACIDITY.

The question, "When do soils need lime?" and the answer by Dr. Lipman in yours of the 20th of Nov. is very satisfactory as far as it goes, but with your permission I would be much obliged by an answer to a particular case which may apply to many.

I have an orchard, 30 years old, which on an average bears a crop of four tons of Bartlett pears, of good quality, to the acre without irrigation. For three years a cover crop of burr clover has been plowed under in spring and two years ago 16 tons of stable manure per acre was applied. The soil is rather heavy and shows a slight acid condition. It is a sediment from mining debris of the red soil of the country mixed with a light colored decayed porphyry and is about 5 feet deep to a bed rock of grano-diorite.

Now I have a bulletin of the U. S. Department of Agriculture No. 77 which says on page 11 that the pear is liable to be injured by liming **under certain conditions** which it does not specify. Would you kindly supply the omission by stating the conditions referred to?—J. P. D., Placerville.

[Answered by Prof. C. B. Lipman, Berkeley.]

So far as I know, the evidence as to possible harmful effects of lime on pears is meager, if at all worth considering. I am unable to say what the words "under certain conditions" used by the author referred to actually mean. If Mr. Dunlop really has an acid condition in his soil, he can safely go ahead with the application of lime this fall without any fear of bad consequences. He speaks, however, of the fact that his soil "shows a slight acid condition." I should advise him to be certain that his soil has an acid condition before he applies the lime. If he desires, we shall be glad to make a test for him if he will send us samples collected in accordance with the directions given in a circular, which will be sent to anyone interested.

Dr. E. J. Allen is planting 40 acres of his farm near Applegate to pears. He already has 40 acres of older pear trees on the place.

Our Great Phosphate Reserve

A grave problem for the farmer is to discover the needs of his depleted or unfavorably proportioned soil. Its greatest need may be phosphoric acid, one of the three substances that are most necessary in maintaining fertility, the other two being nitrogen and potash. Phosphoric acid for use in fertilizers has been supplied for many years in part by the phosphates of Florida and Tennessee and from islands in the Pacific ocean. These deposits can not always supply the demand, and therefore the recent discovery that the Rocky mountains contain the largest known area of phosphate rock in the world is of vital interest to future generations, if not to the present one.

Albert Richter claims to be the original discoverer of the western phosphate deposits, because he recognized rock phosphate in Cache county, Utah, in 1889, and located claims on it. These phosphate deposits are said to have been independently discovered in 1897 by R. A. Bidock in Rich county, Utah, in old diggings in black rock that he mistook for gold prospects. A large sample analyzed in 1899, however, proved to be high-grade phosphate rock. In 1908, on recommendation of the Geological Survey, the Secretary of the Interior withdrew from entry 4,500,000 acres of land in Idaho, Utah and Wyoming, believed to be valuable for phosphate, and this phosphate withdrawal was continued by the President under the act of June 25, 1910. In 1909 and succeeding years these phosphate deposits were systematically examined by the United States Geological Survey, and in 1910 phosphate rock was discovered in Montana, near Melrose, by Geologist H. S. Gale. On January 1, 1915, the total area of phosphate lands in Montana, Utah, and Wyoming withdrawn from entry was 2,713,155 acres. This phosphate reserve is larger than any similar area in the United States. It is, indeed, the largest area of phosphate rock yet recognized in the world.—United States Geological Survey.

CHEAP AGRICULTURAL LIME.

Waste lime from beet sugar factories has been pointed out as cheap and efficient for soil improvement by P. L. Hibbard of the University of California.

"Sugar factories," says Mr. Hibbard, "use large quantities of lime in purifying beet juice. During the process the quicklime is changed back to carbonate, the same chemically as it was in the original limestone. But its appearance is very different. The waste lime is discharged from the factory as a sort of mud. This lime is, by weight, nearly half water and contains impurities from the beet juice which were originally derived from the soil. Some of these are valuable as plant foods. A ton of the waste lime may sometimes contain as much as a dollar's worth of these plant foods, in addition to the lime, which is its chief value. On account of the large amount of water in it, the waste lime will contain only half to two-thirds as much pure lime as a good limestone, or one-fourth to one-third as much quicklime. But it is very finely divided, hence it mixes easily with the soil and acts more quickly than ground limestone, which is relatively much coarser.

"Though it has some plant food value this material is useful chiefly as a corrective for acid soils and for making heavy soils work easier. It must be distinctly understood that not all soils are improved by lime. Persons interested may obtain from the Experiment Station at Berkeley, Circular 111 on The Use of Lime and Gypsum on California Soils.

"The chief expense for this waste lime will probably be for freight and hauling. After it has dried enough to crumble easily and spread well, it should be one of the best forms in which to apply lime to a soil needing such amendment."

HAY BEFORE BEAN CROPS.

[Written for Pacific Rural Press.]

By planting oats on 10 acres in December, 1914, S. C. Peck of Stanislaus county was able to get a good crop of grain hay and a crop of blackeye beans from the same land in 1915, the latter going about 15 sacks to the acre.

The hay was cut about the first week in June. After hay harvesting the land was irrigated by flooding and after plowing again, planted to beans June 25 to July 15.

Mr. Peck never cultivates beans with a cultivator after planting, but keeps a mulch on the surface with a weed cutter which he uses enough to keep the weeds down between the rows. Enough hoeing is done in the row to keep the larger weeds down there. He harvested his beans last year the latter part of September and the first part of October.

Altogether Mr. Peck raised 85 acres of beans in 1915, the other 75 acres having been planted in May and harvested about the same time that those on the hay land were. Part of his ranch is sub-irrigated and from his experience he thinks that while there is a heavier growth of vines on that kind of land than on his other, there is no material difference in the yield of beans.

On the sandy soil which is characteristic of his section, Mr. Peck gets a better yield on land that has formerly been in alfalfa, also on land which has been planted to beans for several years previously.

Seventy tons of headed milo maize was picked from 30 acres on the Ana Mac Ranch two miles southeast of Delano. A grain crop was first taken from the land. It cost $7.75 to raise and pick an acre of corn. The itemized figures are as follows: plowing, $1.50; cultivating, 75c; irrigating three times, $3; picking, $2.50. The cultivating was done after the first irrigation. Next season the corn will be harrowed after the first irrigation and cultivated after the second.

California Garden Flowers

Trees, Shrubs and Vines

By E. J. Wickson. A. M.

The newest, most comprehensive book on California gardening. You need this book every day in your garden work. Every part of growing flowers is given attention and you will be richer and happier by having a copy at your elbow when you need it.

C. H. Shinn of Fresno county, in writing of "California Garden Flowers," says: "But Professor Wickson, toiling slowly, methodically, for a lifetime, has given us in "California Fruits," "California Vegetables," and other books to which list the present volume belongs, as safe, complete trustworthy a review of the entire field as is possible now and here. His name is written across our horticulture, and it is no small literary achievement for him to have done this with his many years of work at the university and as editor of the Pacific Rural Press."

The San Francisco Bulletin says: "'California Garden Flowers' is the best book of its kind ever published. Prof. Wickson's book concerns flower-growing in this particular state, while the great majority of books are general in their scope and the information they contain is of little benefit to local readers. It is a thoroughly practical book for California gardeners, in which every phase of the subject is discussed in detail."

If you are particularly interested in bulb plants, or roses or lawns, soils, fertilizers, or if you have bacterial or insect troubles, "California Garden Flowers" will assist you. The book contains nearly 300 pages of closely printed text, besides numerous illustrations, is handsomely bound in cloth and will be sent postpaid for $1.50 per copy.

Address

Pacific Rural Press
525 Market St., San Francisco

Foothill Plum Varieties Described.

Clymans—Probably not advisable to plant.

Tragedy—Good seller, but does not bear well in all locations.

Santa Rosa—A good plum in most respects. Trees require careful and proper pruning and crop requires thinning.

Climax—A standard Japanese variety but liable to crack, especially if moisture supply is not evenly maintained. A heavy bearer and the crop should be thinned.

Vacaville—A new plum resembling the Tragedy. Will probably be a good seller, but not yet sufficiently tried out. Promising.

Formosa—Fine size, but very fragile, delicate skin and easily bruised; hardy and bloom not easily frosted.

Maynard—A fine plum, but not a good bearer.

Burbank—Fair seller, sure, heavy yielder, carries well.

Diamond—A profitable variety at present. Does not live long enough on peach stock in all soils. Better chance of success if grafted in branches. Myrobalan roots preferable.

Wickson—Valuable on account of large size and good shipper. Will bear regularly if not allowed to overbear.

Purple Duane—This variety should be tried out. Quite promising.

Grand Duke—The peer of shipping plums. Can be dried and sold for large size dried prunes. Very popular plum in Eastern market if landed ahead of Idaho Italian plums. Good in early sections of the county.

Giant—A good seller if properly grown and thinned. Liable to overbear. Pale pink color is not favored, but if good size will bring fair price.

Gros and Hungarian—Magnificent plums, but shy bearers in some sections.

German Prune — Fair bearer and good seller, but not grown to any extent in the county. Deserves a tryout.

Kelsey Japan—Regular bearer in some sections if not allowed to overbear; susceptible to peach-moth damage unless sprayed. Do not plant in frosty situations.

Gaviota—A new variety; not yet tried out. Probably good.—E. O. Amundsen, Placer County Farm Adviser.

PEACH VARIETIES IN PLACER COUNTY.

Alexander or Mayflower — Shy bearer, but may give early money.

Briggs Red May—Fair bearer; early.

Triumph—First reasonably good shipper among early varieties. If thinned will be of good size and attractive to Eastern buyers.

Early Crawford—Staple variety; light bearer when young.

Late Crawford—One of the finest quality; often comes into Eastern markets between heavy supplies. Not always good bearer.

Elberta—Standard variety; good bearer, but comes in with Eastern peaches.

Orange and McDevitt Cling—Standard mid-summer shipping clings and must be handled like eggs in the picking and packing to insure arrival in Eastern markets in sound condition to bring good prices. Extremely high color and of fine appearance.

Lovell—Sometimes profitable for local trade.

Salway—Probably not advisable to plant.

Tuscan—Standard canning variety.

Phillips Cling—Standard canning variety.

Levy Cling—Standard canning variety.

J. H. Hale—Claimed to be an improvement on the Elberta, ripening about the same time.—E. O. Amundsen, Placer County Farm Adviser.

FEDERAL LICENSE FOR WAREHOUSES.

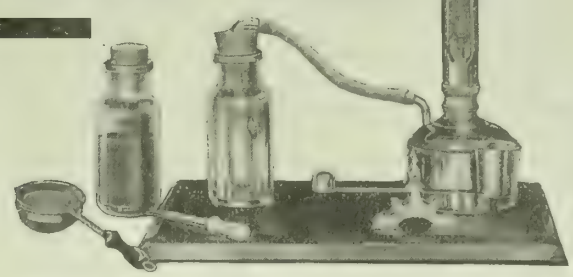
Whereas, Quotations to show general market conditions can only be based upon uniform grades of farm products;

Whereas, Grain, cotton and other farm products should be made the most convertible of assets;

Whereas, The universal negotiability of warehouse receipts depends upon a system of uniform grading and a properly bonded warehouse inspection; Therefore be it resolved:

First: That we commend the work of the Office of Markets, United States Department of Agriculture, in its effort to establish uniform standards and grades for farm products;

Second: That we recommend to Congress the passage of suitable legislation making permissive the establishment of state graders acting under federal license and regulation, and of a system of warehouses which may be licensed and inspected by the federal Office of Markets in order to most effectively insure uniformity in grades and widest negotiability of the warehouse receipt;



Third: That the State legislatures should pass such supplementary legislation as will insure the co-operation of all interests for obtaining uniform warehouse receipts and uniform grades, which statutes shall be sufficiently flexible to be in accord with all such federal action;

Fourth: That all federal inspected warehouses shall be required to register the amount of each graue of each product received and delivered;

Fifth: That in any given federally inspected warehouse no differences of rates be allowed for the same grade of any given farm product because of differences of amounts stored, or from other causes, and that no other form of discrimination shall be permitted. — From resolutions of National Ass'n of State Marketing Officials.

At a recent meeting of the rice committee of the Sacramento Valley Development Association, statements were made by experts on the dangers facing the rice industry in the State on account of wild grass pests. The following committee was appointed to inaugurate movements in their various localities against the spread of this pest: George E. Harvey, Biggs, chairman; Miss May Sexton, Sacramento, secretary; Emory Oliver, Sacramento; N. P. Searles, Woodland; W. H. Heileman, Willows; William Grant, Vacaville; B. F. Walton, Yuba City; W. A. Beard, Marysville, and W. K. Brown, Colusa.

1. Whether a soil is in the right chemical and physical condition.
2. Whether a soil is **slightly, moderately** or **extremely acid.**
3. How much Lime is needed per acre to counteract the acidity
4. What quantity of Carbonates (Lime and Magnesia) a soil contains. It will indicate quantities, both in "percentage" and "in tons per plowed acre." From this you will see whether a soil is lacking in them or has plenty of them.
5. Whether disclosure of Carbonates is Alkali or Lime.
6. Whether a soil is lacking in Humus. It will show you whether a soil contains 1 per cent or more, ½ per cent, or none.
7. Whether a soil is in need of a green manure crop.
8. It will demonstrate the probability as to whether a soil will respond to applications of chemical fertilizers or not.

Walnut Growers' Association.

[Written for Pacific Rural Press by C. Thorpe, Mgr. California Walnut Growers' Ass'n.]

The California Walnut Growers' Association is the marketing organization of the large percentage of the walnut industry in California. The business of the Association is conducted strictly on no-profit, co-operative lines. The Association has no capital stock, operating on the membership principle. The principal walnut districts of Southern California are located in a territory about 175 miles in length and 20 miles in breadth, along the Coast line from Goleta, in Santa Barbara county, to San Juan Capistrano in San Diego county. The districts being so scattered, there have necessarily sprung into existence quite a number of local walnut growers' associations in each of the principal producing walnut sections located in the territory above outlined.

Membership in these local associations costs $3.00 to $5.00 an acre, which is used toward purchasing a site conveniently located on a railroad siding, and building and equipping a walnut packing house. The walnut graders and cleaning equipment in these packing houses are as nearly uniform as possible, the California Walnut Growers' Association having developed certain restrictions on grading methods, etc.

These local associations have the privilege of becoming members of the California Walnut Growers' Ass'n; and when they do so, one of their members is elected as a director of the California Walnut Growers' Association; thus the central association is simply made up and owned by the various local walnut growers' associations.

By purchasing supplies for the sacking and bleaching of the walnuts of its members, the Association saves them many thousands of dollars annually, and through the perfection of its sales department is also enabled to make a very great saving in the selling expense, the volume of business handled having reduced the selling cost to approximately 3 per cent. Through our sales department we have opened up much territory which formerly was controlled entirely by importers of foreign walnuts, and through our insistence on high quality and uniformity in grading methods, we have been able to give the trade an article of dependable quality. Our system of distribution enables us to keep every market of the country in a supply of walnuts during the heavy consuming period, thus insuring the maximum consumption which was formerly impossible when some markets were glutted early while others were kept entirely bare of a reasonably early supply.

EUREKA WALNUTS.

[By Dr. L. D. Batchelor, Citrus Experiment Station, Riverside.]

The Eureka is being extensively propagated, largely to fill the increasing demands of the central California planters. This variety seems well adapted to the lower San Joaquin Valley, although the original tree is located in Fullerton, Orange county. The tree is a very rapid, vigorous grower of an upright habit, and reaches a profitable bearing age considerably later than the Placentia. Judging from the original tree and the oldest groves, the Eureka may be expected to be a medium to heavy producer as the trees mature. The nuts are large, fairly uniform, elongated, and of medium smoothness. The shell is medium to thick and well sealed. The nut will stand any reasonable handling during harvesting and processing without cracking open. The kernel is a light cream color, of medium plumpness and is easily cracked out whole. During some seasons the kernels are inclined to fill poorly through one quarter of the nut. The quality of the Eureka is excellent and should eventually become established as a very popular commercial variety.

The dense, large foliage protects the nuts against sunburn to a large degree, and perforation is seldom or never experienced by this variety. Its lateness in coming into bloom seems to enable it to avoid much of the blight infection the majority of seasons. The harvest follows soon after the Placentia and earlier than the Franquette or Mayette. Taking all points into consideration, the Eureka seems to be one of the most promising varieties for the northern inland sections.

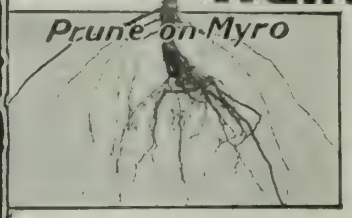
STRAWBERRIES TOO WELL CARED FOR.

[Written for Pacific Rural Press.]

Five double rows of Ettersburg strawberries 80 feet long with plants 24 to 30 inches apart were set by C. R. McBride, formerly of Solano county, from a dozen plants received from Pacific Rural Press the previous winter. When seen, the spring after the long rows were set, they showed large plants with heavy dark green foliage, not heavily set with berries.

The plants had not died down in winter. The runners had been clipped and had grown a foot long again before ripening season. The berries, some of which were ripening, were over one inch in diameter every way, and were held free of the ground, but under the heavy foliage so they did not sunburn. Perhaps this was also the reason that some did not color well. They had a flavor of their own, very attractive, though not liked by some people.

The reason for their light bearing was the good care they received. Between the double rows was a trench a foot wide for irrigation, and the ground had been heavily enriched. The combination of water and plant food was too great a temptation for this variety to make plants rather than fruit.



PEAR BLIGHT FIGHT.

Regarding the article "Pear Blight Fight Paid" in the issue of Dec. 18, E. A. Gammon writes that we were misinformed; that Mr. Reed never expostulated with him for cutting the blight so severely. Mr. Reed himself had told us that he did not do thorough work cutting out blight until the fall of 1914, owing to the rush of work and because he had not realized the full danger. It is well known to our readers that he did a most thorough job then, and that it paid him well.

"Behind each tree is our guarantee"

These Roots Insure You Against Loss In Transplanting — They Insure You A Good Stand— That's What You Want

These are the kind of roots our foothill grown trees have, peculiar only to our foothill location—note how fibrous and well branched—for good roots, freedom from root knot, disease and hardiness, foothill grown trees have no equal.

Now is the Time to Secure Your Requirements While Our Assortment is Still Complete

You know now the varieties you intend to plant. Give us a list of your wants and we will quote you an itemized estimate of their cost giving you the benefit of the special prices and terms we make to the early buyer. We will mail you also our catalogue giving you accurate descriptions and recommendations as to each variety and useful information.

Write us for advice giving us the particulars of your location and the varieties you desire to plant. Our twenty-five years experience as fruit growers, fruit shippers and nurserymen is yours for the asking.

Every Tree We Sell is True to Name and Behind Each Tree is Our Guarantee

All our trees are foothill grown—our buds are selected for propagating from parent trees having the best record for quality of fruit and productiveness.

This Makes Every Tree a Pedigreed Tree

There will again be a shortage of our foothill grown stock so don't wait—write us now—advise us as to your wants—place your order for our foothill grown stock while the assortment is complete—those who wait are usually disappointed.

We Make a Specialty of

PRUNES
French, Imperial, Robe de Sargeant, Sugar and Standard on Myrobolan root; also on Peach root.

CHERRIES
Royal Ann, Black Tartarian, Bing, Early Chapman, Early Burbank and Lambert on Mazzard root; also on Mahaleb.

OLIVES
All varieties grafted on Picholine root; also grown from cuttings.

SHIPPING PLUMS
Beauty, Formosa, Climax, California Blue, Diamond, Wickson, Gaviota, Kelsey, Grand Duke, Hungarian and all other varieties — on Myrobolan, Peach and Almond root.

CLINGSTONE PEACHES
Our Improved Tuscan Cling, Improved Hauss, Phillips of true type; and also other standard varieties.

APRICOTS
Royal, Blenheim, Newcastle Early, and all varieties—on Myrobolan, Apricot and Peach root.

ALMONDS
All standard varieties on Almond and Peach root.

WALNUTS
Franquette and San Jose Mayette, cut by R. Wiltz, the pioneer Walnut expert, from specially selected trees of absolutely true type—the highest pedigree that can be given a Walnut. Write for samples of nuts from parent trees.

Our assortment is complete in all other varieties of fruit trees and vines—write us now concerning your wants.

Bergtholdt's Special Selection for Home Orchard $3.95

This is an opportunity to get 10 fine trees of choicest varieties of fruit delivered freight prepaid for only $3.95. You can make your own selection or leave it to us and we will send you ten best grade 4-6 ft. deciduous fruit trees including one grafted walnut. Write for our list of combination offers for home planting and our free book on California fruits. Address Box A

NEWCASTLE -- CALIFORNIA

Good Culture Increases Orange Sweetness

As a result of the thousands of chemical tests which have been made of oranges in connection with the work of the Tulare County Protective association in determining the 8 to 1 test during the past two years, it can be definitely stated, according to the officials of the organization, that fruit from those orchards which are liberally and properly irrigated, liberally fertilized, properly pruned, and carefully cultivated, show fruit which will meet the government requirements early in the year, particularly if such work has been done for a term of years. On the other hand, neglect of an orchard for even a single year will result in tardy formation of sugar.

In almost all instances, on the other hand, when fruit colors at a very early date, the sugar content is low. It is said that there are a few orchards in this district on which fruit was in full color early in November and this fruit now tests as low as 6 to 1.

CLEAN CUT AT END OF ORANGE TAP ROOT.

[Written for Pacific Rural Press.]

Just before planting, the lower end of orange tap roots ought to be cut off just enough so the bark is tight to the wood all around the cut place, according to E. O. Giddings of Tulare county. Thus it will heal at the cut and send out new roots quickly both from the healing callous, thus getting a good deep root system, and also roots from points above on the tap root. If bark at the lower end of a tap root is left loose at planting the tree is very likely to die, as had one which we had taken from a neighbor's ranch with the root rotted. It is also true that all severed roots of transplanted trees generally should have a clean cut at planting.

ORANGE "BROWN SPOT."

[Written for Pacific Rural Press.]

The recent discovery by Prof. H. S. Fawcett of the citrus experiment station that "brown spot" of oranges could be produced by applying citric acid from other orange peelings, seemed to show that "brown spot" is not a disease. But it had not been found that such spots could be produced by so treating green oranges on the tree, until recently. Deputy State Horticultural Commissioner G. P. Weldon has in his office oranges on which typical "brown spot" was produced by applying citric acid to their rinds while green on the tree. A knife blade wet with the acid was rubbed lightly flatwise across the skin without breaking it in any way, and the spots developed.

PICKING ORANGES FOR PROFIT.

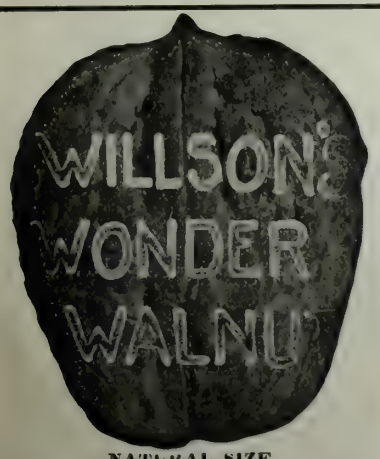
(Continued from page 25.)

ping the fruit in a desperate hurry to get done, and many long stems had to be cut off again. Many such were not cut again, but were tumbled into the lug boxes to scratch all which they touched.

Pulling oranges usually means squeezing them and this is about the same kind of injury to the fruit as was caused in the orchard mentioned above by dropping the oranges into the sacks—bump, thud, bruise, rot, red ink on that orange and some other orange must pay for the packing, hauling, freight, etc., on that one, so there are two on which no profit is made because one was bruised. This is not counting the injury to fruiting wood caused by pulling the oranges off.

Stepladders ought to be provided tall enough for the picker to reach the tops of trees—ladders with three legs only, so that the third leg may be set in among the branches without damage. Some growers prune open spaces from circumference to center to admit light and air for interior fruit. This facilitates picking.

Gloves are needed by all pickers to prevent fingernail injuries; and small mouthed canvas bags hung from the shoulder prevent throwing oranges in, with a thud. In one orchard, the bags were held partly open by crescent-shaped frames whose concave sides fitted against the body. When these are not too large, each orange must be carried to the mouth of the bag. The bottom of the bag may be opened to let the oranges roll gently into lug boxes. Each bag held about half a box. Since scratched skin makes a potential rotten orange or lemon, sticks and hard dirt are better left outside the field boxes. Likewise splinters and nails projecting into the box because of rough handling while empty, are fertile sources of injury.



So again is the policy of filling boxes above the edges and stacking them up in wagons. The squeezing they get here opens them to infection, whereas the squeezing they get in nailing the lid of the packed box still leaves them protected by paper wrappers.

What to Pick—Aside from the 8 to 1 regulations of the California Fruit Growers' Exchange, there are assignments by the local packing house as to size and quality to be picked by any one man any one day. The Exchange advertises two brands, creating demand for them and higher prices. To get repeat orders on these brands strict regulations are enforced as to fruit packed under them.

To get the benefit of the second grade of these brands, the fruit must not be badly sunburned, nor very rough or coarse, must be free from insects and diseases, splits or other decay-producing injuries, must not be badly misshaped or colored, and none may be picked from the ground.

When fruit excluded by the rules from the advertised brands is picked, hauled to the packing house and sorted out, there is all that labor lost; when it isn't sorted out, there is much more lost not only on that shipment but in the reputation which sells many growers' fruit without inspection when common fruit doesn't sell for as much as freight charges.

Plans are being made by a committee of stockholders to separate the Winters and Suisun canneries which are owned by the same company.

Superior Northern Grown
TREES

Oregon grown trees have earned an enviable reputation in California. Many Inspectors have pronounced them the finest trees that come into their district. We have a limited surplus of the following:

PRUNES—
French on Myrobolan.
French on almond.
Imperial on almond.
Imperial on Myro.
Sugar on peach.
Sugar on almond.
APRICOTS—
Royal on Myro.
PEARS—
Bartlett. Anjou.
Clairgeau and other leading varieties.

These are all our No. 1 grade—strong, thrifty trees, good roots, clean and smooth. No cull trees that we are stuffing off at "bargain prices." Let us know your wants, now. Prompt shipment assured.

OREGON NURSERY COMPANY
ORENCO, OREGON.

Alfalfa Plowed in Fall for Vines.

[Written for Pacific Rural Press.]

F. H. Wilson of Tulare county plowed up 18 acres of five-year alfalfa to plant Emperor grapes. He was glad he did it in November, for the alfalfa thrived on the plowed ground. It was plowed seven inches deep, according to W. M. McKersie who was in charge of the vineyards. Then late in February, he finished plowing it again, 10 or 11 inches deep. "It will take all summer to get the alfalfa out," said he.

As soon as the plowing was well worked down, he staked it out 7x12 feet and proceeded with his planting.

"Not one man in ten gets a good stand of grape cuttings, and it is hard to get resets the following year to grow well."

Perhaps that is why he insists on so much care in planting. One man was busy dipping the top ends of 12-inch split redwood sticks in whitewash. These were to be set beside the cuttings to show where they were three weeks later when the vegetation might hide them from view of the cultivators.

Trimming the Cuttings.—Another man was trimming the cuttings. They were 14 inches long and well rooted. All roots were clipped off close except those at the end. Deep-rooted vines were desired—so much that later on the dirt was plowed away close to the vines seven inches deep, the remaining dirt hoed away, and the new roots exposed were clipped off. They grew fast because the surface soil was warmer; but later on it would be dryer and roots in the surface soil would be a liability rather than an asset. Those that remained were cut to three inches.

The pruner also cut off practically all but one shoot from the top end. This one was cut back to one bud.

A hole big enough for both feet at once, and 15 to 16 inches deep was dug for each cutting. It was filled in with top dirt so the cutting would set 12 or 13 inches deep. About four inches of loose dirt, thrown on top of the roots was then tramped down and the hole filled with loose dirt that would not be packed. This vineyard was in addition to 54 acres of Emperors already in bearing.

REGULATION OF COMMISSION MERCHANTS.

Recognizing that the practices common in many of our terminal markets have caused a great deal of dissatisfaction among producers, and a consequent shattering of confidence even in the worthy agencies of distribution; Be it therefore

Resolved, That the National Association of Marketing Officials hereby places itself on record as favoring federal legislation for interstate shipments which will require commission merchants, and any other receivers of farm products on consignment, to keep a uniform system of accounts, giving each shipment a number in rotation, showing date and from whom received, date of sale, name of purchaser and price; a transcript of the entry sent promptly to shipper; all such records to be open at all times for examination by a shipper, or any state or federal market official. Be it further

Resolved, That for the proper administration of this legislation we favor the stationing of federal inspectors at all terminal markets.

INOCULATION FOR LEGUMES.

[By Prof. C. B. Lipman, University of Cal.]

One of the great practical achievements of soil bacteriology is the control of the soil organisms which have the power of fixing nitrogen from the atmosphere while growing in the nodules on the roots of leguminous plants. Our knowledge on this subject has been wholly given to the agricultural world through some of the most brilliant scientific work in the history of agriculture. From that we have learned to use pure cultures, and also soil already inoculated, to infect new soils with these valuable forms of bacteria. We have further learned through our investigations that the best method is the direct soil inoculation or the use of a suspension made up from a mixture of infected soil with clean water. Our inoculation experiments have been so far successful that 90 per cent of the trials have given successful results in inoculation; and even with the pure cultures, the Bureau of Plant Industry reports that for the last year 74 per cent of the trials have been successful. From our own practical standpoint, I should advise the inoculation of soils even where burr clover is found to grow wild, and where vetches and Canadian field peas will make a fairly good growth; because such inoculation by the soil suspension method which I have recommended can be done at no cost in a very short time and will make sure of more vigorous growth, other conditions being equal.

FROST OIL RESERVE.

[Written for Pacific Rural Press.]

Citrus growers who have provided smudge pots not large enough to burn through the longest probable freeze, may be in a hurry for fuel some time when the orchards are too soft for wagons or when burning pots would be in the way. It is then that 100-gallon storage tanks, stowed away under the trees, full of oil, as is done by the Pomona Land and Water Co. may save the orchard and certainly will save labor when rest is needed. G. P. Von Stein has added reserve besides 100 gallon tanks, by setting 5 gallon cans of oil about the orchard ready for use. He sets them under the trees in the springtime.

California grew and marketed the largest crop of walnuts in the history of the State, according to a report just received from C. Thorpe, secretary and manager of the Cal. Walnut Growers' Ass'n. The crop last year totaled 14,250 to 14,750 tons or 9,000 tons more than in 1914. The growers' organization handled 82 per cent more than in 1914. Less than two per cent of the crop is now in California.

Warden J. A. Johnston of San Quentin prison announces that he will have 4,000,000 grain bags to sell. The price was 9 cents until New Year's. New prices will be made soon.

He's Eating Up YOUR Money

DID you know the U. S. Government has shown that the ground squirrels on your place are collecting 34c from you every year for each acre of your cultivated land, in what they eat and destroy?

Furthermore, did you know that these little destroyers depreciate land values an average of $2.74 per acre? Can you afford to pay the toll? Stop it. Get rid of these pests that eat your crops, destroy your trees and vines, and spoil your land. It's easy and inexpensive to get rid of them with Kilmol.

Kilmol is a liquid chemical that both asphyxiates and poisons squirrels, gophers, etc.—Kilmol "will kill 'em all."

Waste balls are saturated with Kilmol. One is placed in each burrow, then ignited. The gas quickly penetrates to every part of the tunnel.

KILMOL
SQUIRLGOPHENE
Will Kill 'Em All

It "gets" Mr. Squirrel or Mr. Gopher before he can escape. One application, costing less than one cent per burrow for Kilmol, invariably does the business—it's 100 per cent efficient. Results absolutely guaranteed or money refunded. Kilmol can also be used with U. S. Destructor—a machine invented by U. S. officials that forces Kilmol gas into burrows—Kilmol is used by Government, State and County officers.

Ask your local dealer for Kilmol and waste balls. The waste balls you get from him are better and cheaper than home-made. If he can't supply you communicate with me, giving his name. Also ask him about improved United States Government formula of poisoned barley.

Write for full information about squirrel and gopher destruction.

RADIUM IN AGRICULTURE.

"According to recent experiments in Europe, it appears that Radium is instrumental in preventing diseases of plants, whence is likely to arise a new application of this interesting element in agriculture. For several years, workers in agronomic science have been experimenting with the effect of Radium upon vegetation by mixing Radio-active substances with usual fertilizers.. The numerous results obtained in this work show that most plants, either grain or flower, are remarkably stimulated and give a better yield, both in size and quality, this being often seen in the fine and healthy color of the green plants or leaves.

Under these conditions it is not surprising that the plants are in better condition to resist attacks from the various sources of disease such as cause so much damage to crops, especially diseases known as cryptogamic, which arise from spores or mold. It seems that Radium is to act as a preventive for such diseases as wheat rust, rotting of potatoes, grape vine mildew and many others, which cause such detriment to agriculture. Such results in the application of Radium in agriculture are likely to be far-reaching."

Radium material is now available for use in agriculture at a very low figure. We have a "booklet" full of information and established facts, on the application of Radium-bearing material. Send for it today.

Sulphur and Iron Bacteria Needed.

[By Prof. C. B. Lipman, Berkeley.]

While our common crop plants do not take up very large quantities of sulphur, a certain amount of that material is essential to the development of proteid material and therefore essential to plant and bacterial growth. Not only, therefore, is this material necessary in the soil for the development of the bacterial cells which are related to our ammonia, nitrate, and total nitrogen supply in the soil, but there are certain forms of bacteria which have as their function in the universe the control of the sulphur supply through its solution and through its oxidation and they are the so-called sulphur bacteria. Some of the recent investigations at the Wisconsin Agricultural Experiment Station would seem to indicate, moreover, that sulphur is an important element in the soil and may be lacking in soils, as potash and phosphoric acid may be, and therefore a supply of sulphur through gypsum, etc., may be as instrumental in increasing crops. Whether this, with further investigation, proves to be absolutely so remains for the future to show. We do know, however, that soil bacteria are intimately concerned with a supply of the sulphur in the universe and that there are some forms which have the power of breaking down sulphates and setting free sulphur in its elemental form; and other cell bodies which have the power of oxidizing this sulphur and producing other compounds which may be of use to plants.

So far as iron is concerned we have a similar relationship with the soil bacteria to that of sulphur. There are several forms of soil organisms which have the power of reducing iron from the sulphate of iron to the sulphides and some others which have the power of oxidizing iron to the ferric oxide form. These are very commonly found in the iron ore deposits and form very interesting subjects of investigation. Their practical value, so far, we can say but very little about. There can be but little doubt, however, that future investigation will show an intimate relationship between the chemical changes which iron undergoes in the soil and the bacterial activities there.

STATE WATER COMMISSION.

[From paper read by A. E. Chandler of the California Water Commission before the International Irrigation Congress, Sept. 15.]

Under the old California statutes no public offices had jurisdiction over appropriations. It was only necessary to post a notice, record it and to begin the work within a specified time and prosecute it with reasonable diligence to completion. It was this question of reasonable diligence in regard to which new legislation was most needed. Under the new statutes, as first adopted in Wyoming, a central office, generally the State Engineer (in California, the State Water Commission), has jurisdiction over all new appropriations. When it is found that an application will not conflict with existing rights and will not prove detrimental to the public welfare, it is approved by the central office and, in the approval, the time is fixed within which construction must begin, within which construction must be completed, and within which the water must be applied to beneficial use. The appropriator, therefore, knows before spending a dollar in construction, the exact time within which he must complete the several steps incident to his work.

In acting upon all applications where appropriations were made prior to the establishment of the Commission, the California Water Commission will favorably consider only those appropriations where work has been carried on in a businesslike way.

The law provides "that the water right granted by the State Water Commission can never be capitalized for either rate fixing purposes or for purposes of sale to a political unit.

Instead of allowing an appropriator to go ahead blindly and trust to luck that he will not be engaged in litigation, in cases where it is certain that no unappropriated water remains, he is not allowed to proceed.

It is in the interest of all that we should try in every way to cast off, so far as is lawful, the burden of riparian rights. The riparian doctrine is legally the one great obstacle in the way of the best development of our water projects.

WALNUT VARIETIES FOR LOWER SAN JOAQUIN.

[From paper by Dr. W. W. Fitzgerald, Stockton.]

The relation between quality of nuts and quantity produced by any variety should be carefully considered, especially as the demand is increasing for fancy stock.

Young trees often produce fair-sized nuts, but the size may decrease as the trees grow older. The weight of nuts varies widely in those of the same size. There is no doubt that dark-meated varieties will be less demanded as the lighter ones become more plentiful. Meats should practically fill the shells.

The varieties that do best in the lower San Joaquin valley are the Eureka, Franquette, Payne's Seedling, Meylan, Mayette, Parisienne, Concord, and Willson Wonder. The Placentia Perfection may prove itself a good nut for this locality.

DARK CORKY SPOTS ON PEAR LEAVES AND FRUIT.

To the Editor: What is the cause and cure for the black thickened corky spots of irregular size and shape that came mostly on pear leaves last fall a month or two early. Many of the limbs lost all their leaves last fall a month or two early. —Subscriber.

[A microscopic insect called pear-leaf blister mite does the work. It winters under the bud scales and begins laying eggs on the young leaves when the buds first unfold. This is the time to spray them with commercial lime-sulphur, 1 to 13, drenching all buds.—Editors.]

FRANQUETTE WALNUTS

We are offering a limited number of trees from our own imported stock.

Address:

VROOMAN ESTATE,

R. D. 5, Santa Rosa, Cal.

TREES

Consult us FREE

—about what you propose to plant this season. Our 31 years' experience and intimate knowledge of the requirements of each section enables us to rightly advise you about what and when and how to plant. It will cost you nothing to get our ideas and may save you a great deal of money. Send us your list for prices and suggestions.

All Varieties—Fruit and Ornamental

We grow everything that grows and guarantee all stock to be in first-class condition and true to name. Our packing facilities are the best and insure trees reaching you in good condition. Get our quotations on Apples, Apricots, Almonds, Peaches, Pears, Figs, Olives, Oranges, Lemons, Walnuts, Berries, Grapevines—Raisin, Wine and Table. Ornamental Trees, Vines and Plants, Palms, Cypress, Magnolias, Poplars, Oleanders, Field Grown Roses, etc.

WRITE FOR 1916 ILLUSTRATED CATALOG—FREE

It lists and prices all stock grown by us, over 2000 varieties. It is the most complete price catalog that we have ever issued. Write for a copy.

If you live in Southern California and it is more convenient to do so, you may address our agent, Roeding & Wood Nursery Company, 1617 East Washington Street, Los Angeles, who will give your wants the same careful attention that they would receive if placed direct with us.

The Tower of Jewels is Going

This great central feature of the great Exposition will soon be a thing of the past.

JEWELS OFF THE TOWER ONLY $1.00 EACH

These Jewels form an ever living reminder of this wonderful creation and will become more valuable as the years increase. Attached to each jewel is a bronze metal seal, proving that it came off the Tower of Jewels. This seal bears the name of W. D'Arcy Ryan, Chief of Illumination, P. P. I. E.

On receipt of $1.00 we will send you, by insured parcel-post, a jewel, just as it came off the tower. Your choice of five colors—White, Ruby, Canary, Emerald, Aquamarine.

To those who purchase five we will present one of the smaller jewels free.

The Jewels are going fast—Send for yours NOW.

TOWER OF JEWELS

A JEWEL FREE With Each Purchase of Five

'Coates' French Prune

Has Proved a Winner

Why plant prune trees propagated from trees bearing small grades of fruit? We have our own trees, from which alone we cut buds. A customer sends us samples of the fruit, weighing 2 oz. each. Our budded and grafted Walnuts cannot be surpassed; propagated from our own bearing trees.

Our "pedigreed" (not "selected") Blenheim Apricot has 'made good.' Full line of Nursery Stock; see list and prices of ornamental stock. Landscape Gardening a specialty. Good Agents wanted.

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

DRIED PEACHES BY MACHINERY.

[By G. W. Harney, Marysville.]

It has occurred to me that formation of the newest of fruit associations—the Peach Growers' association—offers an opportunity to the manufacturers of farming machinery, especially tractors, to easily demonstrate that the production of dried peaches can be carried on almost entirely by machinery; the association will make prices stable and insure a steady market for the product, for the reason that dried peaches can be produced in quantities only in California by the economical sun-drying process. Sun-drying in the Eastern states is not practicable on account of summer rains and humid climate.

With the sales department organized and a market assured for the product large profits can be made by cutting down cost of production, and this can be done by machinery in the case of dried peaches more simply than with any other fruit product.

Would it not be possible to make a tractor do all the work on eighty acres of freestone peaches with the labor of five men? The tractor will do all the plowing, harrowing, rolling, hauling and pumping required. By putting a platform on the tractor for the men to stand on four men could do all the pruning. No ladders to move, no climbing up and down, no lost motion. A compressed air tank and a spray tank on a platform on top of the tractor, and two men could do all the work of spraying. Furthermore, there would be no delay in spraying, as the tractor could go on the ground at any time of the winter without miring.

The peaches, when ready to cut could be shaken from the trees to sheets, rolled into picking boxes and the boxes carried to the cutting shed on a carrier, tram or track system, operated by the tractor engine; then run through pitting and halving machines and delivered on trays on trucks, cup side up ready for the sulphur house; the tray full of sulphured peaches to be later run on tracks to the dry yard. The tractor at a central point would run the machinery—the tram-carrying system, pitter, etc.

Of course the whole plant would have to be arranged according to some definite system, and a crew trained. The trained men would receive a high wage and be housed in the best of style. If I ever plant another peach orchard, and I am seriously thinking of planting one to standard freestones with a view of producing dried peaches exclusively, I certainly will have it arranged so that all the work can be done by machinery, operated by trained men.

REDWOOD PIPE LONG USED.

To the Editor: Replying to yours of the 16th inst. regarding my experience with redwood stave pipe, would say that it is entirely satisfactory.

A six-inch line of this pipe was laid ten years ago and except for one or two leaks which were easily repaired, it has given good service, in spite of the fact that the pipe is empty five to six months of the year.

Another line which we started last spring and finished this fall contains 2200 feet of eight-inch pipe. Believing that this wooden pipe would last longer when filled all of the time, we have connected this line with the tank at the house. As this tank is supplied with water by a 1 h.p. Luitwieler pump, we do not have to start the large pump which supplies the 8-inch line with water, when we wish to fill the pipe. In fact, after we finish using the large plant we close the outlets to the eight-inch pipe except an air release valve at the upper end, and turn on the water from the tank which automatically keeps the line full.

Another suggestion which we think is of great importance is the insertion of air relief valves wherever there are pockets for air to gather. With the elimination of all air from a line, it would be a common thing to see redwood pipe which had been installed twenty years or more in as good condition as the day they were laid.

Woodlake. **Frederic Kitchener.**

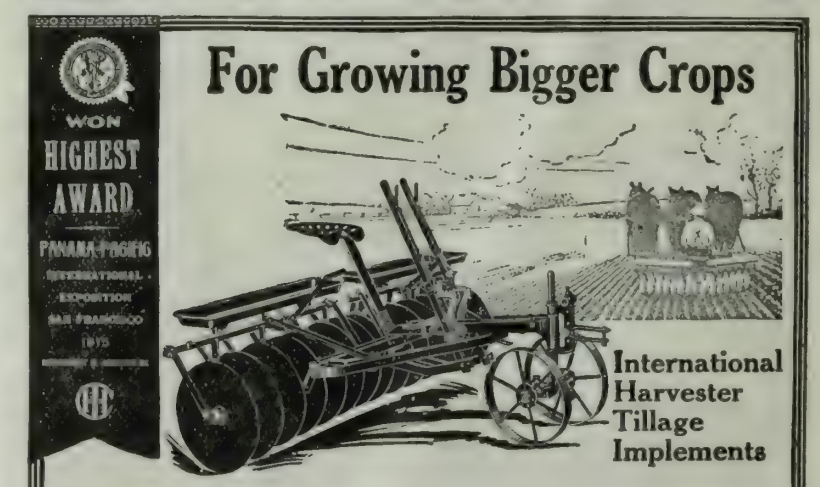
WANTS BATTERYLESS ENGINE.

To the Editor: In the issue of Dec. 4 you describe an "Engine with No Batteries." Can the magneto of this engine be obtained separately and fitted to any make and break ignition? If so, where can it be had? —T. P. I., Sebastopol.

[Answered by De Laval Dairy Supply Co.]

[It will not work on other engines than the Alpha, because it is built in, and depends for its efficiency on its harmony with the rest of the engine—being geared and timed for the particular one on which it is used.]

BUYS SIX TRACTORS.



Some time ago a Caterpillar tractor without wheels to run on the ground, being guided by increasing or decreasing the speed of the track on one side or the other, was reported as being nearly ready to put on the market. The convenience of this type is such that Mrs. M. S. Bordges has recently ordered six of them to use on her ranch in Monterey county. One was tried out at first, checking land for irrigation. It did the work rapidly and was easily driven on the soft plowed ground.

POWDERED CHALK FOR LEAKY TIRES.

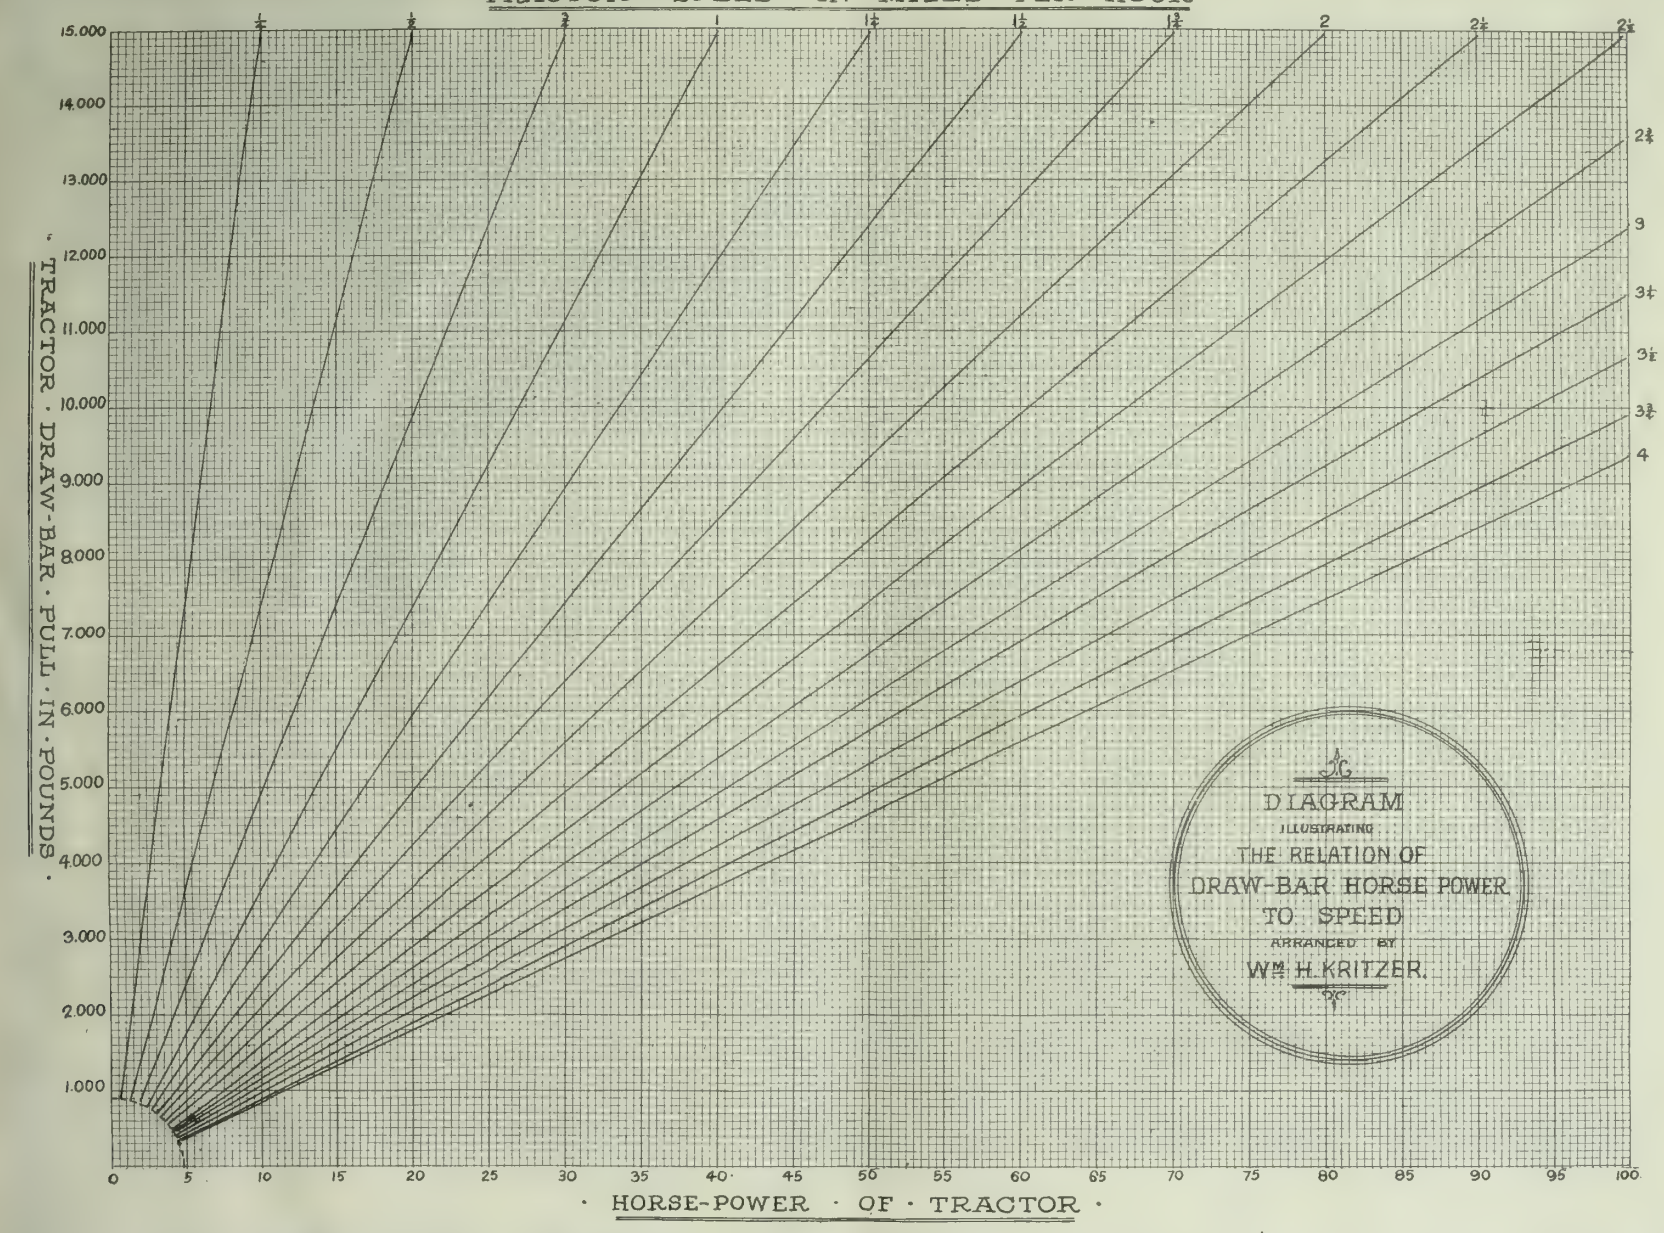
"Neverleak" sometimes spurts out of a tire and spoils a fellow's clothes. French powdered chalk made into almost gravy consistency with water and forced into a deflated tire does all that Neverleak would, according to A. S. Nott of Los Angeles county, and is easy to clean from clothes in case of accident. The air pump is filled with the semi-liquid mixture, which is then pumped into the tire.

HOW TO FIGURE TRACTOR HORSE POWER.

[Written for Pacific Rural Press by Wm. H. Kritzer.]

By referring to the illustration a person can quickly determine the approximate draw-bar horsepower of a traction engine.

The diagram is figured and drawn from the following formula as a basis, in which "H P" equals draw-bar horsepower. P equals draw-bar pull. S equals speed of tractor, in miles per hour. Thus, H. P. equals $\frac{P \times S \times 5{,}280 \text{ ft.}}{350 \times 60}$



Example:—Given the horsepower of the engine or motor and the speed it travels in miles per hour, to find the draw-bar pull of the tractor, first, find the vertical line which corresponds to the horsepower rating of the engine or motor and follow that line up to where it crosses the sloping line which indicates the tractor speed in miles per hour. Then follow the intersecting horizontal line to the left, obtaining the draw-bar horsepower delivered.

Brake horsepower represents the power that a tractor can deliver at the pulley or fly wheel for belt work.

Draw-bar horsepower or "traction horsepower" represents the brake horsepower that a tractor can deliver at the draw-bar, when the tractive surface is comparatively level and solid.

A "horse equivalent horsepower rating" means the number of good work horses the tractor will displace, when running on a level and firm footing, the pulling power of a horse being commonly known by the term "draft" when compared with the draw-bar pull of a tractor.

[The chart may be used to find what horsepower tractor one wants to buy for his work. If the work equals a pull of so many pounds at a certain speed per hour, the corresponding horsepower engine can be easily located. If one has a tractor of known horsepower and wants to haul a load 4 miles per hour on a level road, he can figure how much of a load is possible.—Ed.]

48 tons by hand

One man, alone, can pull any stump that can be pulled by any horse power machine. Merely work a lever and easily pull 48 tons weight—all an inch-steel cable will hold. A mechanical wonder.

HAND POWER
K Stump Puller

Made of Krupp steel—weighs only 171 lbs.—two speeds—endorsed by U.S. Government experts. Works on hillsides and marshes where horses cannot operate. One man and a K can clear single-handed from 50 to 100 stumps per day.

Send for my special offer and free book on Land Clearing.

"Jackson MADE"

A Better Make Not Made

Write for Catalog No. 47 F

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

R. F. Fullington of San Martin, Santa Clara county, has purchased a few avocado trees which he will plant as an experiment on his ranch.

Some orange picking was reported at Corona, December 30, but it was not thought that the packing season would be in full blast before January 15.

Riverside's exhibit at the National Orange Show at San Bernardino next month will consist of a part of the Santa Fe Indian village which was shown at the Panama-Pacific Exposition at San Francisco.

Practically all of the navel orange crop of the Lindsay district of Tulare county has been shipped, there remaining but 50 cars on December 31 still to go. There were 1804 cars shipped from that place up to that time.

Notwithstanding low temperatures and in many instances snow, the citrus sections of the State seem to have escaped any damage the past week. Rains followed the snows in most instances which overcame severe freezing.

Reports from Florida are to the effect that fully one-half of the citrus crop of that State was moved before the first of the year 1916. The total shipments to the first of the year were 1607 carloads of grapefruit and 7558 carloads of oranges.

Estimates are being made that the orange crop of the Pomona district will amount to 3500 cars this year. It was thought early in the week that the first car would be shipped about January 10.

Reports from the east are to the effect that the trade there is very well pleased with the California oranges which have been received this year, one report saying that there is no comparison between the quality of early oranges this year and those of previous years.

We are advised by the Wallace Nurseries that the outlook for the sale of citrus trees the coming year is especially good. They are receiving inquiries already from prospective planters and this fact would indicate that there will be a heavy acreage planted this year. The high prices being received this year will no doubt influence many land owners in this respect.

DECIDUOUS FRUITS.

Tree planting was started last week in the vicinity of Newcastle, according to reports from that place.

C. K. Turner, Horticultural Commissioner of Placer county, reports brown apricot scale prevalent in Placer county this year. He is recommending the use of oil or distillate sprays.

The "Fruit Special" train which is to take all of the prominent fruit shippers, packers and handlers of fruit to the convention of Western Fruit Jobbers at Memphis, Tenn., will leave Sacramento January 11.

According to Geo. P. Weldon, assistant State Horticultural Commissioner, there is an urgent need of reliable statistics on fruit production in this State which cannot be secured under the present system.

The Cal. Development Board publishes railway statistics showing California's 1915 fruit production to be worth $90,000,000, fuel oil $52,000,000, hay and forage next, butter $20,000,000, gold $20,000,000.

Preparations are being made for a heavy planting of prune trees in Sonoma county this year, according to advices from there. Owners of vineyard land which is suitable for prunes are said to be buying prune trees in large numbers.

M. R. Struble, manager of the Penryn Fruit Growers' Ass'n reports 200 acres newly signed up for the 1916 season. They market through the California Fruit Exchange, a growers' organization, which now has 1600 members from Imperial to Shasta counties.

Plans for the final meeting of peach growers at Fresno January 12, at which time a permanent organization will be formed, officers elected and definite plans outlined for the work of the California Peach Association during the coming year, were well under way the first of this week.

According F. S. Jerome, president of the Watsonville Apple Distributors, there were approximately 5,000 carloads of apples grown in that section last year of which about 40 per cent went to the dryers, the balance being shipped out. The membership of that organization is given at about 500.

State Market Director Weinstock plans to help standardize dried fruit packs by establishing a standard. Fruit will be entitled to a State label when certified up to standard by State inspectors. The Market Commission proposes to endorse warehouse receipts of standard goods. These receipts may then be used in New York or elsewhere as collateral for loans up to 80 per cent of full value at 3½ per cent interest. The New York State Marketing Bureau will co-operate to find consumers for California products.

VINEYARD ITEMS.

A large acreage of Thompson Seedless grapes are being planted by farmers in the vicinity of Yuba City.

Several large tractors are at work tearing out the vineyards on the Stanford University ranch in Tehama county. The land is to be planted to alfalfa.

Pruning of hillside vineyards near Livermore Valley is now under way. Pruning of the vineyards in the valley is being delayed for fear the warmer soil will force the buds and increase frost danger.

Unless the Associated Raisin Company is able to sign up 15,000 additional acres by April 1, that company will change from a growers' co-operative selling agency to a mere packer, and return to the speculative system of raisin selling previously practiced. Such is the ultimatum given out last week by the directors of the association. The increased acreage in the past three years is responsible for the association only controlling 60 per cent of next year's crop, instead of 90 per cent heretofore. It is believed that the required acreage will be secured in a short time if all growers co-operate.

OLIVES AND NUTS.

The Almond Growers' Ass'n at Guinda, Yolo county, elected new officers last week. E. E. Curtis was elected president.

A large acreage of almonds will be planted near Orland this year. A. Smith will plant 100 acres and J. J. Flaherty and John Lackenmeyer will plant 45 acres.

California Fruits and How to Grow Them

EDWARD J. WICKSON.
Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

PACIFIC RURAL PRESS, Publishers. 525 Market Street, San Francisco.

Some of the larger olive packers of the State are complaining of the sale of home-packed olives on the ground that they are being thrown on the eastern market at ruinous prices to the trade in general.

A carload of 10-cent cans of ripe olives were shipped east this week by the Porterville cannery. There are 160 tons of olives in that cannery and 200 are expected before the end of the season.

There are 800 acres of bearing almonds in the district adjacent to Banning, Riverside county, and 300 acres more to begin bearing soon. This is one of the largest acreages of almonds in Southern California.

A report from Oroville states that the recent cold spell has caused the olives there to shrivel up so badly that no more packing will be done. It is estimated that half to two-thirds and in some instances 90 per cent of the crop was canned.

GENERAL NEWS.

The rice acreage at Wasco, Kern county, will amount to several thousand acres the coming season.

The Pacific Rice Growers' Ass'n report the sale of almost 10,000 sacks of Jap rice at $2 a cwt. on December 30.

A Los Angeles company is said to be planning to plant 160 acres of land to alfalfa in the Pixley district of Tulare county.

According to advices from Tulare county most of the grain land in the Lake region is already planted, the acreage being about normal.

A. E. Lindstrom of Orland is reported to be installing an underground irrigation system on his 40 acres of alfalfa and fruit land.

J. J. Rooney of Chico shipped two carloads of hops east last week. This is his first shipment of the season and is only a small part of his total holding.

There have been about 700 acres of sugar beets planted near Alpaugh this year and most of them are already up, according to advices from there.

A report from Yuba City states that there is a likelihood of the Alameda Sugar company planting their 20,000 acres of sugar beet land to rice the coming year.

It is estimated that there are still 100,000 sacks of beans in the Stockton warehouses. This is a much smaller amount than has been usual at this time in previous years.

Northern and Central California have had a poor honey season, chiefly due to adverse climatic conditions Butte county is an exception due, it is said, to the prevalence of star thistle.

Alfalfa hay is bringing $10 per ton baled, on the ranch, and $12 delivered at Yuba City. Several hundred tons of hay have already been shipped from that section at the above prices.

Alfalfa hay supplies are short in Imperial Valley this winter as in most other alfalfa growing districts. Reports from there say that the increase in livestock is the cause of the present shortage.

The Spreckels Sugar company received two carloads of sugar beet seed at Soledad, Monterey county, last week. The seed was passed on by J. H. Hichman, County Horticultural Commissioner of that county.

Bean growers in Ventura county who planted a catch crop on their bean land report a gain in the yield of beans of seven sacks to the acre. Potatoes were planted on the ground in the spring before the beans.

After conducting experiments on 12 different plots in Napa valley, H. J. Baade, county farm adviser, reports that unless a person has irrigation water it is not advisable to try to grow sweet clover in that section.

A carload of alfalfa seed was destroyed by Horticultural Commissioner Roullard of Fresno Co. last week. The shipment was seized some time ago and upon examination was found to contain both harmful weed seeds and insects.

Grain growers in the Oakdale district of Stanislaus county were busy before the last rain, preparing their ground and planting. They are expecting to plant a record-breaking acreage if weather conditions will allow them to.

The recent cold spell made the potato growers in the Delta district happy as it put the tubers in excellent condition for shipping. Digging is now well under way in that section and storage space in Stockton is rapidly being filled up.

A carload of beet seed was received at Manteca last week for the heavy planting of beets which is to be made in that vicinity the coming year. Satisfactory yields were secured there last year and an increased acreage is the consequence this year.

The Merced river corn crop is being moved to market at this time, there still being about 2,000 tons of the crop in growers' hands. The quality of the corn there is said to be especially good this year and growers are receiving $1.50 a hundred for it.

There are at the present time about 50,000 bales of hops in the hands of Sacramento valley hop-growers. Prices offered are eight to ten cents a pound. A meeting was held last week at Sacramento at which time steps were taken to form a hop growers' association.

An irrigation district containing about 22,000 acres has been formed in Lassen county and will be known as the Southern Lassen Irrigation District. There is much good land in that district which has been handicapped by lack of water heretofore.

About four tons of bell peppers, string beans, peas, tomatoes and eggplant are being shipped daily by the Orange County Vegetable Growers' Ass'n. It was expected that by the end of last week they would be making carload shipments of vegetables to the Chicago markets for the holiday trade.

CITRUS FRUIT GROWERS TO MEET.

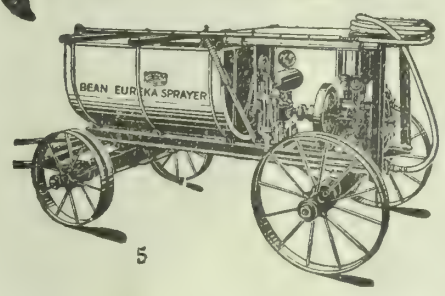
The Forty-eighth State Fruit Growers' Convention Citrus Special will be held at San Bernardino, February 18th and 19th, 1916. The orange discussion will be led by C. C. Chapman who will speak especially of the possible value of a "brand." The discussion of the lemon will be in charge of C. C. Teague. A. D. Shamel has kindly consented to speak of the pomelo. Marketing will be discussed by our new Commissioner of Marketing, Colonel Harris Weinstock. Dr. G. Harold Powell will speak on the problems of the citrus industry. The citrus outlook of the north, Butte, Sacramento and Tulare counties, will be presented by Fred Mason, W. W. Hinsey and H. Webster, respectively. Soils and soil fertility will be discussed by the Messrs. H. J. Webber, I. G. McBeth and W. P. Kelley, three very able soil experts. The 8 to 1 orange test will be explained. Professor H. J. Quayle will give the latest on fighting scale insects. E. O. Essig and H. C. Bryant will give lantern talks on insects and birds, respectively. Col. Weinstock will repeat the address which he gave at Visalia, which elicited great praise.

One-Man Power Sprayer

A Complete High-Grade Outfit at Small Cost

Here's the rig thousands of small farmers, orchardists and vineyardists have been looking for—a dependable, reliable, efficient, high-pressure power sprayer at small cost. One man does all the spraying. One horse can haul it anywhere. Supplies one line of hose and will cover from 2 to 3 acres a day. This is the first time you have been offered Bean quality in a low-priced outfit. Note these features of the

BEAN EUREKA



LIGHT WEIGHT—Makes it an easy pull for one horse and a mighty handy sprayer for rough and hilly land.

INEXPENSIVE TO OPERATE—One man does it all. Low first cost and practically no cost of upkeep.

NOVO ENGINE—as sturdy a sprayer engine as you can find. Novo spells satisfaction.

ALL COMPLETE—Including Patented Pressure Regulator, Rotary Agitator, Truck, Canvas Cover and Curtains, Hose, Rod, and everything complete.

THIRTY YEARS OF EXPERIENCE are back of the Bean Eureka—and experience counts.

Made from the right crude

The Jury of Awards at both San Francisco and San Diego Expositions found an oil made from California asphalt-base crude, highest in lubricating efficiency. That oil was Zerolene. The fact, too, that such unbiased authorities as a U. S. Naval Engineer, engineers of the Packard and Ford Motor Companies, and others, have also gone on record in favor of oils made from asphalt-base crude—in accord with the decision of the Exposition juries—proves that Zerolene is made of the *right* crude, and made *right*.

SOUTH AMERICAN PRUNE MARKETS AWAIT US.

A prune market heretofore neglected by dealers is awaiting us in South America which cannot now get their accustomed European prunes. The following from the U. S. Dept. Agr. is interesting:

"There is apparently an opportunity for the American prune in South America. Approximately a quarter million dollars' worth of prunes are imported annually into South America under normal trade conditions. Of this, the United States, the largest prune-producing country of the world, supplies only about five per cent. Argentina's importations of prunes in 1912, the latest normal year, amounted to over $100,000, and those of Brazil to a like sum, though the exact figures for Brazil can not be stated. Uruguay is also a considerable importer of prunes, and all these countries have in the past drawn their importations from France and the Balkan States, which are next to the United States in rank of world producers of prunes. They have also drawn large quantities from Germany; and as the imports from all these European prune-supplying areas are now either cut off or greatly reduced, the opportunity is open to the American growers, who can reach the South American market from the Pacific Coast by way of the Panama Canal at much less expense than formerly. In the fiscal year 1913 the United States exported 118,000,000 pounds of prunes, valued at $6,656,000, of which only 196,000 pounds, valued at $14,000, went to South America."

TREES DIE MYSTERIOUSLY.

To the Editor: We have a small young prune orchard in Santa Cruz county hills which was originally in brush, was planted to fruit trees many years ago, and most of the old orchard died. It was reset to trees some of which have died already. We find a felty fungus in the roots. What kind of spray will help?—Sub.

[No spray will help. Several fungi might cause the "felt," but the chances are that your trouble is oak root fungus. If so, you ought to be seeing toadstools in clumps at this time of year growing from the ground around the trunks of infected trees. Digging carefully you would find "roots" of the fungus in the soil and infected roots. They have a white center with a brown cover. The fungus has a clean toadstool smell. Pears, black walnuts, figs, and cherries seem most resistant. No practical method of killing it has been worked out, though its spread can be stopped by digging a trench three or four feet deep around infected areas, filling it with dirt which does not contain diseased roots, and open the trench regularly every three years.—Editors.]

WALNUT ROOT STOCKS.

[From paper by Dr. W. W. Fitzgerald, Stockton, read at Visalia Fruit Growers' Convention.]

It is hazardous to grow walnuts where the watertable rises nearer the surface than eight feet. The California Black root will stand more moisture than the English, while the Eastern and the Royal Hybrid will stand a great amount. Southern California Black does not do well on heavy moist soil. Eastern Black is

NORTHRUP AVOCADO

Important

Your order for Avocado trees should be sent in at once; the demand is heavy and all available trees of the most wanted varieties will be sold up soon.

Don't wait another year, but plant your Avocado trees this season. Make your selections from my 1916 catalog—only the best and proven varieties are offered you—such as will produce quick and satisfactory results. Choice trees at from $1.50 each and up, according to size, variety and quantity wanted—

Northrup, Ganter, Harman, Taft, Chappelow, Challenge, Wagner, Sharpless and other.

If you have not received my illustrated and descriptive catalog, write for it at once. Make your selections and mail your order.

Explicit instructions for planting and cultivating the Avocado sent with each shipment.

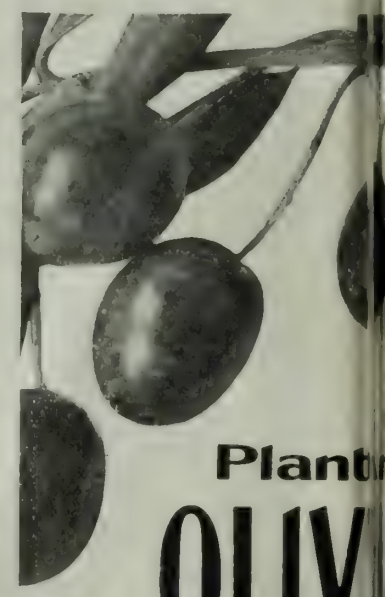
Order and Plant one of my $10.00 Model Orchards for $5

Just to demonstrate the quality of Armstrong Trees and their fruits. I am making this "special offer." The trees and plants, which are personally selected in making up this model home orchard—if ordered separately, would cost you $10; but I want you to test my products—there's 30 distinct varieties of fruit, selected from the best, ripening in succession from May to December:

PEACHES, APPLES, PEARS, APRICOTS, PLUMS, CHERRIES, NECTARINE, QUINCE, BERRIES, GRAPES, ETC.

—each tree and plant labeled. **IF DESIRED WILL PREPAY EXPRESS to all points south of the Tehachapi for 50c, and to points north in California for 75c additional, and guarantee arrival in first-class condition.**

ORDER AND PLANT THIS MODEL HOME ORCHARD NOW.



TRUE TUSCAN CLING.

True-to-Name Peach Trees

SOUTHERN GROWN

—27 varieties — best for commercial plantings in California and the Southwest—varieties that are wanted for canning, drying; also the best for home use and shipping.

THRIFTY
Pear Trees

If you want best results, plant **ARMSTRONG QUALITY** Pear Trees, Bartlett and fourteen other standard varieties; also ten varieties Dwarf Pears. The trees are of superior quality, thrifty, vigorous, well-rooted, absolutely free from blight, carefully dug and packed—and will reach you in best of condition for planting. Plant the best; they cost no more. Write me, stating number of trees and variety wanted, and hold your order until you receive my lowest prices.

BARTLETT PEAR

Better---
Walnut
TREES

Clean, thrifty, vigorous trees, propagated from the best nut-bearing trees in California. My Walnut trees, when properly planted, start right off and grow and come into bearing early.

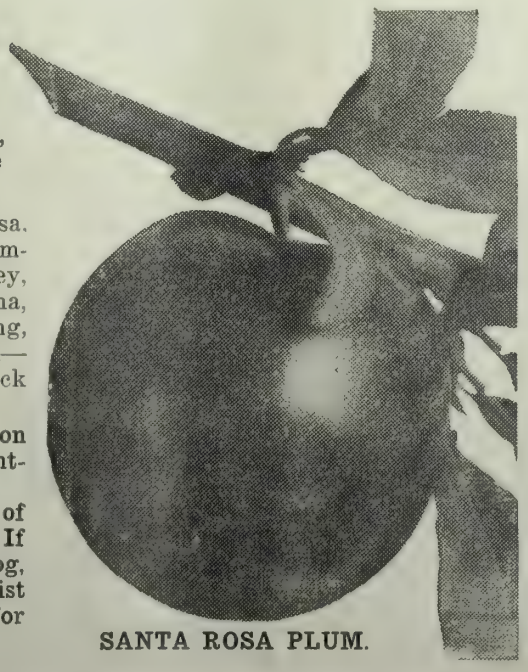
PLANT THE BEST, THEY COST NO MORE.

Lowest prices quoted promptly on request. Write stating number and variety wanted and hold your order until you receive my prices.

The World's Finest
APPLE
TREES

Every desirable variety---such as are adapted to both high and low altitudes

The quality of my Apple Trees is, without a doubt, **the best obtainable**—straight and thrifty, with ideal roots, and by my method of digging, packing and shipping, you are assured of best results. See pages 17 and 18 of my 1916 catalog for varieties, prices, etc. Special prices will be quoted by letter on large lots. Write, stating your requirements.



Plum Trees

of all Wanted Varieties, for commercial and home orchards.

Santa Rosa, Gaviota, Formosa, Duarte, Burbank, Climax, Damson, Green Gages, Kelsey, Prunus, Pessardi, Satsuma, Wickson and others, strong, vigorous trees, well rooted—such as will make a quick growth and bear fruit early.

Will quote lowest prices on large lots for commercial plantings.

Write, stating number of trees and variety wanted. If my 1916 combined Catalog, Planter's Guide and Price List is not in your home, write for a free copy NOW.

SANTA ROSA PLUM.

too slow a grower. Paradox hybrid, a cross of English and California Black, has several weaknesses of its English parent. Royal Hybrid nuts used for root stocks should be only the first generation cross between California and Eastern black. Others may prove disappointing. First generation nuts produce trees which grow at least a third faster, produce a tree earlier and give larger crops due to the increased size and vigor of the tree. Their roots are the best all around stocks for English walnuts for the San Joaquin valley. They are practically immune from oak root fungus so far as known. The California Black is the most common root for California budded or grafted walnut trees.

INTERESTING NOTES ON RYE AND ORCHARD GRASSES.

[Written for Pacific Rural Press by Albert F. Etter.]

Commenting on the query of "W. W. M." of Dixon on rye grasses in a recent issue I would suggest that its ability to withstand submergence is limited if completely covered. However it will grow in the water for weeks if the tops are above water. Again, if cut below the surface of the water, it will drown in a few days. It will stand complete submergence for a much longer period in running water than in stagnant water, and in cool, than in warm, weather.

As regards desirability for permanency in northwestern California, speaking in particular for the parts with least fog, rather than those with the most, orchard grass among all cultivated sorts of which seed is easily obtainable, is the best. When once set it is about as nearly permanent as we can hope for and thrives under many conditions from moist to dry, rich to rather poor, growing among weeds and brush and enduring much abuse such as all good grasses in range practice must meet. Its ability to "catch" is limited to a burned brush patch, or cultivated ground. To sow on open, natural range is a waste of seed, as it will not establish itself.

Briceland, Humboldt county.

SAFE ORANGE CLIPPERS.

[Written for Pacific Rural Press.]

About the handiest and safest orange clippers we have seen are those used by J. E. Murphy of Los Angeles county. They have stubby, almost hemispherical jaws which cannot scratch or cut the skin. The cutting edges are countersunk so that with the jaws open and resting on the orange, when they close, they slide up over the button and cut the stem close. There is a V indention where the points would come together to help get the stem between them. The cutting edge is not made to be sharpened, but is cleaned with emery paper. The only inconvenience is that when twigs or leaves get in ahead of the orange stem, the jaws are too short to reach the stem. Even this is an advantage in keeping pickers wide awake to handle every orange carefully.

The U. S. Dept. Agr. reports kafir, milo, feterita, etc., to have yielded an average of 28.4 bushels of grain for U. S., 35 in Col., 32 in Tex., 28 in N. Mex., and 26 in Okla

Wooden Gopher Trap.

[Written for Pacific Rural Press.]

"The only way to know your citrus trees are safe from a gopher that has made its appearance is to trap him," says H. E. Wilkinson of Los Angeles county. A good trap used by another citrus grower of that county, R. Hefty, is built about as follows: It is a wooden box 3x6x2½ inches inside, with one end and the bottom left off. A coil spring horizontally across on the top near the back or closed end naturally holds its rectangular wire extension nearly vertical. This extension is built to fit around the edges on top of the top board and across just back of the other end. From the end of this rectangular loop, another one about 2¼x2¾ hangs loosely so that when the big one is held flat on top of the box by the trigger, the little one hangs close to the sides and across the bottom. The big loop is short enough so that the little one works up and down through the narrow notches cut into the top of the box from its end.

The trigger has two parts. A notch is cut through the top of the box just forward from the spring, an inch or two lengthwise of the box and a saw thickness wide. Through this is dropped a small stiff wire about 6 inches long with a loop on its lower end to hang crosswise of the box inside near the bottom. Another loop is made in the wire where it passes through the top so that it will work loosely on a finishing nail driven for an axis across the top of the box and the center of the slit. A quarter inch of the upper end of this wire is bent at right angles, toward the closed end of the box. When this is done, it projects only a half inch above the top. The other part of the trigger is a wire looped through a staple in the center of the forward end of the top so that it may be laid back over the big wire loop on top to the bent end of the vertical part of the trigger. There a quarter inch of its end is bent at right angles toward the side of the box so that the bent end of the vertical wire can engage it. The bait is put in the closed end of the trap. The gopher runway is dug out so the trap can be set into it and is surrounded with dirt. The gopher in attempting to get to the bait shoves the loop on the trigger which is thus disengaged above and the loop springs up, catching the gopher around his body and holding him against the under side of the top.

PREFERS REDWOOD PIPE.

Answering our inquiry regarding the Honora Realty Co.'s experience with redwood stave pipe near Lemon Cove, E. E. Goodale writes: "We are using about two thousand feet of redwood stavepipe, and it has given such perfect satisfaction that we have just closed an order for five thousand feet more varying in size from 4 inches to 8 inches in diameter. Some of it being built to stand a pumping pressure of seventy-five feet. The pipe we use is a product of the Redwood Manufacturers Co. of Pittsburg, Cal., and is made with a guarantee to do as it is supposed to do.

"Some of the pipe we are using is laid upon the surface of the ground with no covering at all and held in place by stakes driven in the ground. It has been in use one season. Part of the time, it has had no water in it, at the same time being exposed to the hot summer without being injured in the least. Other pipe we have under pressures varying from ten to twenty-five feet; and in the whole of it there has not been one leak nor the least bit of annoyance.

"We are using several miles of cement and steel pipe and we find the stave pipe cheaper than the steel and more lasting and we find it, where pressure is to be considered, better and about as cheap and much more satisfactory than cement.

"As a pipe to be used in the transportation of water long distances, and as a pipe to be used in the transportation of water where pressure is to be considered, a better, or a cheaper, or a longer lasting pipe is not to be found."

W. B. Nichols of the First National Bank of Dinuba writes: "The pipe which we have been putting in has not been tested out as yet; however, so far as workmanship and manner of going together is concerned, it is entirely satisfactory and I have every reason to believe that it will stand all reasonable tests and prove just what we want."

A block of Tragedies on the J. B. Cory ranch in San Joaquin county, next to a block of Robe de Sargents, shows markedly better crops on trees which are closest to trees of the other variety.

The California Food Products company which was incorporated last week have announced that they will immediately construct two new cotton gins in the Imperial valley which with their other three gins will enable them to handle a much larger volume of cotton seed. The company also proposes to put several new food products on the market, to be made from cotton seed.

WANTED GOOD FARM, or unimproved land from owner H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

FOR RENT—300 acres of alfalfa land. Apply to J. H. Glide, care West Sacramento Co., Sacramento, Cal.

Have you this Book?

—if not, it will be our pleasure to mail you a free copy, *provided*, you will write us the number of Citrus trees and varieties you will require. Besides giving exact information on orange and lemon growing from seed to harvest, from packing house to market, it also describes

TEAGUE QUALITY CITRUS TREES

—giving the history, character of tree, and quality of fruit produced by the standard and ornamental varieties mentioned in the opposite panel. The book is sumptuously illustrated, thus affording a splendid object lesson of California's great citrus industry.

—for the past twenty-six years we have made the growing of citrus trees and the development and management of orange groves an exclusive business. This of itself insures quality in our nursery trees that no one contemplating planting an orchard can afford to neglect, particularly when we are offering stock at prices that are the lowest for the best trees that can be produced. Write us to-day.

How Old is Your Horse?

[Written for Pacific Rural Press.]

What is the age of your horse? Most any experienced horseman will answer the question almost as accurately as though he had raised the horse himself if he can get at the animal's mouth a minute or two. The practice is as old as the hills, yet many a horse owner doesn't know the principles for determining ages in this manner, and a horse's age is of great importance in determining values.

The incisor teeth of the mature horse, of which there are six on each jaw, are most commonly used for age judging. The first pair of incisors make their appearance on the colt's jaws, both upper and lower, soon after foaling, and at six months of age a colt should have all three pair.

Three Years Old.—The permanent pair of center incisors do not generally replace the temporary incisors till a horse is about three years old, at which time they are ready for use. These are longer than the temporary teeth and easily recognized by the deep, hollow cups.

Four Years Old—At four years, the intermediate pair of permanent incisors are up and ready for use. The cups in the center pair are now about one-third worn down.

Five Years Old.—The five-year-old horse should have all of his permanent incisors. By this time the cups of intermediate incisors are worn down about one-third, and the center ones have become rounder on the inside and show wear. The cups are now about two-thirds worn down.

Six Years Old.—At six years the corner incisors show one year's wear on the cups, the intermediate cups are reduced to one-third, and the cups in the center incisors on the lower jaws have practically disappeared.

Seven Years Old.—By this time the cups in the corner incisors are badly worn, and nearly disappeared in the intermediate incisors. Where the upper corner tooth overlaps the lower one a notch appears. The teeth have become rounder from the outside and are thicker in shape, also meeting at a sharp angle.

Eight Years Old.—At this time the cups in the upper jaw incisors are showing wear, and the cups in the lower corner incisors are about worn down.

Nine Years Old.—Because of the fact that cups in the upper incisors do not disappear at such regular intervals as in the lower teeth, it is not so easy to determine age accurately by this time. Usually, however, the cups in the upper center incisors have worn off by this time.

Ten Years Old.—The teeth now are more triangular in shape and the cups in the upper intermediate incisors are about worn down.

Eleven Years Old.—While in some horses cups are still found in the upper as well as lower incisors, it is not unusual to find cups in the upper teeth for two or three years yet. The cups at this age have, however, usually disappeared.

Twelve Years or More.—With increasing age, the incisors of upper and lower jaw become more triangular and meet at a sharper angle. At this time a horse's worth is largely dependent upon his individuality, and a year or two one way or the other is not nearly as important as his general ability.

CREAM POOLING ASSOCIATION.

Dairymen in the vicinity of Ripon, San Joaquin county, have recently formed a cream pooling association, through the efforts of the County Farm Bureau and the local Farm Center.

The association controls the output of 1,000 cows in that territory, and have contracted with a Stanislaus county creamery for their entire year's fat production.

As the dairies in that section are usually small, and the cost of cream collection runs up on that account, it has been possible for the association to secure a better price than has heretofore been possible for its members. The association has its own tester and in case of any dispute between patrons and creamery regarding the test, the case is put into the hands of a grievance committee, composed of one dairyman, a representative of the creamery and a person who is neither a dairyman or creamery man. Results in this particular case have been satisfactory so far and steps are being taken to organize dairymen in other sections of the county in the same manner.

Objections to the plan which have been made to us by creamerymen are that it gives undue advantage to the large plant who is financially able to handle a large output and takes the matter of quality out of the hands of the creameryman to a large extent. Only time will tell whether the plan is a good one and worthy of more extensive practice, but in the main it is poor practice to freeze out the little buyer to be later man-handled by the larger one when he gets a monopoly.

Save Money on Wire Fencing!
-send for WHITING-MEAD'S Free 1915 catalog
showing how to save 20% to 40% on Building Material

Warner Fencing $4.10, $4.90, $5.55 per Roll, for Stock and Poultry

This class of fencing is known all over the country and usually sells for considerably more. First placed on the market some ten years ago to meet the demand for a substantial combination stock and poultry fencing.

It is closely woven and made of No. 14 galvanized wire, the spaces between the wires being graduated from the small mesh at bottom to keep chickens in, to the regular stock fence mesh at top. Has heavy cable edge at top and bottom, which enables it to withstand sudden shocks without injuring the fence.

Ten rods to roll and sold in full rolls only.

Height inches	Approx. Wt. per rod	Stays in ches	Bars number	Price per roll
35	7	6	15	$4.10
45	8	6	17	4.90
55	9.2	6	20	5.55

POULTRY FENCING $3.25, $3.60, $4.30, $ 4.90 PER ROLL—GRADUATED MESH—GALVANIZED

Has many advantages over the ordinary poultry n etting, being three times as strong, does not require a top or bottom board, as the selvege wire at top and bottom may be stretched to give perfect close fit to ground, and the top affords no place for chicken to rest.

All the features of the popular heavier fencing, including the interlocking mesh, with special graduated mesh to keep small chickens in. Sold in full rolls. 3 ft. high, $3.25; 4 ft. high, $3.60; 5 ft. high,$4.3 0, and 6 ft. high, $4.90.

WARNER HOG FENCING $5.00

Specially woven hog fencing, with barb wire selv ege at bottom, which effectually prevents hogs raising the fence, and does away with the necessity for and ex pense of bottom boards.

Made of best quality No. 14 galvanized wire, he ight 26 inches; weight per rod 4.5; stays, 6 inches; with 7 bars barbed at bottom. Sold in 20-rod rolls only, $5.

POULTRY NETTING 45c, 60c, $1.10
GALVANIZED—2 IN., 1½ IN., and 1 IN. MESH.

A great special buy, amounting to almost a full carload, in these much wanted sizes. Remember, it's all perfect in every way.

1 in. mesh, $1.10 per 100 sq. ft., 18, 24, 36 and 48 i nches high. 1½ in. mesh, 68c per 100 sq. ft., 24 inches high only. 2 in. mesh, 45c per 100 sq. ft., 18, 24, 36 and 72 inches high.

These prices will apply only so long as this lot remains in stock, so get your orders in early as they will be filled subject to stock on hand.

FENCE STRETCHER AND COMBINED HOIST $1.25

A most necessary tool in erecting wire fences and very handy to have on the farm at all times.

May be used as a lifting hoist, similar to block and tackle, has automatic catch which holds wire or load at height required. Thousands in successful use. Two sizes, $1.25 and $1.50 each.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	$1.15
2-ply, double-sanded, per roll of 108 square feet	$1.40
3-ply, double-sanded, per roll of 108 square feet	$1.65
1-ply "King" smooth, per roll of 108 square feet	$1.25
2-ply "King" smooth, per roll of 108 square feet	$1.50
3-ply, "King" smooth, per roll of 108 square feet	$1.75

Send for free sample. Remember we ship direct to you.

More and Better Hogs in California.

[Written for Pacific Rural Press.]

ALFALFA LEADERSHIP MEANS HOG LEADERSHIP.

Wherever agriculture is practiced in California, if the soil is a few feet deep and is not watersoaked for too long periods, alfalfa can be grown.

In sections of no irrigation, it may yield only one or two crops, but even these may be made to furnish succulence for hogs the year around. Geo. A. Smith of Corcoran makes good silage from the weedy early cuttings of his alfalfa, while the neighbors are vainly trying to cure their crops between rains. Though he has irrigation and other feeds when alfalfa isn't growing, he fills two 40-foot silos without even chopping it. The unchopped alfalfa does not spoil because two men tramp it down and its own weight in so tall a silo makes it settle well. So, in dry farming, to make alfalfa furnish succulence the year around, it is only necessary to plant a large enough acreage and then silo most of it.

Alfalfa from Start to Finish.—In irrigated sections, alfalfa forms a staple part of the ration from the time a pig is two weeks old until he goes to market. It is fed as pasture, soiling crop, hay, meal, and chopped alfalfa. It forms a valuable part of the ration wherever both hogs and alfalfa are grown; except where it forms the whole ration.

More stunted hoglets are produced on alfalfa than on any other one feed, because of the deceptive advertising of alfalfa as a complete ration, which it is not.

Animals must have certain amounts of several classes of feeds, two of which are most usually unbalanced, proteins and carbohydrates. Although, according to Woll's Handbook for Farmers and Dairymen, alfalfa furnishes a trifle over three times as much digestible carbohydrates as protein, there are still not enough carbohydrates to supply growing pigs, to say nothing of fattening hogs.

So if, as we have seen time and again, pigs are required to live on alfalfa alone, they eat all their pot-bellied sides can hold, in order to get enough carbohydrates. An excess of indigestible fiber fills them up too soon, so that after all they stunt because half-starved for carbohydrates.

Older hogs fed entirely on alfalfa do not have the ravenous growing appetite of a pig and also do not require so large an amount of carbohydrates per pound of hog, so they do not always get pot-bellied by eating too much, but they waste a large proportion of excess protein; and their rate of fattening is slowed down by the small total carbohydrates they can get in a day's eating of alfalfa. By the time they are big enough to fatten they are too old to be good eating, so they are retailed for less per pound than the Eastern pork; and the California prices to the growers are today based largely on the quality of similar old hogs.

Moreover, six weeks of grain feeding did not take the green taint from the flesh of an entirely alfalfa-grown hog observed by Chas. Goodman of Williams.

Alfalfa Balances Grain.—But alfalfa with a proper amount of feed high in carbohydrates (usually grain) is the basis of nearly all successful hog growing in California, and our "leadership in alfalfa" is one of the great reasons why our State should and may produce more pork than any other State in the Union.

CONQUER TRICKY HORSE.

To the Editor: I have read about Geo. E. Wright and his troubles with his saddle mare, and also the suggestions of two parties as to the best way of handling the animal, in the Rural Press of Oct. 2nd and Nov. 6th. I think all three of those men have a little more to learn about horse nature. A horse has more intelligence than he is generally credited with. What he learns once he never forgets, let it be good or bad. So the main thing in breaking a horse is to see that he learns good habits instead of bad. A horse can size up his master as to whether he is afraid or not and will act accordingly. If he thinks his master is afraid of him, the horse will have a new trick to perform every day. But if, on the other hand, he finds that his master is really master of the situation he will quail, and in the course of time will be good. What Mr. Wright wants is a good strong saddle and bridle, a heavy quirt and pair of spurs. With a piece of strong, small-sized rope, place a noose around the horse's nose tied with a bowline knot under the jaw, tieing the other end of the rope into a ring strapped to the center of the cinch. This will prevent the horse from going over backwards. Cinch the animal tight enough so that there is no danger of the saddle turning. Then get on without any preliminaries such as leading around, etc., and with the quirt and spurs get right down to business in true cowboy style. To the victor will belong the spoils. If Mr. Wright wins out, the horse will acknowledge its defeat by doing its work. May be a little sulky for awhile, but with kindness will develop into a good animal. By all means be kind to a conquered horse; don't abuse him because you can. If the horse wins out Mr. Wright should sell, because a horse that wins is dangerous until it meets its master.—A Lover of Horses, San Andreas.

SADDLE CINCHING: JERKIE.

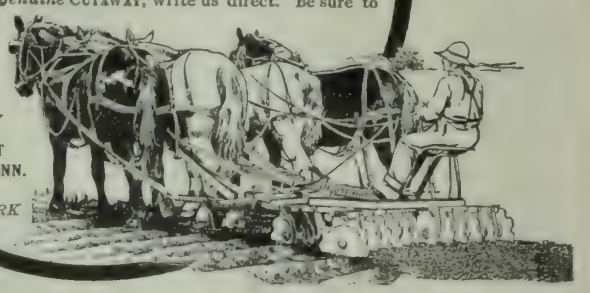
To the Editor: Some time ago you asked for a recipe for making jerkie. Cut the meat in thin narrow strips and dip in a strong brine of salt and water and hang out on a line in the sun to dry. A little pepper added to the brine helps to keep the flies off. One-fourth of a minute is long enough for the meat to be in the brine.

Another party wanted to know how to break his horse from pulling back and rearing up when he cinched the saddle on. He should put the saddle on and just tighten the cinch a little and then lead the horse around and tighten a little more, this way taking a little time and use a little headwork and treat the horse kindly. The trouble has been he cinched the horse too quickly and too tight all at once. E. W. Crow.

Crow's Landing.

Once Over!

Two diskings in one with a double-action harrow!



Cutaway (CLARK)

Disk Harrows and Plows

Save half the time and labor and have a better seedbed. Use a CUTAWAY (CLARK) Double Action Harrow. Its rigid main frame causes the rear disks to cut and turn all the land left by the fore disks—and with equal force. It will

Quickly Cut, Pulverize and Level

the toughest plowed land. The CUTAWAY disks are of cutlery steel *forged sharp*—and they penetrate deep without bringing up stones and trash. Dustproof, oil-soaked, hardwood bearings and perfect balance make light draft. Tongue truck not required—close hitch. Many CUTAWAY (CLARK) Harrows in use 25 years and still giving splendid service. There's a CUTAWAY for every need and a size for every requirement. If your dealer has not the *genuine* CUTAWAY, write us direct. Be sure to send for our new free book, "The Soil and Its Tillage." Plan now for better crops.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

Mutton Sheep on Small Farms.

[Written for Pacific Rural Press.]

ERRORS TO AVOID.

If sheep make money when allowed to run the year around on native grass pastures, with no other feed or shelter, and together with the bucks all the time, there ought to be money in taking care of them.

Walter Pitts of Butte county has 60 to 100 sheep which have the run of about 60 acres of natural grass, with no other provision for their care. He sheared 48 year-staple fleeces last fall and sold them for $73.50. He gets 8 to 9 pounds of clean wool per old sheep. He also sold 35 or 40 to the butcher this season weighing about 100 pounds. The butcher comes weekly for a few at a time.

From experience, Mr. Pitts speaks of several things for sheep growers to watch.

The greatest loss is where young ewes have twins and walk off with one while the other is asleep or playing. Old ewes are more careful, often noticeably watching both of their lambs. Sometimes when lambs come in early winter or in summer, there is not enough feed to keep up the milk, and one or both lambs are lost.

Some of the lambs came this year in early December. These are the most profitable if they live through, because they mature sometimes in May, ahead of the rush of lambs from range flocks. Summer lambs also mature at an odd season of high prices.

If it storms during the first three or four days after a lamb is born, it is taken to shelter—after four days it stands winter rain pretty well. Most of the rains in Mr. Pitts' country come at a temperature of 50 to 60 degrees. Cold prolonged rains do more damage.

Watch for Maggots.—It is a vital need when warm spring showers alternate with sunshine, to watch for the big green "blowflies." If sheep are restless, lie down often, and repeatedly nip themselves, principally between the hind quarters, the fly maggots are probably burrowing into the flesh. This part is then sheared close as possible and swabbed with diluted sheep dip, scraping off the maggots as they work out of their burrows. Mr. Pitts thinks he killed a lamb or two one time by using turpentine too strong for this purpose; but with the sheep dip treatment, hasn't hurt them and hasn't lost any with maggots for two years.

Foxtail dries up along in May, and then the little lambs very often get some in their eyes, which would be blinded if untreated. Mr. Pitts shears them close all around the jaws, eyes, and ears, and then if any get the foxtail in their eyes, he lifts the lids and pulls the spears out. Sheep are not bothered, and lambs are not except three or four weeks while it stands up dry.

TESTING CREAM WITHOUT SCALES.

To the Editor: Is it possible to test cream correctly without weighing it? The scales that are sold for that purpose are so expensive. Can any other kind be used?—W. B. B., Modesto.

[To be exact in cream testing it is necessary to have a set of scales accurate and sensitive to at least one-tenth gram. This is necessary, as cream varies in weight with its richness and mechanical condition and no one measure will hold the absolutely correct amount of cream of varying richness.

As sensiitve scales are usually lacking on the average dairy and as maximum accuracy is not so essential, the cream may be measured into the test bottle with a 9 cubic centimeter pipette, instead of being weighed. In this case the pipette should be rinsed out twice with warm water and the rinsings transferred to the test bottle; otherwise the test will be too low.

When cream is measured into the test bottles, care should be taken that it is not permeated with foam. Freshly separated cream contains considerable foam, and if the measuring is deferred for at least half an hour, the air has a chance to escape. A reasonably accurate test can then be secured by again stirring the cream before sampling. It should be understood, however, that tests made by measuring cream are only approximate and are not entirely comparable with the more accurate weighing of the cream, as practiced in the creamery.—Editors.]

ADVANCE OF THE SILO AT THE EAST.

The silo becomes more important each year as a means of utilizing the corn crop, says the Rural New Yorker and gives these figures for it: Five years ago only 3½ per cent of the total crop went into the silo, and 11 per cent in addition was cut and fed green. In many of the States less than half the corn is left to mature grain. See what the silo has accomplished in the following named States:

	Percentage of Crop. Cut for silo	Cut for green feed.
Maine	35	15
New Hampshire	65	6
Vermont	74	5
Massachusetts	58	10
Connecticut	55	3
New York	49	9
Wisconsin	36	18
Michigan	28	13

Last year the corn grown on 8,364,000 acres was put into silos. This year there is probably a gain of 1,000,000 acres. We see that through New England and New York less than half the corn is matured for grain. Even in States like Illinois and Indiana about one-fourth of the great crop is fed green or put into the silo. There is only one way to look at these figures. They show that the silo is gaining in popularity, as year after year the great value of silage is demonstrated. Where corn brings the highest price there the largest proportion of the crop goes into the silo. As the cultivation of alfalfa spreads through the East there will be more silos. Alfalfa fits the land for more corn, and good silage and alfalfa hay are pretty close to a full balanced ration.

England has ordered $4,866,500 worth of cheese from New Zealand for the Army. This is about 1-5 of the Dominion's production. The price is 14 cents per pound.

Productive Feeding OF Farm Animals

F. W. WOLL, PH.D

Professor of Animal Nutrition, University of California.

FIRST EDITION—1915

860 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

DAIRYING.

A new dairy barn is being constructed on the H. H. Coke ranch near Paige, Tulare county.

Dolcini Bros. of Petaluma have recently purchased eight Holstein cows and a purebred bull in Fresno and Kings county.

M. T. Machado, a dairyman near Gridley, reports satisfactory milk yields from his cows since he began feeding beet pulp and barley.

More than a ton of butter a day is being turned out by the two cream eries at Orland, which indicates that the dairy cow is gaining in numbers there.

The Pacific Coast Condensed Milk Co. have contracted with France and England for their supply of condensed milk during the next two months.

David Salfield has purchased a 100-acre ranch in the Escalon district of San Joaquin county and will establish a herd of purebred Holsteins. He expects to build modern buildings.

A creameryman at Willows has recently been fined $25 for giving a false cream test to one of his patrons. The complaint was made by J. H. Severin, State Dairy Inspector for that territory.

The directors of the Fountain City Creamery at Merced have decided to increase the capital stock of the concern from $6,000 to $30,000 and to change the name to the Merced Creamery.

Wm. J. Heil of Santa Ana has purchased the Guernsey bull Soledad Buttercup from E. R. Frey of Byron, Contra Costa county. Mr. Heil also purchased a Guernsey bull from the Dr. Henderson herd.

The Humboldt Dairymen's Ass'n will hold a meeting January 11, at which time plans will be gone over for the entertaining of the California Creamery Operators Ass'n which is to hold its annual convention this year at Ferndale.

Fred W. Kiesel of Sacramento has purchased 28 head of registered Holsteins in New York. Dr. E. J. Weldon did the buying for him. They will be placed on the Keisel ranch near Sacramento where there is already a good-sized herd of Holsteins.

From January 10 to 15, Dr. Haring, professor of veterinary science of the University of California, will visit dairy farms and deliver talks to the Farm Bureaus of Stanislaus county on the control of contagious abortion and tuberculosis.

According to reports from Vina, Tehama county, 6,000 acres of the Stanford University Farm at that place will be cut up into 100 dairy farms and leased to dairymen. This land will all be seeded to alfalfa and we understand one or two tenants are already on the ground.

The leading cow in the Tulare Cow Testing Ass'n for the month of November was a registered Jersey owned by Chas. McFarland which gave 990 pounds of milk containing 58.7 pounds of fat. There were 12 cows in the association which produced over 45 pounds of fat during the month.

Sidgley Wilson of Phoenix, Arizona, shipped 120 head of grade Holsteins from Modesto last week to supply the demand for dairy cows in the Southwest. He also shipped three registered Holstein bulls. He has shipped several carloads of dairy cattle from Stanislaus county to Arizona points before.

We are in receipt of the annual report of the San Francisco Wholesale Dairy Produce Exchange which shows that there was a gain in the receipts of butter at San Francisco of 5,868,850 pounds during 1915 over the year 1914. There was also an increase of 1,228,600 pounds of cheese during that time. The average price of butter during the year was 26.29 cents per pound and the average of cheese 13.28 cents per pound. The total receipts of butter during the year were 28,349,400 pounds, and of cheese 11,117,900 pounds. These figures include interstate and foreign importations.

In feeding his registered Holsteins, H. E. Cornwell of Stanislaus county feeds 25 pounds of alfalfa hay and two pounds of the following mixture, varied of course according to the judgment of the feeder: 1 part rolled barley, 1 part cocoanut meal, ½ part molasses and ½ part dried beet pulp. Besides this the cows are allowed to pasture a short time daily. The 30 head, 10 of which are strippers and 13 with their first calves, are averaging three gallons of milk daily on the above ration.

SWINE.

Two carloads of hogs were shipped to San Francisco last week from McFarland and one from Tulare by Belknap and Thompson.

A. N. Scott of Upper Lake made a large shipment of hogs to the San Francisco market last week. The hogs were said to be in fine condition.

U. Hartman of Manteca has lately shipped two registered Berkshires to Fallon, Nevada, and also sold a young boar to Hans Stolzel of San Joaquin county.

Judge W. T. S. Harding of Eureka, Humboldt county, is said to be establishing a large herd of Duroc-Jersey hogs on his ranch in southern Humboldt county.

W. M. Mikesell of Manteca believes in breeding for the long roomy type of hog as the sows are capable of raising more pigs. He now has 30 head of registered Berkshires on the ranch.

Two carloads of hogs were shipped from Chowchilla last week and with the shipment of two more cars which are about ready for market the supply of porkers there will be about cleaned up for the time being.

Fred Treat of San Lucas, Monterey county, reports that he has had fine success with white clover, having cut three crops of hay without irrigation from a 38-acre field and also pasturing a large herd of hogs on the same field.

J. L. Thatcher of Riverside county reports that he has just returned from a trip east where he purchased a carload of registered Berkshires that will be brought out just as soon as State Veterinarian Keane will permit shipments from all parts of Iowa.

J. E. Thorpe of Stockton has recently formed a partnership with H. J. Colberge of Stockton and will branch out materially in the raising of purebred Duroc-Jersey swine. The new firm has near completion a hog barn 26x40 feet, with a driveway down the center and loft for grain overhead. Mr. Thorpe will act as manager of the new concern.

M. Bassett of Kings county has received a $5 prize from the Chicago Livestock World, which was awarded him on the recommendation of J. M. Kemp, who stated that the Poland-China boar Banker's Boy, shown at the P. P. I. E., was the best boar of the breed he had judged in 1915. As a result of a fight with another boar Mr. Bassett's boar Hustler's Model was killed last week.

We are advised by F. E. Newton of Hanford, Kings county, that the Kings County Poland-China Breeders' Ass'n will sell 150 head of registered hogs at their sale February 5. He further states that every preparation is being made for the sale so that all who attend will be well entertained whether they buy or not. Kings county has an enviable reputation for fine Poland-China hogs and buyers should find a choice lot at their disposal in this sale.

SHEEP.

Stockmen of Nye county, Nevada, are determined not to allow sheep into their county from Elko county which are known to be afflicted with rabies. Deputies have been appointed whose duties it will be to turn back all bands trying to enter the county.

Several large sheep sheds have just been completed on the Stanford University's ranch at Vina, Tehama county.

Bert Vosper and Ben Marcus have entered the goat business near Sonora, Tuolumne county, where they have erected suitable buildings and now have 450 Angora goats.

BEEF CATTLE.

Complaint of incompetent inspectors, both federal and state, was made last week at Chicago before the United States Senate committee which is investigating the recent foot and mouth disease outbreak in eastern States.

Nevada, California and Utah are to make a united stand against

When Grain is High **Feed DIGESTER TANKAGE**
Whether intended for show or market, the hog attains perfect condition and more quickly and economically if his ration includes some DIGESTER TANKAGE. The growing pigs need DIGESTER TANKAGE as a bone and muscle builder. Write for free pamphlet on hog-feeding.
WESTERN MEAT COMPANY,
Animal Food Dept., 704 Townsend St., San Francisco, Cal.

coyotes in order to check a more general spread of rabies in the three States. Sheepmen in Nevada report the loss of 25,000 sheep during the past few months from this source.

In a letter from O. M. Plummer, general manager of the Pacific International Livestock Exposition at Portland, Oregon, he states that there were 50,000 people in attendance at last year's show and that the dates for this year will be December 4 to 9.

The Porterville Alfalfa Co. of Tulare county is one of the few concerns which has been able to profitably finish range cattle on alfalfa. This company has just marketed two fat steers, the natives averaging 1200 pounds, and still have 275 head in the feed lots.

According to advices from Los Banos, Miller and Lux have had exceptionally good results in feeding their beef steers a ration composed of chopped alfalfa, barley and molasses, during the past months. The mixing is done by machinery and the company is said to have spent approximately $75,000 equipping its different ranches to handle the feed.

HORSES.

The Blackhawk Ranch of Burlingame reports having sold to a company located at Carson, Nevada, the Shire stallion Lucky Boy, a two-year-old California raised animal. They have also sold the imported horse, Anwick Arthur, to a company at Salinas, and Black Hawk Minstrel, a California raised horse, to the Danberg Co. of Minden, Nevada.

According to dispatches from the east, the Board of Health of New York will permit the sale of horse meat in New York City from this time on. The report states that hereafter old horses will be fattened and sold for meat instead of being sold for their bones. It is doubtful whether this ruling will materially reduce the cost of living of New Yorkers.

PAYING MORE FOR GOOD CREAM.

[Written for Pacific Rural Press.]

Cream grading in some form is being practiced by practically all of the creameries purchasing cream in the portion of Stanislaus county east of the Stanislaus river.

The Modesto creamery, which is the largest buyer of fat in the county, started the movement November 1, when they established a ruling that they would pay four cents above the San Francisco butter quotation for cream testing over 33 per cent fat and three cents over for cream testing under 33 per cent. This ruling has not only made a vast improvement in the quality of the cream but is highly satisfying to dairymen, as they have more skim milk for their hogs with a high testing cream and the additional cent a pound runs into money in a month's time.

Other creameries in the locality are buying on the same principle, only one exception being reported.

COMING AUCTION SALES.

California Swine Breeders' Consignment Sale, State Fair Grounds, Sacramento, January 27, 1916.

First Annual Sale of Kings County Poland-China Breeders' Ass'n, Fair Grounds, Hanford, February 5.

Second Annual Consignment Sale of California Draft Horse Breeders' Ass'n, University Farm, Davis, February 2.

LIVESTOCK DIRECTORY.

Care Hotel Clark.

28.9 lb. Holstein Bull 14 Months Old $500

His Dam, Korndyke Ormsby 2nd, as a 5-year-old, made in 7 days 28.91 lbs. butter fat, test 4.26. His Dam's Dam, Korndyke Ormsby Hengerveld, has a 26.74-lb. record and three A. R. O. daughters. In his sire he combined the blood of Creamelle Vale, second only in milk production to Tilly Alcartra, official record 1155.85 lbs. of butter from 29,591.7 lbs. milk, and the great sires Dutchland Sir Peiterje Hengerveld, who has 15 A. R. O. daughters; Pieterje Hengerveld Count De Kol with 49 A. R. O. daughters and Pontiac Butter Boy, one of the real great sires of the breed.

The Bull is a dandy, straight, nicely marked, being half white. He is just what you are looking for and is worth twice what I am asking.

Write, or better, come and see him.

F. H. STENZEL, San Lorenzo, Cal.

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

FROSTED ALFALFA DANGEROUS.

To the Editor: Frost came in early November this season and cooked the top growth of alfalfa till the fields were brown on top, though nice and green underneath. The cows seemed to eat the frosted ends first and enjoyed them; would clean off the tops before they would go down after the green alfalfa and barley sown in the early fall for the winter feed. At first we noticed that some of the cows scoured badly and would grunt as if in colic. In most cases it passed off; but one cow that was to freshen in about a month would strain and lie around; and finally died. We cut her open and the calf was dead and had been apparently for some time. In a few weeks a change to another field, and a cow with her second calf had the scours and aborted a seven months calf; is doing well now. An old cow probably about the sixth calf aborted at six months, looks rather ornery but is eating well. Heifer to have second calf, full time but calf came dead. Can not tell if it was from frosted alfalfa or not. The calf had appearance of being choked in delivery. Frosted alfalfa is something new to us; it may have happened before, but we have never noticed it. Nothing else in the field that we can think of that might give us the trouble. They have an abundance of hay and plenty of pumped water; are dehorned and handled carefully. Other fellows that are having the same trouble, tell me that when they have lost cows they cut them open and found the stomach packed full of the offending alfalfa. We have had no rains or exceptional cold to start anything from exposure. — G. A. A., Glendale, Ariz.

[Your trouble is undoubtedly due to the eating of frosted alfalfa. Frozen foods of all kinds decompose rapidly, and are not fit for consumption either by humans or our domestic animals. Two pound doses of Epsom salts dissolved in water would be of great benefit to affected animals. Your surest cure is prevention by discontinuing the use of such pastures as you describe.]

WILD COW.

To the Editor: My cow, 4 years old, has had two calves, is awful wild, acts like a broncho. I tied her up but she went through the fence, broke the posts, and cut the hind part of her bag so she could hardly walk. Now that she has recovered, I have to rope her again. When a stranger comes she gets nervous and excited, and hikes. She gives good, rich milk. Sometimes I had a notion already to try a shotgun on her. J. P. G., Dinuba.

[The shotgun treatment will probably be the best.]

COW'S SKIN CRACKLES.

To the Editor: I gave a young cow Epsom salts and raw linseed oil for indigestion. Some of the oil went into her lungs and almost strangled her to death. She seems to have most of the oil out of her lungs and has a good appetite. But there seems to be air under her hide. In passing the hand over her body, it sounds like crumpled paper. Across her back just in front of her hips is a place as large as a wash basin puffed up about two inches.—A. C. N., Edenvale.

[This is Thurlow's Disease and is due to digestive disturbances. Give fluid extract of nux vomica in one-dram doses twice a day.]

HORSE HAS BAD BLOOD.

To the Editor: My horse, 12 years old, is doing very poorly of late. He has a good appetite but don't seem to digest well and has bad spells of scouring at times. I thought his teeth had something to do with it and had the dentist file them down good, which I think did some good. Blood seems to be very bad as any little scratch or sore, which is easily made where hames or halter touches, festers and runs badly, and is hard to heal up. Urine is very thick. He drinks as much water as two ordinary horses should. He has the best of feed, good alfalfa with rolled barley and Egyptian corn. He is a free worker and a fine traveler, but his feed don't seem to hold out between feeds while working.—F. E. D., Escalon.

[Have this animal tested for glanders. If animal does not react, put it on Fowler's solution of Arsenic, ½ oz. three times a day.]

SICKENS AFTER FARROWING DEAD PIGS.

To the Editor: A brood sow 3 years old was vaccinated 2 months after being bred. She farrowed Sept. 15, five pigs in all stages of development and decomposition, and two alive. These two she refused to nurse; would allow me to handle or milk her at will. It was necessary to dry her up at once. She seemed normal until Nov. 30 when she was bred again. The morning after breeding she seemed to have lost all control of her front legs, turning her head 45 degrees to the right, staggering, and falling repeatedly. This seemed to partially pass away after 5 or 6 days and she came back to normal feed. Twenty-one days after breeding, a more severe attack came on, from which she does not seem to be able to recover. She is unable to get on her feet and refuses to eat, without drenching. The right side of the head and body half way to the flank seems very sensitive, though there is no swelling or discharge from the ear but a slight discharge from the snout which does not look like pus. Temperature is normal, but the muscles of the ear are relaxed. She has never been roughly treated and we have no foxtail. The application of cold mud behind the ear seems to relieve her. The eyes roll, but she sees and hears well and is gentle.—H. S., Woodland.

[This is a form of poisoning due to the absorption of the putrid products caused by the decomposition of the foetus. Treatment at this late date will probably fail. Try hot douches of 1-1000 Chinosol solution three or four times a day. Give internally 30 grains potassium iodide three times a day in 1 oz. water, also 20 grains hexamethylamine in water twice a day between the other three doses.]

CALF CONVULSIONS.

To the Editor: I read in your issue of Nov. 27 of "Convulsions in Healthy Calf" from H. T., Stockton. "Two handfuls of oil cake meal"—at a feed? H. T. did not say a day or a month, so I presume at a feed. Milk—protein. Oil cake meal—protein. Rather dangerous feed, is it not?

I will cite an experience I once had that cost me three purebred calves. I began feeding one teaspoonful of oil cake meal with each milk ration. The calves were doing nicely so I had it increased to two, then to two heaping tablespoonfuls.

All of a sudden something happened to one calf. I will not rescribe the symptoms; you can refer to H. T.'s question—they are identical. I took for granted that poison had entered the system by some unknown way. In several days another went by the same symptoms. I immediately looked for a cause. I changed the quarters, feed, etc., but another died the same day.

Post-mortem was held over both bodies and the same lesions found in both. They were in the kidneys. I took the matter up with several authorities but they gave me no satisfactory answer. A suggestion from one was that I should look for something that would stimulate the kidney almost to congestion. I then concluded at the time that the skim-milk which is high in protein and oil cake meal which is high in protein caused the kidneys (which break down and carry off all protein substances) to congest, caused convulsions, and death. I afterward proved this beyond doubt.

Have you considered that taking fat out of milk does not lower the protein content? Then why do you give "two handfuls of oil cake meal?" I know from feeding experience that ground corn or ground barley will better supplement a milk ration. Give all of this corn or barley ration that a calf will readily clean up.

If you have trouble to start the youngsters eating grain at first, throw a handful in the milk bucket just before they have drank the last pint. One lesson is sufficient.—H. I. B., Fallon.

[What you have written is to the point and correct. A wandering foreign body would, however, give symptoms of a very similar nature, and a positive diagnosis would be possible only on autopsy.]

COWS CALVE PREMATURELY.

To the Editor: I am having trouble with cows losing their calves, at about the fifth or seventh month. After losing the calf, they usually have a white discharge, come in heat regularly but fail to get with calf. Have lost about 10 calves out of a herd of 30 cows. Is this a disease? If so can it be cured, and how, and what effect does it have on the bull running with these cows?—A. B., Visalia.

[This in infectious abortion. Refer to the article on this trouble in the January 9, 1915, issue of this paper.]

HEIFERS DO NOT BREED.

To the Editor: Three of my heifers do not get with calf though they have every opportunity, and I know the bull is all right.—F. M. B., Delevan.

[Dilate the mouth of the uterus just previous to breeding. An experienced veterinarian should do this.]

CALF DOESN'T GAIN.

To the Editor: A calf 1½ years old has had diarrhoea for a year and is in poor condition. I had her on the best alfalfa, but she did not improve, so I tried her on dry feed, but still no improvement.—Sub., Greenfield.

[Have this calf tested for tuberculosis by a qualified veterinarian.]

WARTS ON TEATS.

To the Editor: Warts are gradually spreading to all the teats of my young cow.—H. N. H., Sanger.

[Paint the warts twice daily with a 3 per cent solution of Chromic acid in water. They will disappear in two or three weeks.]

SINGEING RATS DIDN'T WORK.

To the Editor: I saw in the Press of November 20 that one reader advises to singe one or more and turn them loose. I tried that about 25 years ago, but I suppose the rats are about the same now. I singed him and cut his tail off, and turned him loose. In about a month I caught the same old fellow; that time I did not singe him but cut his tail off just back of his ears. That was the last of that one. No rats have left on account of that one being singed.—E. L., Winton.

Baby Beef and Hogs on Alfalfa.

How a Solano County farmer is beating the hay game by walking his crops to market.

Because he couldn't depend upon the hay market, P. B. Grieve of Solano county decided about two years ago to attempt feeding his hay to beef cattle and hogs. During that two years he has satisfied himself that he has hay-selling beat a city block. He still has theories to be worked out in practice, but his system (while simple) is so suggestive of what is possible in many similar locations, that his past experience is well worth the consideration of alfalfa growers.

Like others with hay but no livestock, Mr. Grieve felt the shoe pinch about two years ago. He was farming 50 acres of irrigated alfalfa. Close to him was grain land which could be rented. About 15 miles away was good grazing land in the foothills of Yolo and Solano counties, which could be rented, and about six miles in another direction was land that overflows in the winter and furnishes good summer pasture.

What Mr. Grieve has done is to take advantage of these various factors, fitting each one into its proper groove, with the aim in view of furnishing a continuous supply of excellent feed for beef cattle and hogs.

The mountain range land is best after the beginning of the winter rains when the lower lands become too muddy for cattle. Late or early rains are the deciding factors as to when the cattle are taken to the mountains. Usually about the middle of May these pastures have begun to dry up. These ripe, wild grasses are noted for their value in finishing cattle for the market and as such are used to excellent advantage by Mr. Grieve. By pasturing outside cattle, 3000 acres of this range is rented, the average cost being about 45 cents a month per head. Being fenced and well watered, all labor cost is eliminated, one visit a week being all that is necessary.

From the middle of May till the middle of September, the cattle are pastured on the overflow land. This year 240 acres of such land were rented for $200 and supplied feed for 135 head for the four summer months. This lowland pasture gives the calves which have been dropped in March an exceptionally good start; but by the middle of September it is again necessary to seek new pastures.

By this time the last cutting of alfalfa has been harvested and after irrigating once more, the cattle are turned onto the alfalfa fields and grain stubble. "This," to quote Mr. Grieve, "cleans up the ranch and at the same time puts the cattle in fine condition." The weanlings are now fed alfalfa hay, also the older stock when necessary, and pushed along at a rapid rate. So far there have not been enough cattle and hogs to consume all of the hay grown, but this will be overcome by additional stock in the future. With the start of heavy rains, the alfalfa land becomes too muddy for cattle, so they are taken to the fresh, green grass on the mountain range. Intermingled with the fresh, young grass is the previous year's ripe grass and it is this factor that holds out most hope for the production of baby beef: the ideal so many are striving for.

With highly bred Hereford cows, purebred Shorthorn bulls, and an almost continuous crop of succulent green feed, Mr. Grieve believes he can profitably market long yearlings by having this old ripe grass for finishing purposes. This system will put them on the market sometime in December. An exceptionally good long yearling was turned off in this manner last year, bringing $41.50 from the local butcher. In another year the feasibility of this on a larger scale will be definitely known.

Hogs play no small part in the annual profits of the system, in fact the hogs are a mighty important part Ten brood sows are kept and a registered Berkshire boar used. Two litters a year are farrowed, one in the spring after the heavy rains and one in October. Alfalfa pasture is the chief reliance for feed most of the year, the spring litters being grown on it till after grain harvesting, after which the hogs are finished on the grain stubble. On 200 acres of grain land, Mr. Grieve figures there is ordinarily 1000 sacks of grain which the harvester doesn't get. With hogs on this stubble there is little if any wasted, and it makes fine pork. The fall litters are carried on alfalfa pasture also, being finished on soaked barley in the spring. All of the hogs receive some barley along with the alfalfa pasture at all times. This keeps them thrifty and puts on weight faster. When sold, the pigs weigh between 125 and 150 pounds.

Disease has not so far been a factor. This is accounted for by Mr. Grieve by cleanliness. No wallows are provided, and as the ranch has its own pumping plant there is no chance of cholera being carried onto the ranch in irrigating ditches. Fences are kept up in good shape, crude oil rubbing posts used for lice, and salt and charcoal for worms. At the time of our visit in September, the spring pig crop was ready for market, worth right around $600. Two such crops a year are not to be sneezed at as a side issue.

When he enlarges his herds of livestock, Mr. Grieve expects to walk all of his feed to market. "You came about a year too soon for definite figures," he said, "but I'm satisfied my plan beats hay selling." It would seem that most any alfalfa grower adjacent to a foothill district could profit by a similar plan to the one being used by Mr. Grieve.

WHY NOT ANGUS CATTLE?

To the Editor: What is the reason that more Aberdeen Angus cattle are not raised in this State? Is there some cause that makes them unpopular?—H. I. B., Fallon.

[The Angus cross on grade Durham cows was tried out many years ago by pioneer cattle breeders and produced most satisfactory animals, but were not entirely satisfactory for range purposes. The calf crop was always short and they showed a tendency to become unduly wild in rough sections. They undoubtedly merit more general use than they are put to in this State at present and perhaps this will come when more beef cattle are raised on the farms of the State. They are ideally suited for the production of "light cattle," which for most markets are always in demand.—Editors.]

SHEEP GID PARASITE CARRIED BY CARRION-EATING DOGS.

[From U. S. Dept. Agr.]

The parasite which causes gid in sheep somewhat resembles the hydatid worm. A dog allowed to eat the brain of a giddy sheep may swallow this parasite and later distribute the eggs of the resulting tapeworm over the pasture. Sheep while grazing swallow the eggs with the grass which they eat. In the case of sheep dogs it is important to administer vermifuges often enough to keep them free of these worms. In the case of sheep measles, the bladder worm in the meat, typical of this disease, is swallowed by the dog and again the tapeworm eggs are passed by the dog to grass or water, and there are eaten by sheep.

DOGS CARRY DISEASE.

[From U. S. Dept. Agr.]

Hydatid disease is caused by the presence in the liver, kidneys, brain, lungs, and other organs, of a bladder worm or larval tapeworm. Bladder worms are often as large as an orange and may be larger. A dog which is allowed to feed on carrion or the raw viscera of slaughtered animals may eat all or part of a bladder worm containing numerous tapeworm heads. These tapeworm heads develop into small segmented tapeworms in the intestines of the dog. The tapeworms in turn develop eggs which are passed out in the excrement of the dog. They are spread broadcast on grass and in drinking water where animals can very well eat them and thus become infected. The hog is particularly liable to this disease because of its rooting habits. The eggs may get into human food, and persons who allow dogs to lick their hands and face also run the risk of getting the eggs of the tapeworm in their systems.

Prevention on the farm consists in so restraining the dog that he can not get at carrion or raw viscera. Viscera should be boiled before being fed to dogs and should never be thrown on the fields. If not cooked and fed, viscera and carcasses should be burned, buried with lime, or so disposed of as not to be accessible to dogs. Proper feeding of the dog is essential, and the owner who does not feed a dog properly has no right to keep one.

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

SOFT-SHELLED EGGS AND FEATHER-EATING REMEDIED.

To the Editor: What causes my chickens to pull feathers from one another and eat them? Also, what can I feed to lessen the number of soft-shelled eggs? I feed wheat and rolled barley and they have access to dry bran, meat scraps, milk, broken oyster shells and grit. Would like to know the proper way to mix feed to get best results.—Mrs. C., Sacramento.

[Feather pulling is almost always caused by idleness. Make the fowls work hard by scratching for their grain in deep litter and they will not have time to get into mischief. Apply vaseline to the bare spots; this will help a new growth and at the same time discourage any pecking at the new pin feathers. When hens lay soft-shelled eggs while supplied with broken shells the trouble is due to intestinal fat which interferes with proper formation of the egg shell. Our enquirer does not say what proportions of wheat, rolled barley, etc., is fed, but it is evident that too much of these grains are consumed by these fowls in proportion to the bran and meat scrap. The grains furnish most of the materials that produce yolk material, fat, heat, and energy; while the bran and meat contain an excess of the material that makes the white of the egg as well as muscle, frame, feathers, etc. In order to produce eggs in abundance, particularly in fall and winter, it is necessary to feed a ration balanced for egg production. There are hundreds of combinations of grains, meals and greens that may be used to make up a correctly balanced ration. We gave some exact figures in articles that appeared in issues of August 21 and 28 and September 4 and 25, but if it is not possible to carefully carry out the plans suggested in these articles the following rule will help to get somewhere near the proper proportions for egg production: Feed all the variety you can of grains and seeds in litter to induce exercise and prevent gorging, and as many sorts of meals, including brans or shorts, in the mash as it is possible to obtain. Do not omit meat, bone, and green stuff; grit shell and charcoal should be within reach of the fowls always. The feeds used by many of our most successful poultry keepers contain 20 to 40 different materials, even when great care is exercised to produce a ration exactly balanced for egg production.]

MILK WILL NOT CURDLE.

To the Editor: Kindly print some advice about clabbering milk for poultry. Sweet milk direct from the separator seemed to cause sickness and when kept until sour it had a still worse effect. Do you know of some article that can be added to the sweet milk that will turn it to clabber and at the same time not be injurious to the fowls?—F. P. Willows.

[Rennet in the form of tablets, powder, or liquid with directions for use in curdling milk, is obtainable at many drug stores. The failure of milk to curdle or clabber is due to several causes, among which the following are most common: Natural lack of sufficient lactic acid or the presence of foreign substances that prevent proper action of the acid—milk and vessels must be very clean; sometimes a rusty seam in a milk pail or can will prevent proper action. At times it may be due to failure to remove the animal heat from the milk, which results in what is known as a sweet curd which is very likely to be injurious to health. In our opinion the only thoroughly safe way to feed milk is in the form of cottage cheese with the whey removed and thrown away or fed to pigs. We have never experienced any difficulty in getting prompt results when using the following method: Cool milk to about 50 degrees, then heat to about 90 degrees, leaving it at that temperature for two or three hours, after which set it aside and let nature take its course. We had this advantage, however: the milk was produced and handled under the supervision of an inspector. Not all country folks are careful enough in handling milk—they do too many things by guess.]

TICKS INJURE HENS.

To the Editor: I send you some sort of poultry vermin. Just today I found these hid in cracks and between boards. My fowls have not done well this winter, but I have never been able to find any of these bugs on the hens. Tell me what they are, and how to get rid of them. —J. S., Dinuba.

[These are poultry ticks and to get rid of them requires careful and patient effort. The Pacific Rural Press published items regarding these ticks in the issues of Oct. 16 and Nov. 13, 1915. We also advise sending to the Department of Agriculture, Washington, D. C., for circular No. 170, which contains many suggestions and plans for exterminating these vermin and to prevent their infesting poultry houses. It is sent free on request.]

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

The Fontana Poultry Association has been incorporated at Fontana in San Bernardino county.

The poultry keepers of Hessel held a New Year social in the Hessel club house on Friday evening, Dec. 31.

The monthly meeting of the Sonoma County Fanciers' Club was held in the Chamber of Commerce room, county court house, Santa Rosa, on Monday evening, January 3. A. B. Foote is secretary.

As a result of his exhibit in the Panama-Pacific Poultry Show, J. V. McConnell of Garden Grove has booked an order for a Black Minorca cockerel for shipment to the South Sea Islands.

The Cornish fowl, formerly misnamed Cornish Indian Game, is regaining its former popularity. The American Cornish Club now boasts a membership of 336. The annual meetings was held at the Panama Pacific Poultry Show in November.

The Wilson district, near Petaluma, held its Christmas social in the school house during the evening of December 22nd, in connection with an enjoyable entertainment by the pupils of the school under the management of the principal and teachers.

As high as 17 cents live weight was paid in December to turkey growers at Brawley. When the Imperial Valley farmer gets that figure in cash for his turks, including feathers and more or less feed in their crops, he entertains a kindly feeling toward all mankind, including the middleman.

In connection with the effort to make self-supporting all the State institutions, the State Board of Control plans to have the various State hospitals produce the fowls and eggs required by them in caring for their patients. Several of the institutions have in the past and are now producing at least a portion of their own supply, while the others, which have no flocks of fowls, draw large sums of money from the treasury to pay for the necessary supply.

M. S. Woodhams of San Mateo reports that his flock of Buttercups now number over one hundred fowls. They were named Buttercups because of their cup-shaped combs. The males are orange red, while the females are a deep buff with dark spangles. No special mating is necessary to produce the difference colors in the males and females. The eggs are white and a trifle larger than those produced by the Leghorns.

The poultry industry in Missouri is growing faster than any other branch of agriculture at present, for people are beginning to realize that the revenue from poultry and eggs during the two years of drouth has been a great help in paying the grocery and clothing bills, and in a majority of cases has also helped to increase the bank deposit. Much encouragement and assistance has also been given the farmers by the Mis-

California Poultry Practice

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

HOPLAND STOCK FARM

HOPLAND, CAL.

Standard Bred S. C. White Leghorn Cockerels, selected for Breeders. Four months old, 12 per dozen; Yearling Hens, $12 per dozen. Standard Bred White Plymouth Rock, Fishel and Owen Farm Strains Direct. Hens one and two years old $18 to $24 per dozen. Four to five months' old pullets, $18 per dozen. Selected Cockerels and Cock Birds, $5 each and up.

souri State Poultry Association, which has a membership of nearly 5,000 active poultry breeders.

CHICKENS MOLT OFTEN.

To the Editor: Will you please tell us what makes spring chickens molt two or three times during the season? They are fed a mash in the morning, made of bran, middlings, or shorts, cocoanut meal, and once a week fish meal, mixed with the rest of the mash. This is all mixed with the scraps from the kitchen and potato peelings cooked. At night we feed wheat. Four or five times a week they have sour milk. They have big range.—A subscriber, Oakley.

[Answered by Geo. H. Croley.]

[It is natural and beneficial for chickens to molt several times while growing from chickhood to about the age of laying, but no doubt our enquirer refers to one or two unwelcome molts, or partial molts, that occurred late in the fall when eggs were due, but failed to materialize. An oversupply of fats or oils, particularly vegetable oils, is the most common cause of unseasonable or repeated moltings. The cocoanut may have been fed too liberally. See an article in September 25 issue in regard to feeding this material. The kitchen scraps may have added some fat. It is stated that the fowls have a big range. This range may have supplied an abundance of oily seeds, large quantities of which would have been eaten by the fowls. The fish meal, if very oily, will also add to the supply of excess fat. The most valuable fish meals seem quite dry and not nearly as nice to look at as the poorer grades that have a fresh, attractive appearance, but which are sometimes so oily that the oil may be squeezed out by pressing it tightly in the hand.]

Farm Poultry for Profit.

[Written for the Pacific Rural Press by Susan Swaysgood, Pomona.]

RAISING WHITE LEGHORN CHICKS.

These are the real commercial chicks of the coast. Without going into the merits or demerits of this variety, it is safe to say that they outnumber all other breeds and varieties, hence are deserving of proper notice.

No other chicks will stand the abuse these little fellows do and come out well. At the same time they pay well for good attention. To those who want to herd them in big bunches of twelve or fifteen hundred, I have nothing to say. They claim to save labor and fuel but when reckoning day comes I think the price comes out of the chicks.

Three hundred Leghorn chicks will thrive very well together but I do not think it pays to put more in one compartment.

For the first few days they should be confined to close quarters near their brooder so that they will learn the way to the warmth. It is best not to feed under 42 hours, then give them some form of soft food and fine oyster shell.

I make a bread of cracked wheat, steel-cut oatmeal, corn meal, middlings, and infertile eggs, mixed to a stiff batter with sweet skim milk. Bake slowly half a day and grind up in a food chopper.

This starts the little fellows off right, then if you have some skim milk for them to drink the first few days they will not fail to pay you back in growth. Chick feed, and after four or five days a mash, may be added to the bill-of-fare. But always give dry grain at night, either a good commercial chick feed or one of your own mixing.

If they get to picking toes, one of our subscribers, whose name I have forgotten, says, "give one teaspoonful of salt in the drinking water." I always put salt in the mash and never have any toe picking so this simple remedy apeals to me as being all right.

CHICKEN POX.

What is the matter with my chickens? Great big, hard, dry lumps come on their heads and keep getting larger till they die.—Mrs. R. D., Hanford.

Chicken pox is the matter. If readers would watch these columns a little closer they would not need to ask such simple questions. Clean up all refuse, give the chickens a dose of Epsom salts in their mash and rub the heads with vaseline.

RHODE ISLAND REDS.

Who keeps Rhode Island Reds in or near Pomona?—Mrs. W. J. Paine, Coachella.

Whil breeders please put a card in our directory so she can see for herself, as I do not know of any particular person? From the volume of questions similar to this one that come to Pacific Rural Press it is evident that many breeders are losing sales by not having a small card in the Poultry Directory of this journal.

CALIFORNIA ENTERS EGG-LAYING CONTEST.

This year's egg-laying contest at the Connecticut station opened November 1 with 100 pens of 10 hens each. From Prof. W. F. Kirkpatrick, in charge of the contest at Storrs, Ct., comes the following: "As the thing is lined up now, however, we expect to have 19 pens of Plymouth Rock, 16 Wyandotte, 20 Red, 30 Leghorn, and 10 miscellaneous, including Black and Buff Leghorn, Ancona, Sussex, Orpington, Oregon, Progressive and Rhinelander. Ontario has two pens and England has seven. Others are distributed among the following states: Connecticut, Massachusetts, Virginia, New Hampshire, California, Oregon, Ohio, Rhode Island, Pennsylvania, Vermont, New York, Missouri, Kansas, Illinois, Michigan and New Jersey.

FEEDING WHEN EGGS ARE SCARCE.

At this season of the year many people who have a few chickens get discouraged and say, "There is nothing in poultry, anyway." Some time ago I visited a large White Leghorn ranch where they keep an average of 15,000. Out of that large number, early in November, they were getting only a few hundred eggs a day. Yet they had no hard luck story to tell; they have made money and expect to continue doing so.

It is only the man or woman that keeps just a few that expects many eggs at this season, where good sense ought to tell them that not one hen out of ten will keep up her laying stunt all winter. The heavy breeds do better, considering the number kept, than the small breeds, but all hens lay off some during the late fall or early winter.

And yet there is a profit to be made. A poultryman has to have faith and feed his flock as faithfully when the eggs are not coming as when they are; but he should use judgment in the feeding. Too much fattening food to pullets or molting hens may make them so fat as to retard the laying. In such a case the profits are leaking out both ways. It is always safe to feed so that all stock have to exercise to get what they want. Exercise increases the circulation, thus keeping a good supply of blood to all parts of the organism. By nourishing all parts, the food is distributed, where without exercise it forms fat in certain parts, leaving the rest to practically starve for lack of nourishment. And this is where a good deal of the profits from poultry go.

Wm. A. French of Stockton reports the sale of a pen of poultry for $25 to a Long Island man as a result of his winnings at P. P. I. E. and also "I took your Mayor's (Rolph of San Francisco) check for $128 for poultry while there." It pays to show. Mr. French had over 50 birds entered.

In Modoc county 127 coyotes and 90 stray dogs were killed before Dec. 18. In Nevada counties of Elko, Washoe and Humboldt 266 coyotes had been killed. Lassen county is joining the merry war.

Fresno county is holding meetings to work up sentiment for a farm adviser. One-fifth of the farmers must become members of the "Farm Bureau" before the adviser is available.

Poultry Breeders Directory

MAHAJO WHITE ROCKS—Incubator Chicks, $25 pe hundred. Hatching Eggs $10 per hundred. The best all-purpose fowl for farms and the most profitable one. Lay well and consistently; best for capons and broilers. Beautiful snow white plumage. Gentle dispositions. Colonize them in your orchard and reap double profits. Send for catalogue. At Panama-Pacific Poultry Show were awarded sweepstake on Cock (295 Egg type), as best utility bird in show—200 Birds competing. Mahajo Farm, Box 597, Sacramento, Cal.

BABY CHICKS—All sturdy youngsters from good stock and hatched right. Rhode Island Reds. Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Orders booked now for delivery any time to suit you. Campbell Poultry Ranch, Campbell, Cal.

STIRLING FARM—Place your order now for eggs and chicks from Stirling Layers. Utility Leghorns exclusively. Our pure-bred tested layers are bred for size, vigor, quality and heavy-egg production. Send for descriptive circular and prices. Route 2, Box 1416, Sacramento, Cal.

MACFARLANE STRAIN WHITE LEGHORN eggs, $1.50 per 15, $2.50 per 20, $5.00 per 100; chicks Dec., Jan., Feb., 12c each, afterward 10c. Order now, any quantity. Cockerels, $2.50. Big plant, low prices, stock better than ever. Catalogue free, correspondence solicited. Newton Poultry Farm, Dept. 1, Los Gatos, Cal.

MAKE BIG MONEY with our White Orpingtons. Best breed for every need. Lay most when prices highest; make finest eating; return greatest profit. 1000 grand range-raised birds, trap-nested and bred for heavy laying. Eggs, chicks, stock. Prices reasonable. Catalog free. Whitten Ranch, R. D. 5, Box 647, Los Angeles.

WHITE PLUMAGE POULTRY FARM and Hatchery. Sells day-old chicks from healthy, vigorous breeders. White Leghorns at $10 per 100, $90 per 1000. Barred Rocks and Rhode Island Reds at $15 per 100. We sell the Victor Incubator and Brooder. Circulars free. H. A. Schlotthauer, Exeter, Cal.

BARRED PLYMOUTH ROCKS—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for Catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 398, Los Gatos, Cal.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs, Baby Chicks and 10 weeks' old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired **Heavy Winter Layers.** W. C. Smith, Prop., Corning Cal.

PENN'S QUALITY BARRED PLYMOUTH ROCKS—At the World's Poultry Exhibition, San Francisco, our **Western Bred** Rocks ranked among the best in the world, both in untility and exhibition points. Catalogue free. Breeding stock and eggs for sale. Golden Rule Poultry Farm, St. Helena, Cal.

PERFECTION FIRELESS BROODERS—There is none better. Simple, inexpensive, easy to operate. Free trial. Ask for particulars. H. R. Teal, Willits, Cal.

ROOFDEN CHICKS are hatching every week. When do you want yours? White Leghorns that are worth while, by hundred or thousand. Black Minorcas, beauties, great layers of big eggs, and a hardy strain. Rhode Island Reds, the breed for meat and winter eggs. We can supply you with prices that are right. Ask us. Circular free Roofden Poultry Ranch and Hatchery, Campbell, Cal.

ALL KINDS OF BREEDING and laying hens, roosters and pullets. Petaluma incubators, new and used. Baby chicks of Brahmas, Orpingtons, Anconas, White and Barred Rocks, Rhode Island Reds, Black Minorcas, Buff, White and Brown Leghorns. Best quality. Prices reasonable. Immediate deliveries. Brown's Poultry Yards, 2550 San Pablo Ave., Oakland, Cal. **Closed Sundays.**

WE LEAD IN CAPACITY—THE SANTA CLARA VALLEY HATCHERY AND POULTRY RANCH—We can serve you with the best the Valley can afford; 8 varieties of baby chicks. White leghorns in 1000 lots a specialty. Your correspondence solicited. Information cheerfully given. Route 6, Box 336C, San Jose, Cal.

BROWN LEGHORN, WHITE LEGHORN day-old chicks that are well-hatched and strong, from healthy vigorous breeders. SAN JOSE HATCHERY, 373 Meridian Road, San Jose, Cal. "Chicks well hatched are half-raised."

INCUBATORS AT MANUFACTURERS' PRICES—To assist the poultry industry, we are making this concession. Write the GEO. R. CROLEY CO., INC., 631-637 Brannan St., San Francisco, for particulars.

WHITE ROCK BABY CHICKS from good winter layers. Booking orders now. Early hatched chicks make early Fall layers. Few Hoganized cocks for sale. Mrs. J. B. Tupper, Ceres, Cal.

WHITE LEGHORN BABIES and Hatching Eggs from Hoganized heavy-laying strain. Correspondence solicited. The O. C. McDonald Poultry Ranch, King and Jefferson, San Jose, Cal.

BARRED ROCK COCKERELS—$2.50 each. Am booking orders for Rhode Island Red and Barred Rock chicks for February, 15c each. G. L. Hawley, Madera, Cal.

HATCHING EGGS from Hoganized S. C. W. Leghorn two-year-old hens, $1 per setting, $5 per 100. Also breeding hens, $1 each. Allendorf Egg Ranch, Kerman, Cal

BABY CHICKS AND EGGS—Hoganized Black Minorca, White Leghorn stock specialties. Free instructions on raising chicks. Hicks Jubilee Hatchery, Petaluma.

WHITE LEGHORNS—Hoganized. Bred to lay. Booking orders now for hatching eggs. $6 per 100, $50 per 1000. No chix. R. H. Dickinson, Los Gatos, Cal.

BABY CHICKS—Eastman's bred-to-lay Barred Plymouth Rocks from Hoganized and trap-nested stock. Fairmead Poultry Farm, Fairmead, Cal.

WHITE ORPINGTONS—200 egg strain and Buttercups, the new farmer's fowl. Write for prices and description. M. S. Woodhams, San Mateo.

BUFF ORPINGTON COCKERELS—Fancy and Utility. Good in type and color, weighing 9 to 11 pounds. Mrs. C. M. Smythe, R. 3, Stockton.

ORPINGTONS: BUFF AND WHITE—Black Minorcas and Carneaux pigeons. Cockerels ready for service. Susan Swaysgood, R. 2, Pomona, Cal.

WHITE LEGHORN BABY CHICKS that are hatched right, from good stock. Order now for spring delivery. Mrs. G. Logan, Morgan Hill, Cal.

EAST SACRAMENTO HATCHERY—Capacity, 16,000. Special low price for large lots of chicks. Box 1205, M St. Road, Sacramento, Cal.

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

S. C. RHODE ISLAND REDS—Bred to lay. Hatching eggs and baby chicks. Cocks and Cockerels. E. C. Quessenberry, R. 4, Lodi, Cal.

RHODE ISLAND RED BABY CHICKS and Eggs. Heavy laying strain. Send for circular. Rosedale Ranch, R. 1, Hayward, Cal.

TRAP-NESTED LEGHORNS—Eggs and chicks. Heavy layers. Write for catalogue W. G. Suits, 378 Bandini Ave., Riverside, Cal.

BLACK MINORCA, R. I. Red, Buff Orpington Cockerels. Eggs for hatching. Mrs. R. A. Holdridge, P. O. Box 282, Dixon, Cal.

TRAPNESTED S. C. RHODE ISLAND REDS—Eggs and Fine Breeding Cocks. Wm. Larm, 3915 39th Ave., Oakland, Cal.

TRAPNESTED LEGHORNS—White and Buff Stock. Eggs, chickens. Arthur R. Schroeder, Box 179R, Mountain View, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, PEA FOWL. Address Wm. A. French, 545 W. Park St., Stockton, Cal.

S. C. RHODE ISLAND REDS—Hatching eggs, Baby chicks and cockerels. Mrs. V. P. Hewitt, Dixon, Cal.

SINGLE COMB Rhode Island Reds. Eggs and stock for sale. Dirk Dairy Farm, Lemoore, Cal.

BLACK MINORCAS—Cockerels. Reasonble. Chester Fosgate, Quito Road, Campbell, Cal.

HARES AND RABBITS.

MODERN RABBITRY—Flemish Giants and New Zealand Reds. Imported strains; best to be had. 100 breeding and fattening pens. Can be loaded on flat cars. Rabbitry returns this Fall amounted to over $300. Receipts for same. Our ranch will be sold, so we must sell. Will sell at cost for cash or trade. L. F. Strener, Route 1, Box 5, Hughson, Cal.

LEADING RABBITRY IN AMERICA—Flemish Giants and New Zealands. Cut your living expenses. Catalogue free. Empire Rabbitry, Empire, Cal.

BELGIAN HARES—Young stock for sale. Hurd Bros. St. Helena, Cal.

TURKEYS, DUCKS AND GEESE.

MAMMOTH BRONZE TURKEYS—THE BEST IN THE WEST—Extra special prices. Further information cheerfully given. Write now to secure best birds. Geo. A. Smith, Corcoran, Cal.

GHART'S BRONZE TURKEYS—Vigorous young stock. Also large yearling hens, $5 each. Eggs in season. Circulars free. Albert M. Hart, Clements, Cal.

THOROUGHBREDS—White Holland Turkeys, White African Guineas for breeding. T. M. Calvert, McFarland, Cal.

The Home Circle Page of the Pacific Rural Press

THE WASH DAY MENU.

That amusing verse in a recent Home Circle page, "When Mandy Starts to Wash," and its reference to cold beans for dinner calls to mind that beans are not to be despised as a food at any time, and on "wash day" are particularly appropriate as a dish to be prepared with little trouble or attention. This counts, especially where one person attempts to do justice equally to table and tub.

In general one ought to select for the day such food as can be quickest prepared and that is nourishing. Quite likely this may include some favorite dishes of the family. The point is to leave all elaborate things for other times, provide good solid food for yourself or the help, and this day do without stirring or peeling or paring or garnishing or pink ribbons. Just serve and be happy.

A sustaining and very cheap and ready meal can be made of lima beans. These are good hot or cold and the day after. Soak 1 pint of dry lima beans over night so that in the morning you can pour off the water, while you heat 3 pints of fresh water to the boiling point. This you pour on the beans and then let them boil slowly at the back of the stove, say for an hour and a half. For flavor add salt and pepper and three thin slices of bacon about a half hour before the beans are done. Or, instead of pork, put in 2 tablespoonfuls of butter.

Macaroni and cheese is another dish as easy to cook as it is to enjoy. For four people try: in salted water boil ½ package macaroni for fifteen or twenty minutes, which is ample time to make good macaroni tender; pour off the water and put the larger part of macaroni in a deep pan or baking dish; take ½ pound cheese crumbed or broken up and put most of it over the contents of the pan. Then add the other part of the macaroni and sprinkle the remaining cheese over the top, with several little lumps of butter; cover this level with milk, after which sprinkle 2 tablespoonfuls of cracker crumbs of 1 of flour over it with a dash of pepper. Bake for a half hour in a hot oven. The total time of preparing this dish ought to be but 50 minutes. There are scores of macaroni or spaghetti dishes that are just as satisfactory. Lettuce, with a plain salt-pepper-vinegar seasoning, or with a ready prepared dressing, or with oil and vinegar, is a good thing to serve with a macaroni menu.

If a meat dish is considered necessary instead of one of the foregoing, neck of lamb goes quickly. Two pounds of the meat may be cut into small pieces for boiling and put into 4 quarts of water, for it can cook slowly for about two hours without attention. About one-half hour before the meat is ready for serving add 2 cups of dry rice, washed, and a can of tomatoes, and season with parsley, celery leaves and onion or garlic.

Neither does corned beef and cabbage require much care in the preparing. The corned beef should be cooked slowly about 4 hours the day before and left standing in the water for the cabbage to be added to it. However, if this water proves to be too salty it may be poured off and fresh water substituted. In either case the water should be heated separately to the boiling point and poured onto the corned beef and the cabbage, and then kept boiling for an hour and a half slowly. Peeled quartered potatoes may be added a half hour before the cabbage is done, and such seasoning as may be required.

The best dessert for a menu such as the above is a dish of prunes in some form, because it goes quickly. Prunes and rice may be prepared by spreading sweet stewed prunes over the bottom of a bowl. Fill this with boiled rice (hot or cold) and press it down to hold its shape, then turn it out of the mold and serve with the sweet juice of prunes, or with cream.

AN INCOMPARABLE POTATO CAKE.

(This Week's Preferred Recipe.)

This cake has been tried often and has never failed to give satisfaction, and is always good to repeat. It quickly becomes a home favorite. The quantity in the following recipe is for a large cake pan:

2 cups sugar creamed with 1 cup butter, or less of some other shortening; 4 tablesp. ground chocolate, 4 beaten eggs, 1 cup seeded raisins, 1 cup hot mashed potatoes, ½ cup milk, 2 cups sifted flour, 1 cup chopped walnut meats, 1 teasp. mixed cinnamon, cloves and nutmeg, 2 teasp. baking powder, 1 teasp. salt and 1 teasp. vanilla extract.

This is to be baked in a rather slow oven. It makes a fruity and delicious cake.

THIS WEEK'S BEST HOUSEHOLD HELP.

To have something serviceable, economical and stylish to wear—buy blue serge. Blue serge is always in style and is always in the shops. It makes attractive gowns for morning or afternoon wear and for church going. It combines tastefully with furs or plaids. It wears durably. It is suitable for matrons and misses, and the best all round costume that can be made of it is a middy blouse and skirt, either home made or ready bought. Worn with a nifty tie it is very attractive.

CHOOSING WINTER HATS.

There is some thought to be exercised in selecting the hat this year, with the flaring collars in fashion. With a coat that has a flaring collar a flat-crowned hat with broad brim does not set to advantage unless one is rather tall. The tendency of this combination is to give a dumpy appearance, which it takes height to overcome.

A high crowned hat is just as much in style now as the flat crowned hat, and a high turban will prove very suitable to many women. All kinds of combinations of furs and flowers are favored for trimming, and one's own taste has ample play. Ostrich feathers too are again stylish, the manner of applying them to the hat being a departure from former modes. They are bunched, three or four, at the backs of the high crowned hats; or to some tastes in front. This includes the rather large tips or the nattier small ones. On flat brimmed hats ostrich feathers are laid flat, very effectively, to cover them.

EXPERIENCE EXCHANGE.

All readers are invited to exchange special recipes or household hints through this department. Selected ones will be published.

Mrs. D. L. M. of Porterville desires a recipe for chocolate pie.

Mrs. E. H. Phreaner, Placerville, prevents grape jelly candying by adding 2 tablesp. extracted honey to 1 lb. jelly, lets it boil two minutes longer and then fills jelly glasses.

Who knows anything of an onion and celery sandwich for afternoon teas? A subscriber has heard of something of the kind and wants to know more.

HEADGEAR GOSSIP.

A beautiful little turban, more oval than round, made of gray maline and covered with silver lace, has a smart bow of blue velvet ribbon about an inch and a half wide, with one long loop and two ends hanging over the hair.

Another lovely creation of the milliner's artistic fingers is made of crushed strawberry maline and gold lace, and with crushed strawberry velvet ribbon hung in streamers to the waist. This hat has a little brim with gold lace falling slightly over the edge. One large crushed strawberry rose is placed a little to one side of the crown.

A hat of black maline and jet beads has the top filled high with maline loosely caught. A black ostrich fancy is the sole trimming.

HELP GIRLS IN DRESS.

If style continues to lead this country a merry but ruinous dance, more organizations will be formed like that in Brooklyn, the Appropropriate Dress Club.

It was formed to protest at extremes in fashions and to help its members, working girls and women, to dress comfortably and neatly and attractively at reasonable cost. This aid is partly financial. A girl may buy her clothing through it on the installment plan but not at the exorbitant prices charged by installment suit houses. The clothing is bought for her at cash prices with her installments. And she gets better clothing, too. Philanthropic women organized and are promoting the club.

Really Funny.—"She says I am dull." "You should crack a few jokes occasionally. Ask her to marry you, or something like that."—Puck.

MRS. BEST'S BULLETIN.

My Dear Friends:

There was little to invite the seeker after novelty the past week in a tour of the marts, though a hunter for bargains might have found things very much to her enjoyment. Odd lots and odd sizes and things too long in vogue were going at prices to make you wish you could have afforded waiting.

Those sweet little white turbans that made a girl's red cheeks look so rosy red were going like a flock of frightened seagulls, at something like $1.95. And what with the rain coming down in earnest now, I don't think they are coming back.

Saw a lovely maroon silk velours-upholstered armchair of mahogany, with such cushions! They asked $150.00.

The kid gloves with the over seam are now quite prominently displayed. Most fetching are the dark ones with the white stitches, but for practical reasons I should choose the white ones with dark stitches. The white thread is apt to soil more easily.

A silver eyelet punch, hollow within for a needlecase, is 75 cents. And there's a little chain to carry it by.

Japanese incense holders in novel shapes are seen on all sides. The cleverest I think is a china coolie in bright colors who sits with a pipe in his hand and his mouth open to exhale the smoke. These things run in cost up to $1.

For evening wear the pearl and iridescent glass beads and pearl and silver spangles are being worked up into garniture, so that some of the ball and reception costumes give the wearer the appearance—well, of a cut-glass chandelier.

Should you care for the high Prussian boots of broadcloth, with black velvet knots on the tops, a very smart pair is obtainable at $20.

The high lace shoes for the high skirts are themselves high, about $9 for average ones. This is due to the larger and select pieces of material needed for the uppers, as much as to anything.

Do you remember (if you can remember back thirty years) the decorated cup and saucer—very large cup, very decorated—that was a staple gift and was considered too sacred to use for drinking out of? I thought they were all gone, but I saw several specimens just the other day, and On Sale! Most of them had painted in gilt on them: "To One I Love."

But one thing that has entirely disappeared is the moustache cup. It has bid us farewell.

Which is a hint for me to say good bye too. Devotedly,

ROSABELLA BEST.

(Note—Readers wishing information from Mrs. Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

The children of the Oroville schools did a commendable thing the other day. There was a large number of orange trees in the schoolyard heavily laden with fine fruit. The trustees left it to the children what to do with the crop, with the result that the oranges were picked, packed and shipped to the schoolchildren of the mountain district of Butte county.

THE HOMELAND.

By DANA BURNET.

My land was the west land; my home
was on the hill,
I never think of my land but it
makes my heart to thrill;
I never smell the west wind that
blows the golden skies,
But old desire is in my feet and
dreams are in my eyes.

My home crowned the high land; it
had a stately grace.
I never think of my land but I see
my mother's face;
I never smell the west wind that
blows the silver ships
But old delight is in my heart and
mirth is on my lips.

My land was a high land; my home
was near the skies.
I never think of my land but a light
is in my eyes,
I never smell the west wind that
blows the summer rain—
But I am at my mother's knee, a lit-
tle lad again.

—Literary Digest.

LITTLE TAD LINCOLN.

Tad Lincoln, the youngest of President Lincoln's four sons, was eight years old when his father went to the White House. He was a merry, lovable, mischievous boy, generally happy and jolly, although Miss Helen Nicolay tells in her "Personal Traits of Abraham Lincoln" of one time when Tad must have been unhappy. One of Lincoln's neighbors was "attracted to the door one day by hearing children cry. He saw Mr. Lincoln striding by with two of his sons, both wailing loudly. 'Why, what is the matter with the boys?' he asked. 'Just what is the matter with the whole world,' was Lincoln's answer. 'I've got three walnuts, and each boy wants two.'"

Tad had pretty much his own way in the White House; he was permitted to roam where he would, interrupt whom he might, and beat his little drum about the corridors until his own ears ached, to say nothing of the tortured ears of Senators and Congressmen, diplomats and ministers. When artists came to paint the President's portrait, and established themselves with their easels and their fat tubes of paint in the President's room, Tad and his brother William lost no time in getting hold of that glorious paint and using it on each other's noses and chins. The artists' annoyed protests finally brought from Mr. Lincoln the mild remonstrance, "Boys, boys, you must not meddle. Now run away and have your faces washed."

Mr. Lincoln was always lenient with his children, says Youth's Companion. When they clambered about and over him, he pushed them aside with gentle hands, but he never turned them out of the room or rebuked them. Secretary Stanton used to turn white with fury when he saw his chief, with infinite patience, break off from an important state discussion and listen to one of Tad's tales.

The great day of the boy's life was that on which he staged a wonderful circus in the attic of the Executive Mansion. All went well for a time, for the collie did not hate cats and the little cur was securely tied, and could only emit piercing barks. But when Tad induced part of his audience to help him bring up the goat, trouble began. There was much butting and bumping, pushing and tail wagging on the part of old "White Bill," who had no ambition to excel in entertaining the public, and the excitement finally unnerved the collie, who made a dive for Bill, and paid back an old grudge with a horrid little bite. Bill would not stand that, and down the attic stairs came cats and audience, dogs and Tad, tumbling and racing in one grand mix-up. That affair was unique in the White House, and nothing of the kind has ever been permitted since.

Abraham Lincoln was always very careful to use words that his boys could comprehend, and they never failed to take an interest in his affairs. It was on April 11, 1865, after the surrender of General Lee's army, that Mr. Lincoln was speaking from a White House window to a large crowd gathered below, and he asked them the question, "What shall we do with the Confederates?" A voice answered from the crowd, "Hang them!"

Tad, from within the room, saw his father's pained expression, and he shouted, "No, no, papa, not hang them! Hang on to them!" And Mr. Lincoln's smile was radiantly grateful as he shouted to the crowd below, "Tad has got it! We must hang on to them!"

Four days later the father was dead, and before he was nineteen Tad followed him to the grave. The world lost a brave and sunny spirit when Tad Lincoln died.

TAKE HEED, BRIDES.

It is in Monroe, Wis.,
So says a dispatch,
That T. Sauerman, magistrate,
Who marries people,
Makes a hit with grooms—
Who, by the way,
Have to be eugenic.
He makes a hit with them
By asking the bride
"Can you bake?"
And if she says, "Sure!"
He marries 'em.
And if not, not.
Sometimes it's not.
So stay away from Monroe,
Or else learn how
To bake.

WHERE THERE'S A WILL.

"My husband," said the matron, "was a confirmed smoker when I married him a year ago, but today he never touches tobacco."

"That's fine," approved one of the group. "To break off the habit of a lifetime in one year requires a strong will indeed."

"Well," remarked the wife meditatively, "that's just the kind of a will I've got."

Not So Reckless.—"As I understand it, you lecture on the subject of peace at any price." "No. My rates are $200 per lecture."—Louisville Courier-Journal.

A PASTY COMPLEXION.

After a busy day of golfing and an evening of automobiling, Jane's skin was irritated from the combined effects of sun and wind; so she liberally "cold-creamed" her face and hands and settled herself for a good night's rest.

In a few minutes her face began to feel stiff and drawn. "At last," she thought, "the expected has happened. I have paralysis."

Her nervousness increased when her fingers became unmanageable, and her skin began to crack and snap.

She hastily turned on the light and found her face alarmingly waxy and shiny. What could be the cause?

Finally she rushed for the tube of cold cream. It was labeled "Library Paste."—Youth's Companion.

The Markets.

Unless otherwise noted, prices quoted are f. o. b. San Francisco.

San Francisco, Jan. 5, 1916.

WHEAT.

The local market shows no further change, and trading has not yet recovered from the holiday curtailment, as local buying interests have fair supplies. A better buying movement is reported in the north, where the movement for some time has been mostly to the East, but a great deal of wheat is still held in the country.

Cal. Club, ctl.	$1.70 @1.72½
Northern Bluestem	1.80 @1.82½
Northern Club	1.72½ @1.75
Northern Red	1.65 @1.80

BARLEY.

Supplies in the State are still quite large, and with poor shipping facilities, and no great local demand, the market is rather easy in tone, both for spot and future delivery. Feed is quoted a little lower, with little business at the decline.

Shipping, ctl.	$1.30@1.35
Choice Feed, ctl.	1.27½ @1.30

OATS.

The movement in this grain is light, with the consuming trade buying in rather small lots, according to current needs. Values stand as before.

Red Feed	$1.30@1.35
Red Seed	1.45@1.65
White	1.35@1.40

CORN.

Yellow, both Eastern and California, is steadily held at the recent advance, the local grain being offered in rather small lots. Egyptian, etc., are moving well in the country, and there is considerable business in them here. The cheap stock is well cleaned up, and both Milo and Egyptian are slightly higher.

Eastern yellow, ctl.	$1.70@1.75
Milo Maize	1.40@1.45
Kaffir	1.65@1.70
Egyptian	1.45@1.55

BEANS.

The bean market still shows the dullness of the last few weeks, as the distributing trade all over the country is occupied with other things and the need for more stock is not yet urgent. A general resumption of demand, however, is expected before the end of the month. Small whites have again been marked up, as they are pretty well cleaned up, and there are signs of a strong Eastern demand.

(On wharf, San Francisco.)

Bayos, per ctl	$5.00@5.10
Blackeyes	3.50@3.60
Cranberry Beans	5.10@5.20
Horse Beans	3.25@3.50
Small Whites (south)	5.80@5.90
Large Whites	5.60@5.75
Pinks	4.25@4.30
Limas (south)	4.60@4.70
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65

SEEDS.

The market shows little feature, buying being light at the moment in nearly all lines, though more activity is expected soon.

Alfalfa, per lb	18 @19 c
Melilotus Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

The unsettled weather has caused shippers to hold back a little, but the local demand is not especially urgent just now, though as a rule stocks are not heavy. Stock hay is coming into more prominence, both here and in the country, as the continued rain necessitates a good deal of feeding elsewhere. Offerings of all grades, however, are of very moderate proportions, and with a strong demand in the interior of the State the market is firm.

No. 1 Wheat	$12.00@15.00
No. 2	10.00@11.50
Tame Oats	10.00@16.50
Wild Oats	8.00@11.50
Alfalfa	10.00@14.00
Stock Hay	6.00@ 9.00
Straw, per bale	.25@ .40

FEEDSTUFFS.

There is quite an active demand in the country, especially for the cheaper feeds, though the local business is rather quiet. Beet pulp has been advanced, while other lines are unchanged, rolled barley being a little easy.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$21.00@22.00
Alfalfa Meal, per ton	18.00@20.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	25.00@26.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	38.00@39.00
Middlings	32.00@33.00
Rolled Barley	26.50@27.50
Rolled Oats	29.50@31.00

VEGETABLES.

The demand for garden truck after a slight spurt at the close of last week, has been very light, and weather conditions have not helped. Offerings have been sufficient, but of poor quality in several lines, which has tended to weaken values, though there are no quotable declines. Rhubarb is coming in slowly, and is fairly firm; while southern beans and peas are unattractive and offerings are slow to move at the old prices. Good tomatoes bring slightly better prices, but general offerings are inclined to drag, and eggplant, peppers, etc., find limited sale. Artichokes are still held at rather high prices, with limited offerings, while celery and lettuce are steady.

Sprouts, lb	3@ 4 c
Rhubarb, box	$1.00@1.25
Peas, southern, lb.	.08@ .10
String Beans	.08@ .12
Lima Beans	.08@ .10
Peppers, bell, lb	.05@ .06
Tomatoes, L. A., crate	.75@1.00
Eggplant, lb	.05@ .07
Celery, crate	2.25@2.50
Artichokes, doz.	.50@1.00
Lettuce, small, crate	1.00@1.25

POTATOES AND ONIONS.

California stock is getting down to narrow limits, and supplies from outside States are being brought in, with higher prices in most lines. Both Oregon and Delta potatoes are somewhat higher, while Salinas stock, though rather scarce, is unchanged. Sweets are also higher, with light supplies. Onions have been marked up sharply, and California stock is rapidly cleaning up.

(On Wharf.)

Oregon Burbanks	$1.35@1.55
Salinas Burbanks	1.85@1.90
Delta Burbanks	1.25@1.35
Sweet Potatoes, ctl.	1.30@1.75
Onions, Delta, ctl	1.15@1.35
Oregon	1.50
Garlic, per lb	.10@12½c

POULTRY.

The New Year turkey market again made a sharp advance, with supplies very scarce, and values are still held above last week, though there is little business in turkeys now. Chickens show no change, and business has been extremely dull for the last fortnight, though there is not enough stock coming in to depress the market. Ducks and Belgian hares are higher.

Turkeys, dressed,	24@30c
Live Turkeys, old, lb.	19@20c
do, young	20@21c
Broilers, 15 lbs to doz. and less, lb	30c
do, over 15 lbs. to doz.	23@25c
Fryers	21@22c
Hens, extra, per lb	16@17c
Small	15@16c
Smooth Young Roosters, per lb.	17@19c
Squabs, per doz	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb	18@19c
Old	14@15c
Belgian Hares	9@11c

BUTTER.

All grades have dropped off a little since the holidays, as the local demand has been less active, and there is not much demand for shipment, while arrivals the last few days have been quite heavy.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	28	28	..	27	26½	26½
Prime Firsts	27	26½	..	26½	26	25½
Firsts	25½	25	..	25	25	25

EGGS.

Eggs have shown a gradual decline up to a few days ago, with unusually large offerings for this time of the year, and extras are about 15 cents lower than a year ago. Within the last two days this grade has recovered a little, as most of the arrivals are off grade, and the extra quality is needed.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	35	33	..	31	32	32½
Sel. Pullets	28	28	..	28	29	29½

CHEESE.

Y. A.'s are still steadily held, and flats have recovered a little, with offerings cleaning up fairly well. Monterey cheese is arriving more freely, causing easier prices.

Y. A.'s fancy	17 c
Fancy Calif. flats, per lb.	15 c
Calif. Cheddar flats, per lb.	Nominal

DECIDUOUS FRUITS.

With disagreeable weather, there has been practically nothing doing in the fruit market the last few days; and there is practically nothing offered except apples. The end of the year about cleaned up the fresh stock, and from now on the apples will be mostly cold storage stock. Supplies are not excessive, and values are well maintained.

Cranberries, Eastern, bbl.	$11.50@12.50
Oregon, box	3.50@ 3.75
Apples, Newtown	.75@ 1.25
Pearmain	1.00@ 1.25
Oregon Spitzenbergs	1.50@2.50
Persimmons, box	.75@ 1.25

DRIED FRUITS.

Prices are unchanged, and there has not been enough business in the last fortnight to show any new tendencies in the market. Dealers in consuming markets are busy at present with stock-taking and other year-end operations, and are likely to take a couple of weeks more before getting actively into the market. Local packers, also, are still very busy with office work, and so far have shown little interest in country offerings, as there is little to be had at prices which promise much speculative profit. There is no doubt of a renewed consuming demand within a few weeks, however, and all available supplies should find a ready market in the spring, whether or not export buying is renewed. Apples show a slight easiness, as there has been no demand of late; while apricots and figs of desirable quality are eagerly sought. Prunes are becoming scarce, and are very closely held, the demand being especially for extremely large and small sizes. Peaches receive no attention at the moment, but with light offerings, and short supplies in other lines, the outlook is favorable to holders. The New York Journal of Commerce says:

"Brokers report that conditions which have ruled in the New York spot market for California prunes for several weeks can not be expected to change until after the middle of the month, when a recovery from the holiday dullness may be expected. It seems to be a fairly general opinion among the New York brokers that the next movement in the market will display a firmer tone.

"The California apricot market continues very strong, and while no quotable change has been made in the general range of prices there does not appear to be any inclination to shade figures in any quarter. Peaches are also maintained on a very steady basis, with the market very quiet and buying in all quarters restricted to small quantities."

Apples	6½ @7½c
Apricots, per lb.	9 @12 c
Figs, white	5 @6 c
Black	3½c
Calimyrna	8 @10 c
Prunes	4¾ @6 c
Peaches	4½ @6 c
Pears	4 @7 c

(Associated Raisin Co. Prices.)

Fancy Seeded, 16 oz.	7 c
Choice Seeded, 16 oz.	6¾c
Thompson Seedless, No 1, 16 oz	7¾c
Sultanas, 16 oz.	7¼c
Loose Muscatels	6¾c
London Layers, 3crown, 20-lb. box	1.25
Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50 lb. box	2.75

CITRUS FRUITS.

The eastern auction markets remain unchanged on California oranges and lemons. Practically all oranges from Butte and Tulare counties have been shipped and at present but few cars are being sent from southern California. Shipments from the south will start in strongly very soon.

At New York on Monday, Jan. 3d, the auction prices averaged from $1.70 to $2.80 per box for navels, and from $2.55 to $3.55 for lemons. At Chicago the auction prices for navels averaged from $2 to $3 per box; for lemons $3.50 to $4.25.

The total shipments from Tulare county will be a little less this season than last year, while Butte county has sent out a few cars more this year over last.

Oranges are in good supply at San Francisco and generally of attractive quality. While the demand has been limited the last few days, there is a tendency for local sales to pick up, and values are steadily maintained on navels, tangerines being slightly easier. Lemons also are steady. Lemonettes have been marked down a little.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50@2.75
Tangerines	1.25@1.75
Grapefruit,	2.00@3.00
Lemons, box	1.50@3.75
Lemonettes, box	1.25@1.75

HONEY.

The top price on water white comb has been reduced slightly, while amber is a little firmer. Otherwise values stand about as before, though there seems to be a little more demand for liquid dark extracted, and some shipping demand is reported. There is no urgent demand here, however, and prices show no tendency to advance. A good deal of Hawaiian honey is arriving.

Water White, comb	13@15c
Amber	8@12 c
Water White, extracted	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

The nut market is featureless, owing to the seasonable lack of demand, as well as the close cleanup in some

Special Live Stock Market Report.

Receipts of light hogs fell off some in this market last week and prices stiffened somewhat as a result. The bulk of light hogs in California seem to have been marketed in the recent heavy runs and receipts are expected to be light for several weeks. The dressed meat market shows some improvement since the holidays which is aiding in the price raising. The situation is about the same in Utah, Idaho and Oregon. Reports from Chicago indicate that the swine situation is righting itself there also.

The dressed beef market is assuming more activity since the holidays and the demand is stronger, although prices remain unchanged. The surplus which accumulated during the holidays is being worked off and receipts are holding about the same. Demand for both sheep and lambs is strong and receipts hold at about the same mark as last week. With the exception of the increase in price in light hogs last week's quotations still hold good.

WOOL.

The looked-for activity in wool after the first of the year did not materialize and things are practically at a standstill in the local market. A wire from Philadelphia on the day this is written says that "defective wools are not in demand and are a drug on the market." There is scarcely any city or country buying reported at this market at this time.

lines. There are still a good many odd lots of almonds scattered around the state, but on the whole the market is firm; while the only large offerings of walnuts are of Oriental stock.

(Prices f. o. b. San Francisco.)

- Six months .....12 @13 c
- San Joaquin (defective) 9 @10 c
- Northern, free .....10 @15 c
- S'thern Mountain, free 11 @12 c
- Tehama Co., free ....12 @14 c

HORSES.

This market has been very uninteresting the past week. Unfavorable weather has tended to keep buyers away from the stables, even if there had been any attractive offerings; and nothing of any consequence has been shipped in, the only recent sale worth mentioning being a lot of road contractors' horses sold in Santa Clara county.

(Approximate values at San Francisco, based on auction sales.)

- Drafters, 1700 lbs. and up $200@225
- Drafters, 1550 to 1650 .. 150@200
- Chunks, 1350 to 1500 lbs. 150@175
- Wagon horses, 1050 to 1350 lbs. ..... 110@150
- Green Mountain range horses, 950 to 1200 lbs. 20@ 75
- Farm Workers ..... 50@100

GROCERIES.

The lines quoted are unchanged. Coffee is quiet, and the large crop in Central America may weaken prices as shipments increase. Codfish is again advancing.

(Wholesale prices, San Francisco.)

- Flour, Family Extras, per bbl. .....$6.00@6.40
- Sugar, granulated, per lb:
- Cane 6.65c
- Beet 6.45c

Publisher's Department

In the annual review number of the California Fruit News, issued Dec. 25th, Howard C. Rowley, the publisher, has "put one over." The paper contains 84 pages of well written articles, fruit statistics, and advertisements, that are of value to every man connected with the fruit industry of California. This review number sells for 25 cents per copy and is worth the price many times over. Send for a copy.

The number of new subscribers received last week fell off to 101, owing to too much holiday spirit among the field force. However, we anticipate a big gain next week.

Three new books received from the Orange Judd Company, of 315 Fourth Ave., New York, are of interest to our readers. "The Manufacture of Ice Creams and Ices" treats the subject of ice cream making in an interesting and practical manner. The enormous growth of this industry makes the book of value especially to dairymen and dairy students. Cloth bound, illustrated. 325 pages, price $2 net.

"Mushroom Growing" by B. M. Duggar, 250 pages, illustrated, cloth bound, price $2.00 net. Tells how to grow and market this profitable vegetable.

"Sweet Corn" by Albert E. Wilkinson, 204 pages, illustrated, cloth bound, price 75c net. Treats of varieties, planting, growing, care, harvesting, insects and diseases, marketing, etc. A good book for those growing sweet corn.

GERMAIN'S 1916 CATALOGUE.

Germain Seed & Plant Co.'s 1916 General Catalogue is now off press and will be mailed free to those who ask or write for it. So full of planting and cultural directions is this book, that it has been properly termed a Garden Encyclopedia. This marks the 45th successful year of the company, and by means of their Bulb and Poultry catalogues, besides the 104-page General catalogue for 1916, they furnish the amateur or professional gardener or poultryman with a quantity of extremely valuable information. Do not fail to send for these catalogues, as they are valuable to you.

SUCCESSFUL GARDENING BOOKS.
(From Los Angeles Graphic.)

Unique in so many things, California is also different from the rest of the gardening world in several points. There are two springs, there is almost no dormant time, there are all varieties of soil and climate; best of all, there are limitless possibilities. But because it is so different in so many vital points, the accepted truths of gardening are not all the truth of California. For this reason the ambitious gardener, whether he gardens for pleasure or profit, needs a book to guide his efforts written of California by an experienced California man. No eastern book, however complete, can give him what he needs, for even the pests are different.

Such books have been written on the subject of both vegetables and flowers by Mr. Edward J. Wickson, professor of horticulture in the University of California and editor of the Pacific Rural Press. In the "California Vegetables in Garden and Field" can be found the simplest and most complete directions for every soil and every vegetable grown in California. As essentials to success in gardening, Mr. Wickson names, "Will, Water, Work." There is another, if the gardener would know the richest return of his labor, love of the work, joy in the smell of the earth, satisfaction in its yield!

Beginning with preparation of the soil, ways of irrigation and ditching of the ground for distribution of the water, the book goes minutely into every detail of planting, growing and marketing. Each variety of vegetable has a chapter denoted. Nothing was forgotten or omitted in this most complete aid to successful gardening. Acceptable at any time of the year, as it is always the time to plant something, "California Vegetables" should be on everybody's list.

Between the extremes of the botanists's pride and delight, and the florist's artificial ways of producing monsters, lies the wide "mesa of moderate effort and moderate investment upon which anyone, with a love for it can grow in California through the whole circle of the year, by the square foot or by the acre, flowers to delight his heart, to comfort his wife and educate his children," says Mr. Wickson in the preface to "California Garden Flowers." Again, beginning with the soil, continuing upon fertilizers, tillage and irrigation, every stage of the flower garden is adequately treated. There is a chapter devoted to the chrysanthemums, telling exactly how to dis-branch, dis-bud, prune and water to get any style of flower you wish. Bulbs, water plants and seeds for every condition of sun and wind are carefully described. Every back yard as well as every front yard may be beautiful and livable with a little care at the right time. Add these two volumes to the Christmas shopping list, they will please the active gardener, and inspire the potential one. ("California Garden Flowers," "California Vegetables." Pacific Rural Press, Publisher, San Francisco.)

ADVERTISEMENTS.

"This bloomin' paper's full of ads," Lifelong Subscriber cried, "it's got them on 'most every page and even some outside. They've crowded all the reading out with their insistent pleas, and they are scattered through the pages about as thick as fleas. They each exploit some patent thing to help the work along, or something that they say will make life one exultant song. They argue that you can't afford to pass their products by, and then they limber up and tell you all the reasons why. They're so doggone persuasive that you must be on your guard, or you'll purchase labor savers; and it makes it mighty hard.

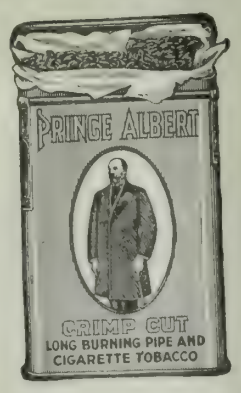
"We've got along these many years in the old-fashioned way; I wonder why they're not content to let tradition stay; why should twine binders supersede the cradles of our dads? Why all this advertising of these new-fangled fads? Why advertise in papers, or in the magazines? Why waste this hard-earned money in pushing new machines? I never got an idea yet from reading all their stuff; I always thought it just a lie, or else, at least, a bluff, I read the jokes wherever found, and all the lover's tales, but I never read the ads, you bet, for there my patience fails."

And the editor took up his pen and this is what he wrote: "I've just perused your letter and its contents all I note. The sentiment therein expressed has caused me some surprise, for the brainiest lads in all the world are those who advertise. They pioneer with progress and they help the world to move; it's they who furnish ideas to force us from our groove; they've always got a better thing to ease our carking toil, and it's advertised machinery that cultivates the soil. And I'd say here in conclusion, that I write a bale of stuff that isn't well considered and is written on a bluff; I oft relieve my system of a lot of cheap advice that is put in circulation ere I've thought it over twice, but the dope the advertisers put in the space they buy, you bet is up to standard, and to it you're safe to tie.—Fruit Grower.

MISCELLANEOUS NOTES.

Arrests of cattle rustlers are reported from El Centro, Imperial county, and Sonora, Tuolumne county.

State Market Director Weinstock was elected vice-president of the National Ass'n of Marketing Officials. Thirteen States have market officials and prospects are that as many more will by next year.

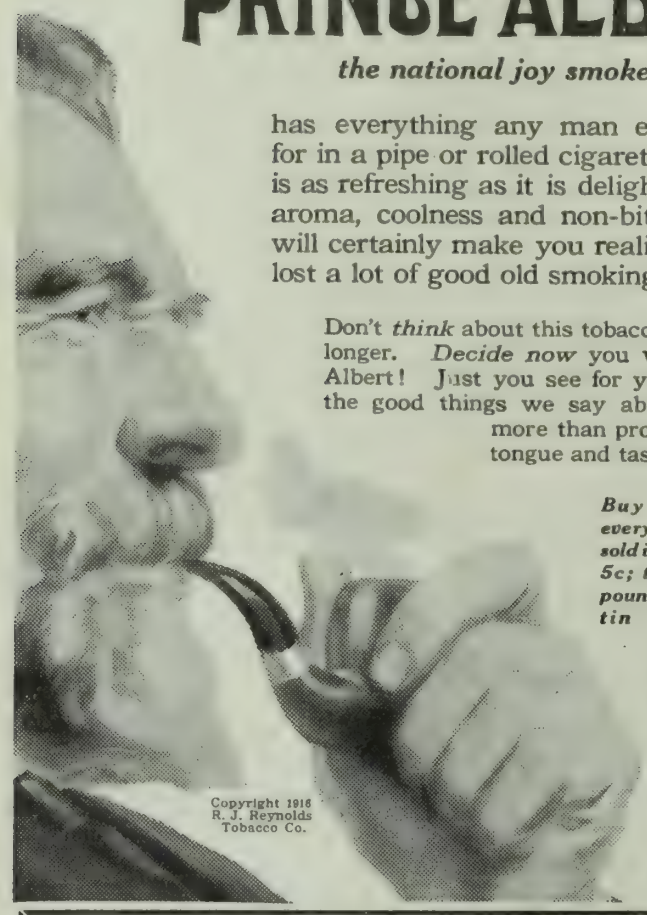


Water rates in Placer county are not lowered by the Railroad Commission, but the company must furnish all that is needed for irrigation. Much of the foothill section has remained undeveloped for lack of water and much litigation is now ended.

The Dairy Cattle Congress will hold its annual exhibition October 9 to 15, 1916, at Waterloo, Iowa. Additional features are a cow-testing association demonstration, a working creamery, butter demonstrations, and a stock judging contest. The Iowa State Dairy Association will hold its meeting at the same time.

Yuba county held a celebration Dec. 10 in honor of their new 2200-foot concrete bridge at Marysville which cost $200,000, though concrete material was taken from the river bed. This was all paid from the direct taxes. They have no bonded indebtedness, but are saving their credit for good roads bonds.

The Western Meat Co. of San Francisco purchased the following fat stock at the Pacific International held at Portland last month: California King, a steer bred and raised by the University of California, 17½ cents per pound; California Hope, raised by the Cal. University, 12¾ cents; the 2nd prize yearling of the show at 11½ cents; 2nd prize carlot of steers at nine cents; 3rd and 4th prize carlot of light hogs at $6.15 and $6.35 a hundred. All of these were disposed of to the holiday trade.



Prince Albert paves the way

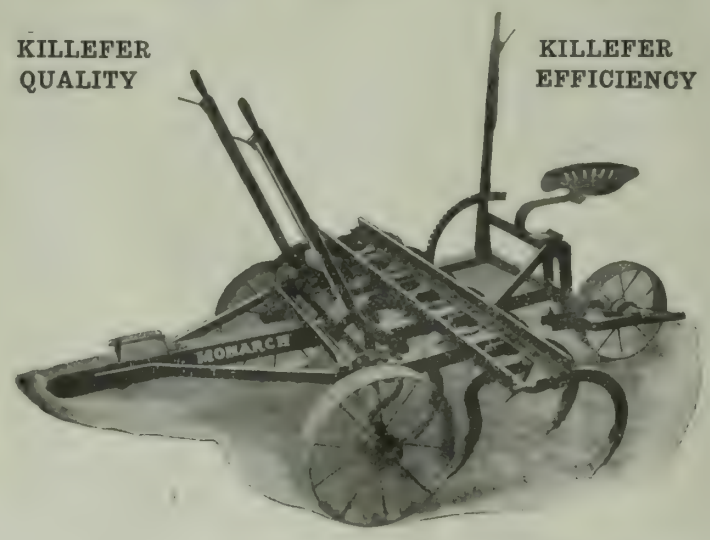
for men to get a new and cheerful understanding of how good a pipe or rolled cigarette can be. If you *think* you can't smoke a pipe or a makin's cigarette; if you are taste-tired, we tell you Prince Albert will bring you back without any fuss or feathers—quick! The patented process fixes that—and cuts out bite and parch!

PRINCE ALBERT

the national joy smoke

has everything any man ever yearned for in a pipe or rolled cigarette. Its flavor is as refreshing as it is delightful; and its aroma, coolness and non-biting qualities will certainly make you realize you have lost a lot of good old smoking time!

Don't *think* about this tobacco question any longer. *Decide now* you will try Prince Albert! Just you see for yourself that all the good things we say about P. A. will more than prove out to your tongue and taste!



Buy Prince Albert everywhere tobacco is sold in toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors and in that classy pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such fine trim.

Winston-Salem, N. C.

Monarch Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Chisel for bean and beet ground before planting, it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.

As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market. Made in 5, 6 and 8-foot sizes.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

Do It Electrically

PACIFIC GAS AND ELECTRIC COMPANY — PACIFIC COURTEOUS CONTINUOUS SERVICE

ELECTRIC APPLIANCES in the household not only add to the convenience of all members of the family, but they are economical and time-savers. **ELECTRIC APPLIANCES** include **CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS** and every other appliance that is needed in the modern home, not forgetting **ELECTRIC FANS.**

We carry these appliances in many of our branch offices, and will be glad to have you call and inspect them. Where we do not carry them we will be just as glad to give you our expert advice.

"PACIFIC SERVICE" is always "At Your Service."

Pacific Gas and Electric Company

HEAD OFFICE, 445 SUTTER ST., SAN FRANCISCO.

Branches in all principal cities and towns of North-Central California.

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices. etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

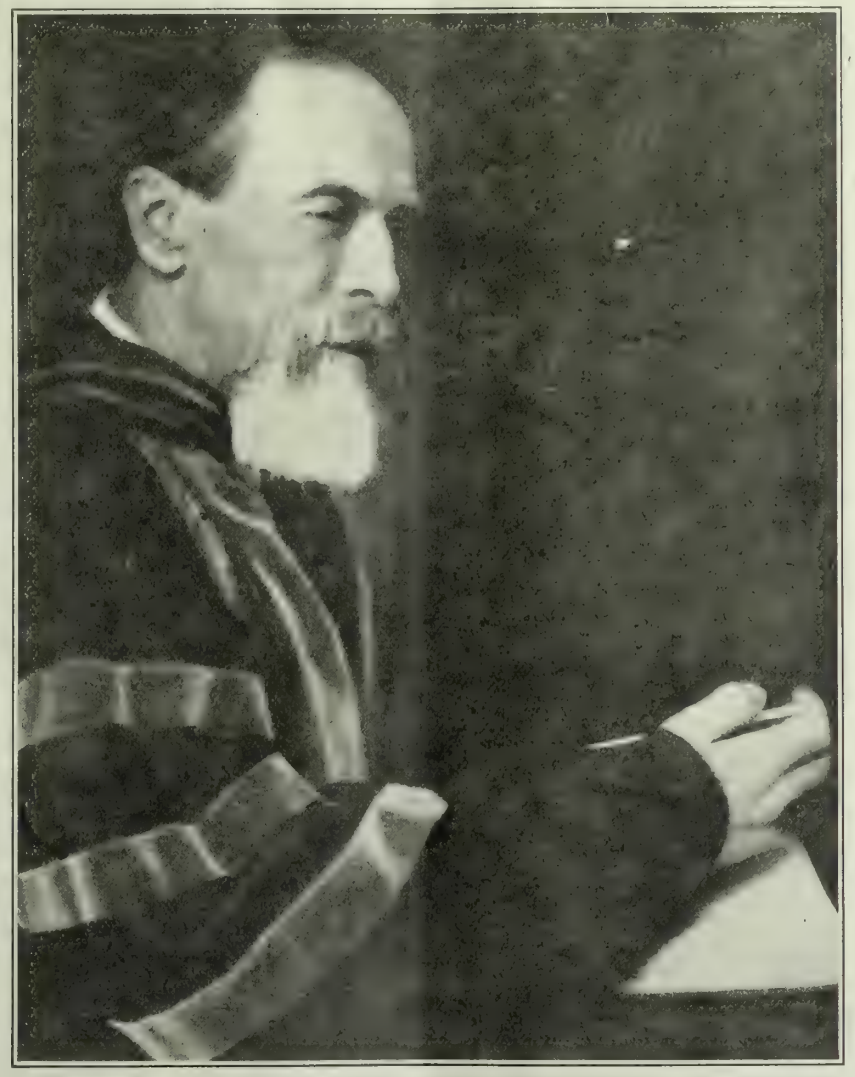
We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

Redwood Manufacturers Co.

1608 HOBART BLDG., SAN FRANCISCO.

Vol. XCI—No. 3 Forty-sixth Year.

THE PACIFIC RURAL PRESS



SAN FRANCISCO JANUARY 15, 1916. LOS ANGELES

California State Library

Demise of Dr. E. W. Hilgard.

Close of a long life of distinguished service to the learning, science and agriculture of California.

ON SATURDAY, January 8, three days after the completion of his eighty-third year, Dr. E. W. Hilgard of the University of California passed peacefully and obediently beyond the veil. From scenes of earth amid which he had labored lovingly, devotedly and with distinguished success during the later and richer half of his lifetime, he went forth to the enjoyment of a life in which he had always held trusting confidence and expectation. The results of his labors are the warp of California's first half-century of intellectual and industrial life and upon such enduring work as he achieved will be spread the splendid fabric of our coming State advancement and development. His mind was richly endowed and carefully trained in learning, both old and new. He possessed notably the creative faculty in thought. He was quick to see his opportunities of public service, to recognize his duty therein and he was masterful and tireless in pursuit of it. He was bold in his conquest of truth and fearless in his use of it for the interests of mankind. His great undertaking was in natural science and its relations to agriculture — seizing gladly the smallest fact from research and pressing it to the humblest service but always perceiving and enforcing the relations of both the fact and the service to the broadest interests of his state and of his fellow men. Thus all came to know him as richly wise, unswervingly true and deeply patriotic and humanistic—a man whose thinking was clear and whose motives were as unselfish as his service of them was forceful and effective. His achievements were great and diverse and his honors therefore great and widely bestowed.

THE LATE PROFESSOR HILGARD.

Father of agricultural education and research in California and founder of the California Experiment Station, the oldest in the United States.

At the moment of his departure the only fact which comes clearly to the mind of this writer is that California has lost a citizen of great achievement and influence, whose monument will be the greatness of his work for California which can never be forgotten because it was so great, so everlastingly sound and true and so closely related to the happiness and prosperity of his fellow citizens and of all who shall come after him. It is most fortunate that he was allowed to approach as near as man ever comes to the completion of his work, and to enjoy the realization of remarkable public advancement along lines which he early discerned, forcibly marked out and labored to deeply impress upon the great institution of whose history his life and accomplishments will always be recognized as an integral part.

It is too soon to undertake analysis or even full sketch of the public services of Dr. Hilgard. That must be attained by thought and circumspection, which may give some approach to adequacy in a tribute to the man and in an estimate of his worth and work. At the moment of his departure an outline of the plainer facts of his life will serve readers best to refresh their memories of him or to measure broadly the scope of his experience and activities, both of which are remarkable. The following is a careful biographical sketch prepared by those who have been longest associated with him and it is believed to be as correct and suggestive as such a brief outline of so rich and long a life can be reasonably expected to be.

Eugene Waldemar Hilgard was born January 5, 1833, at Zweibruecken, in Rhenish Bavaria, the son of Theodore Erasmus Hilgard. He was brought to this country by his parents when three years old, his family settling in Illinois as farmers and sending their son to Belleville for his early education. After his graduation from high school there and service on his father's farm, he returned to Germany to take advanced work in the University of Heidelberg, from which he was graduated with honors and a doctor's degree in 1853. This degree was re-issued to him in 1903 as a "golden degree" in recognition of half a century's good work for science. He studied also at Zurich and Freiberg, in Saxony.

Before his return to this country, Professor Hilgard met and married Miss J. Alexandrina Bello, the daughter of a prominent resident of Madrid, Spain. Returning to America, Professor Hilgard was appointed state mineralogist of Mississippi, a position which he held for six years, and afterward professor of chemistry in the university of that state, then professor of geology, zoology and botany. He left Mississippi for Michigan to take a position on the faculty of the University of Michigan, but remained there only two years, when he was called, by the Regents of the University, to California in 1875.

The college of agriculture of the University of California, though considered the real nucleus of the university, was in an undeveloped state, and upon Professor Hilgard was thrust the task of bringing it up to the high standard which he held in educational affairs. It

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., January 15, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	4.18	18.33	19.10	52	34
Red Bluff	.28	12.26	11.31	50	30
Sacramento	1.35	10.35	8.08	54	34
San Francisco	2.18	14.02	9.50	56	38
San Jose	1.04	8.98	6.97	56	30
Fresno	.55	5.06	4.13	58	32
Independence	1.42	4.19	4.09	50	—
San Luis Obispo	2.60	11.29	7.53	58	34
Los Angeles	1.12	6.70	6.00	64	40
San Diego	.68	3.74	3.79	60	44

THE WEEK

Things are surely continuing to come California's way. Rains have again fallen copiously and over wide area. Temperatures have been a little sharp here and there, but so far have dropped where there was nothing tender to hit, and it is getting late for injurious freezing. All seasonable soil-working and planting are progressing toward what now promises to be large production.

Other things are also coming California's way. A committee of the U. S. Senate has made a report favoring equal suffrage, and the national government is now up to the issue which California has settled so satisfactorily. It seems to us a little trite to argue for equal suffrage when our experience has given a demonstration which is beyond argument, and yet it may interest some to see how the old argument looks in print again. This is a part of it:

"Women comprise 50 per cent of our population. They are citizens in all other respects. Together with the men, they constitute the people. In patriotism, intelligence, devotion to welfare to the government and in capacity for franchise, they are in nowise inferior to men. Neither logically nor justly can unlimited suffrage be recognized as an essential to our republican form of government and its existence at the same time be limited to one-half of the people, arbitrarily segregated from the other half by the accident of sex."

Does it not sound like a story from the first reader to a Californian? But California has other bright and sweet things than women—though we suppose our words are an affront to the might of citizenship. California has a larger variety of birds than any other State in the Union, according to investigations by Professor Joseph Grinnell of the University of California. There are 541 distinct species of winged travelers in California and among them are, he says, most interesting sorts. He points out that the State of Texas, two-thirds as large again as California, has not nearly so large a variety of birds as this State. And it should be remembered that we are similarly rich in bugs and in plants. Man is not the only organized life which knows California for a good thing.

Dairy Cow Contest Postponed.

The opening of the Dairy Cow Contest, of which announcement was made in our issue of December 25, has been postponed until November 1, 1916, as the result of protests filed against its beginning on January 1, by the California Cultivator and the Live Stock and Dairy Journal. The facts leading up to this regrettable circumstance are as follows: The Pacific Rural Press, recognizing that more productive cows are a fundamental need of dairy development and prosperity in this State, and honestly desiring to assist in the wider attainment of such animals in dairy service, proposed to Prof. F. W. Woll that he undertake in California such a State-wide cow-contest as he had previously carried to great success and wide influence in Wisconsin. The effort commended itself to him and to Prof. True, the head of the Animal Industry Division of the University—the clear understanding being that this journal should have no advantage in publication, and the announcement of the contest must be sent on the same date to all agricultural journals, for such use as they saw fit to make of it. This course was followed and the announcement appeared in the Pacific Rural Press and the Pacific Dairy Review and in some of the general newspapers, stating the terms of the contest and offering a fine lot of awards, contributed by those who desire greater progress and prosperity for the dairy industry. We understand that the California Cultivator and the Live Stock and Dairy Journal filed protests against the undertaking with Dean Hunt of the University. We have not seen them, but they are supposed to object to the proceeding on the ground that the initiation of the idea, as well as the formal offering, was not announced by the University to all journals that they might have the same chance to engraft themselves upon the idea as well as to announce the growth upon it. Dean Hunt considered the matter judicially and patiently, and concluded that, as the University had not formally and officially made the announcement, the contest could not proceed in the name of the University. For this reason the opening of the contest was postponed until November 1 of the present year, and all who had made contributions to the awards will be requested to renew them for that date.

What We Think of the Facts.

Thus we have endeavored to make a clear statement of unfortunate facts without reflection or impugnment of motives. The facts show that by appeal to a technicality our contemporaries have succeeded in taking the edge off an undertaking in cow-testing which would have awakened and stimulated all dairymen to fuller appreciation of what kind of a cow is worth feeding; which would, by comparison with the great dairy State of Wisconsin, have shown where California cows actually stand as profit-producers and would have set up local standards of cow-production, which all could be effectively exhorted to work towards or away from, as the case may be. The action of our esteemed contemporaries could not kill the progressive initiative upon which the contest was proceeding, but they have delayed it and thereby practically lost a year in the pursuit of a desirable and honorable enterprise. This time these protesting journals can probably profitably employ on explaining to some of their friends who generously and enthusiastically supported this proposition, which promised so much for dairy progress, why they caused them to lose a year in building their business toward greater satisfaction and reward.

We do not enjoy writing this way about anybody, but we cannot allow such a narrow and selfish interference with work which is good for the State to go unrebuked. As we recently wrote in another connection: "Agricultural journalism is a game that must be fairly played; the public hates anything which is unsportsmanlike." We are conscious of having done in this connection nothing which is unfair or unjournalistic. We put up a proposition for the good of the dairy industry and of the State. It was the public duty of other journals, holding ambitions and purposes like ours, either to let it alone or to support it in their own way, and to get for themselves the rewards of honorable effort and enterprise—as we were doing and have a right to do. Or, better still, they might have drawn from the open field of thought and knowledge something better than we could think of, for us to admire and imitate. Failing to do any of these things, they had no journalistic right to "throw in a monkey-wrench and stop the machinery" of progress. For this kind of "enterprise" they have the public to settle with.

The Prune-Growers' Convention.

Ample announcement is made on another page of this issue of the State-wide convention of prune growers, called to meet in San Jose on Wednesday, January 19, at 2 p. m. Growers from a distance should find the Chamber of Commerce and learn the place of the convention, which, we presume, will depend upon the numbers to be accommodated. We continue to call it a "convention of prune growers," although the committee has decided to graft on the apricot. That will be done, but just at the moment it seems to us to have more weight when we consider it a special effort of the vastly greater prune interest of the State. The convention will give the undertaking a business and a name which, of course, we shall accept and promote to the best of our ability. At the meeting in San Jose last week there was much written assurance of participation from outside districts, and many delegates from local groups of growers will be present. As the time is short for local meetings to name delegates, we hope there will be a large number of individuals present on their own initiative, so that the State will be widely represented. All such participants can lead in local organizations later. It seems very desirable that torch-bearers should go out from this convention into every neighborhood where prunes are grown. It will be seen by the announcement on another page that the movement is approved by the Grange and the Farmers' Union. This is important. All organizations dealing with producers' co-operation should take part in the convention. Some of them are already doing great things with prunes, and surely the convention will welcome everyone who has succeeded in getting

rid of a pound of prunes with profit to the producer. All probably do not know how much is already being done by sales' agencies organized in the growers' interest. Take for instance, the work of the Farmers' Union, of which Mr. Breton, of that organization and also of the Prune Growers' Committee of 1915, gives us these interesting facts:

"Let me recite briefly what the California Farmers' Union is doing and has done, so far as Santa Clara Valley is concerned. Up to 1911 the packing of Union Seal prunes was done in rented houses. In that year the members around Morgan Hill put up a packing-house; in 1912 the members around Campbell built a packing-house; and in 1915 the members around Gilroy and Rucker did likewise. Each of these houses cost in the neighborhood of $11,000. Do you need any further evidence of the growers' willingness (when the right proposition is put up to them) to reach down into their pockets and bring their hands up with a substantial quantity of gold to better their condition? We have found them willing and ready to support with both money and product."

No doubt other growers' organizations have also done well, and if we had the facts we would like to recite them in this connection. Our idea is that all good organizations now existing must be built into the general structure—whatever nature the convention will determine for it. All rivalries, if there be any, must be merged into a general cordial and influential co-operation, if there is to be any such attained. It is a great problem to do this, and it may take more time and experience to reach such a result as we hope for, but the place to begin is in San Jose, and the time to begin is Wednesday, January 19.

Caught on Their Own Prickles.

It is pretty well known, we presume, that some of the spineless cactus which has been unloaded on the public is hardly smoother than the rough side of a porcupine, and some losses have accrued to purchasers thereby. To such it may be some consolation to know, according to a writer in the Oakland Tribune, that those who unloaded such stuff on them were caught on their own prickles. This is the story as we find it:

"It seems a cactus corporation was formed when the general Burbank enterprise was launched, and the stock put upon the market. The public took hold of the offering with avidity. The stock met with such ready sale that the promoters were led to think they had made a mistake in offering it so freely, and they began buying it back. They are reported to have reloaded with large blocks, at prices considerably in advance of those which they received on the original sale. As has been seen, expectations were not realized. the cactus boom was not permanent; and this is perhaps the only known instance of boomsters falling for their own boom."

And it all comes from the credulity of people who seem never to be so happy as when rushing into things which they do not understand.

California's Crop Values.

As an indication of agricultural prosperity in this State, the following figures, taken from the San Francisco Chronicle's annual edition, are of interest: "The total production for the year 1915 of agricultural products had a value of something like $479,000,000. Estimates of crop yields are: Wheat, 7,040,000 bushels; barley, 39,440,000 bushels; oats, 7,700,000 bushels; oranges and lemons shipped during the year ending August 31, 1915, reached 47,659 carloads; prunes, 175,000,000 pounds; raisins, 120,000 tons. Crops of corn, rice, oats, alfalfa, sugar beets, beans, hops, almonds and walnuts all showed substantial gains over 1914."

Queries and Replies.

Querists must give name and address.

Driest Land Pasture.

To the Editor: What kind of grass would you sow for pasture on uplands on the west side of the San Joaquin valley which has always been used for pasture? The soil is deep sandy loam, one hundred feet to water. What do you think about sudan grass for such a place?—W. T.

The region you indicate is one of scant and uncertain rainfall and the soil non-retentive. Under such conditions we know of no perennial grass which will hold life in the root through the dry season. Probably it must still be used for wild pasture unless you can get irrigation water. Natural winter growth of annual plants, winter-pastured green and used for dry feed later, the growth reinforced by fall scattering of wild oats, bur clover, filaree—so far as you desire to invest in that direction to cover the land better with winter growth. Do not overstock, and give the plants a chance to ripen some seed early in the summer before dry-feeding. Sudan grass does not appeal to us in such connection. It cannot stand frost, therefore cannot use any surplus winter moisture there may be and we should expect the summer growth to be scant. However, has any one proved it good on such dry land?

A Guess at a Cherry Trouble.

To the Editor: We have grafted our cherry seedlings in December, January and February and in all cases the buds swell and break and look fine. One would think that it would be a 100 per cent stand. Then when warm weather comes on they begin to die and we get only about 50 per cent. What is the cause? Some think when the buds swell they fill with water and drown.—J. W. R., Sebastopol.

We can only guess at it and our guess would be that the granulating process is prevented or destroyed by excessive sap-flow, there being no top to take most of it. We should run a tree-digger under the row and cut off a lot of the seedling roots or else graft in March or April (in your rather late district) after the roots have shot much of their first flow of sap into the old top before its removal. We should try the root-pruning first, for grafting so late might conflict with other pressing spring work. Besides cutting off the long seedling roots will make your stock better for transplanting next winter. Why did you not bud this stock last August instead of holding it over for grafting?

When is Soil Right to Work?

To the Editor: I wish to call your attention to the fact that of all the agricultural articles I have read I have never yet seen a paragraph describing the proper moisture condition soil should be in for plowing and other working. Perhaps you will give your views. My own idea is that the soil has the right moisture when it does not stick to the tools—barring San Luis Obispo adobe, which is a corker, take it any way you have a mind to.—James Cass, Cayucos.

You have put about all the wisdom there is in that paragraph. If a man can keep his tools bright he will not be taking the soil at its best, but will be doing the best with the power he is using. But he should be at it just as soon as it will keep the tools bright and not long afterwards—because it is at the beginning of the brightening condition that the soil will crumble best. Our rule excepts sticky adobe, just as your rule does, and adobe is just right when it is a little too wet—that is for the plow. The harrow works best when it dries out just a little too much for the plow. You do not see this in print because, after you have printed all the rules you can think of, it is a matter a man has to learn by experience.

Legumes Growing with Grain.

To the Editor: When should cowpeas be sown with oats? Could they be drilled in, when the oats have started? At what rate? Do they increase the yield of crop, and value of the hay?—H. T., San Luis Obispo.

Cowpeas will not serve you with oats because cowpeas will not make good winter growth, such as you expect to get from oats. They do not endure frost. Common field peas or vetches are the legumes for you to sow with oats. They should be fall sown with the oats; they would probably be smothered or dried out by oats which have that much the start of them. It is usual to sow about half as much by measure of peas as of oats either in drilling or broadcasting. Dr. Lipman tells us that it is fully demonstrated that the legume does feed the grain while both are growing together. The hay is improved by the increase of the protein content, contributed by the legume.

Allowing Peaches to Go Unpruned.

To the Editor: Owing to unusual circumstances it will be rather difficult to get my peach orchard pruned and would like your opinion as to whether or not any harm would be likely to result to trees or next crop if it were omitted this season? The orchard is in Yolo county, eight years old, has heretofore received good care and produced average crops. The soil is a deep loam, orchard is not irrigated, the rainfall averages about twenty inches and last season the trees made a very good but not excessive wood growth, the variety being Muir.—Subscriber, Woodland.

It may be done and in fact is done too often—and yet the peach is of all fruit trees most likely to be injured and to have its life shortened by such neglect. If you allow the tree to set fruit on all the new wood grown last year, you will be obliged to spend much money in thinning to make the fruit of salable size and to protect the tree from breaking badly. Besides, if you allow the tree to over-bear such a mass of worthless fruit, you face the chance of getting less fruit in 1917 and of impairing the thrift of the tree. Probably the crop of 1916 can be made profitable by pruning for less money than by thinning, propping, cross-tying and other work which may be necessary to save the trees.

"Chul" Wheat.

To the Editor: Can Chul Wheat be grown in the San Joaquin Valley successfully or not? I have been told it was a very good wheat for dry farming, as it doesn't rust and will stand the drouth.—R. T. M., Richgrove.

It is such a hardy wheat as has been described to you, but millers, we understand, still do not like it, although it was hoped they would come to using it. If this is generally the case the wheat has to go for feeding purposes. Has any one experience otherwise?

The Prune Growers' Convention.

[Written for Pacific Rural Press by the Editor.]

NOTICE TO PRUNE AND APRICOT GROWERS:

Remember that the mass meeting of January 19th, 1916, at 2 p. m., in San Jose, is your meeting, and your attendance is necessary to full success of the meeting.

Growers from districts outside of Santa Clara Valley specially invited. J. H. BONE, Chairman. H. O. H. SHELLEY, Sec

Preparations for the convention called by the Prune Growers' Committee of Santa Clara county to give opportunity for the organization of a State-wide association are progressing actively. At the meeting of the Committee in San Jose on January 5 which the writer had the advantage of attending by invitation, the keenest interest was manifested and the committee was most harmonious and actively interested. It has been decided to include in the invitation to the convention those also who are interested in apricot growing and curing. We give below the official announcements by the committee which all interested should accept as a cordial invitation to take part in the coming convention.

A General Statement by the Prune Growers' Committee.

In May of last year it became known to the Growers of Santa Clara county that the packing interests had sold a thousand cars or more of prunes at 3½c and that a number of growers had already sold for this price and some for less. Also that apricots were being bought at 6c.

In support of these low prices the packing interests claimed an immense crop of both these fruits in Santa Clara Valley and further that there would be no export trade in 1915 owing to the European war. Both of these claims have proven erroneous.

A mass meeting of the growers was held in San Jose's Chamber of Commerce rooms at which twenty or more districts in the valley were well represented.

The meeting developed the fact that there would not be more than 70,000,000 pounds of prunes and only 65 per cent of the 1914 crop of apricots. Prices for the latter in 1914 averaged to the grower 10½c.

These estimates proved larger than the actual crop results.

The growers unanimously agreed to hold prunes for a 5c basis. Apricots were considered worth 8½ to 9c.

Upon the suggestion of Mr. J. O. Hayes of the San Jose Mercury a representative from each district was selected to constitute a Bureau of Information and make semi-monthly reports on market and crop conditions as a guide to the growers and hold prices to a living basis.

Prunes ultimately went to 5c and the bulk of the apricots sold at 8 and 8½c, thus saving to the growers a million dollars or more.

This committee now called a mass meeting in San Jose, January 19th, at which it is expected that Col. H. Weinstock, State Market Commissioner, and Professor Wickson will be present, for the purpose of proposing to the growers that a State-wide organization be formed as a means of protection from speculative packing interests, to furnish accurate information relative to crop and market conditions, and finally, if necessary, to provide their own selling agencies.

It is only justice and equity that the growers should know from their own organization what is a fair price for their products and aid in getting it.

We invite the growers of your district to send representatives to this mass meeting, but if you are unable to do this, get together, discuss the matter among yourselves, and get in touch with the Santa Clara County Prune and Apricot Growers' Committee at an early date.

Jos. H. Bone,
Chairman of Committee.

The Official Invitation.

A meeting of the Prune Growers' Committee was held Jan. 5, 1916, to consider the work of the past season in its relation to the mass meeting of prune and apricot growers to be held Jan. 19 at 2 p. m. and they request the growers to remember the date.

Endorsements by the Grange.

The San Jose Grange at their meeting on January 8 adopted the following:

Resolved, that San Jose grange endorses the work of the 1915 prune and apricot growers' committee, and

That they form an organization of a state-wide association as a means of protection from speculating packing interests and furnish accurate information relative to crop and market conditions.

Santa Clara Pomona grange at a meeting on January 8 adopted the following:

Resolved, That Santa Clara County Pomona Grange endorses the work of the 1915 prune and apricot growers' committee and favors an organization of growers to be state-wide for the following purposes:

Protection from speculative packing interests;

To furnish accurate information relative to crop and market conditions, and any other information of service to the growers.

Further, That the secretary of Pomona Grange be instructed to advise the local granges of the adoption of this resolution and that they be requested to give publicity to the mass meeting, January 19 and insure its success.

Approved by the Farmers' Union.

D. M. Utter, president of the State Farmers' Union, has given Chairman Bone assurance that they will give the movement their hearty support.

EGYPTIAN CORN AS SUMMER FORAGE.

The possibilities of sorghum as a stock food have been set forth in these columns many times and yet the acreage is not so great as past experience would warrant, especially for a summer forage on dry farmed land.

On the T. D. Carneal ranch in Contra Costa county a three-acre field is set aside each year for Egyptian corn to be fed as a soilage crop to the dairy cows and beef calves.

No irrigation is practiced, the ground being prepared as soon after the winter rains as possible and then kept well cultivated during the summer and fall months.

As soon as the first growth has reached a height of two and a half or three feet, cutting is started on one side of the field, the practice being to cut the stalks close to the ground in sufficient quantities to supply green feed for each day. By the time the patch is cut over once in this manner the first cut portion is again high enough to be cut. Three crops a year of the green fodder is harvested in normal years in this way, furnishing green feed during a portion of the year when the balance of the ranch is dried up with the summer heat. Good cultivation seems to be the chief requirement in growing the crop on Mr. Carneal's ranch.

LIME FOR BROWN MITES?

[Written for Pacific Rural Press.]

Brown mites are mostly on tops and sides of the twigs, according to J. H. Davis of San Joaquin county. He has noticed more on the Robe de Sargent than the French prunes beside them. He also noticed that while they were thick on part of his orchard, there were practically none at all in the orchard of J. H. Clancy just across the road.

Mr. Clancy sprays only once a year, using whitewash and salt in February. Forty pounds of lime and 2 or 3 pounds of salt, which is used to make the whitewash stick, are mixed with 200 gallons of water and applied with a power sprayer with two lines of hose. Big nozzles are used because, as Mr. Clancy says, it is cheaper to waste whitewash than labor. It requires a little over 200 gallons of spray per acre and two hours to apply it. The cost of two men and a gentle team, beside gasoline and depreciation of the outfit, are figured at $8 per day. A whiteish tinge on the trees a year after the whitewash was applied in January or February, 1914, shows that it sticks well. Who else has observed the effect of whitewash on brown mites?

TREES SET TOO SOON AFTER DYNAMITING.

[Written for Pacific Rural Press.]

Trees very often die when set in holes recently dynamited. Three years ago in February, J. G. Williams of Santa Barbara county shot about 250 holes and planted Royal apricots directly. He has a sandy somewhat drainable "hardpan" about 2½ feet under the surface of the loamy bench land. The trees did very well the first year, in which there was but little rain.

The winter of 1913-14, however, was wet enough to soak the ground, and many of the trees settled as much as a foot. Early in spring, but possibly after the sap had started, these trees were replanted. Most of them died. Others settled some but were not replanted. They lingered along and died, so that new trees are to be reset in their places this spring. Use of this land has been lost for three years, and the new trees will be that far behind what they might be. Dirt that requires blasting is usually loosened in chunks between which are air spaces which will dry them and the roots unless settled thoroughly by time and water.

HUDSON SUPER SIX TRADE NAME REG

$1375 at Detroit

7-Passenger Phaeton—$1375 at Detroit

We Now Present the

Patented by Hudson
December 28, 1915
Patent No. 1165861

Hudson Super-Six

76 Horsepower—an Added 80% Without Any Added Size

These Stock Car Records Officially Broken

The Hudson Super-Six—7-passenger touring car model—at Sheepshead Bay Speedway in November, officially broke all stock car records up to 100 miles. Also all records for quick acceleration, under American Automobile Association supervision—as follows:

100 miles in 80 minutes, 21.4 seconds, averaging ***74.67 miles per hour,*** with driver and passenger.

The previous best record was made with driver only, with a larger motor and more cylinders.

75.69 miles in one hour with driver and passenger.

Standing start to 50 miles per hour in 16.2 seconds.

Mark what those records mean.

No other stock car in history has equalled that performance. No other like-size motor has ever developed such power.

The Super-Six has proved itself the greatest engine ever built. It has outrivaled Eights and Twelves. It has almost doubled the efficiency of Sixes.

And this motor is a Hudson patent, found in Hudsons only. So it means that Hudson cars hereafter hold the highest place in Motordom.

80 PER CENT MORE POWER

Let us compare it with the Hudson Six-40, long the leader among Sixes. That Six-40, by its matchless performance, in two years quadrupled Hudson sales.

The Super-Six is identical in size. No added cylinders, no extra complications. Lightness and economy remain.

But the Super-Six develops 76 horsepower. Best earlier type sixes of like size developed but 42 h. p.

And all that increase—that added 80 per cent—comes through wiping out vibration.

ADVANTAGES OF HIGH POWER

You ask why you need that 76 horsepower if you don't care for high speed.

You need it because it means vast reserve power, to mount hills without effort, to make hard roads easy, to avoid changing gears. Also it enables you to creep on high gear, and to pick up with record quickness.

And it all comes through lack of vibration. So it brings with it bird-like motion. The motor is so smooth that the car seems to move by magic.

OTHER TYPES DISCARDED

We stopped production on former Hudsons when the Super-Six proved this supremacy. Thus we lost over $6,000,000 in sales last fall. We also stopped our experiments on Eights and Twelves.

Then we doubled our factory to meet a doubled demand. And we bought materials for $42,000,000 worth of these new cars for this season.

All because the Super-Six is bound to dominate hereafter. Its performance is resistless. Any buyer of a high-grade car will choose it when he knows the facts It will also win thousands from lower-grade cars to the Hudson.

A LUXURIOUS CAR

The Super-Six looks its supremacy. In every detail we attain luxury's limit, regardless of the cost. The new body lines are perfect. The finish is superb. In the upholstery we use a rare grade of grain leather. Each compartment of the Phaeton has a rounded, finished dash.

At no price is it possible to offer more of luxury and beauty. Yet our mammoth production brings the price to $1375. That for a car which must be conceded the greatest car built today. Go see it at the nearest Hudson Showroom.

Spray for Apple Mildew.

To the Editor: Some of my apple twigs last spring were covered with white furry stuff and the leaves were stunted, dying shortly after they started. They were the same way the year before but not quite so bad. —J. L. B., Stonyford.

Your trouble is powdery mildew which winters over in the dormant buds. That is why the leaves are dwarfed and dying so early in the spring. Sulphur more finely divided that you can obtain in flowers of sulphur is the remedy. This may be obtained in commercial forms as atomic sulphur or milled sulphur, or it may be prepared at home into the form of finely divided sulphur obtained in a mixture with iron sulphide at a cost for material of about $1 per 500 gallons of spray as recommended by W. H. Volck of Pajaro Valley. It is applied just before the buds unfold in spring or often combined with arsenic sprays for codling worms just after trees are in full bloom. The stock iron sulphide mixture is prepared as follows, beginning at least two or three days before spraying begins. It will keep indefinitely. When ready for use it is diluted to make 500 gallons of spray mixture.

Suspend 10 pounds of iron sulphate (copperas) in a sack near the surface of the water in a 50-gallon wooden barrel about two-thirds full of water. When all this is dissolved, measure 2¼ gallons of 33 degree B. commercial lime-sulphur or 2 gallons and 3 pints of 32 degrees or 2 gallons of 35 degrees lime-sulphur. Pour all but a quart slowly into the barrel, stirring it vigorously with a hoe or shovel. Let it settle a few minutes, then dip out with a glass or cup, a little of the clear liquid at the top. If there is no yellow lime-sulphur color, it means there is some copperas not yet combined, so a little more lime-sulphur must be added, stirring well. As a thorough test for this, pour a drop of lime-sulphur into the glass of liquid; and if it produces some more settlings, pour about half of the remaining quart of lime-sulphur into the barrel, stirring well, and then let it stand. Test it again and again in this fashion until a pale yellowish tint shows a very slight excess of lime-sulphur. Fill the barrel with water and stir vigorously, then let it stand a few hours. The settlings will fill it one-third or half way up. Tip the barrel and pour off the top liquid, but do not pour out any of the settlings. A spigot in the side of the barrel half way up will save considerable work. When most of the top liquid has been emptied, fill the barrel again, stir it, and let it stand, and pour off the liquid, repeating the process until it shows no yellowish tinge, at which time all the excess lime-sulphur will have been washed out of the settlings. This may require three or four washings. Then fill the barrel to exactly 50 gallons and this will be the stock solution. When ready to spray, dip out 20 gallons after stirring well and dilute it to 200 gallons for a spray tankful. Double this much dilution will be nearly as satisfactory if specially thorough application is made and repeated about 10 days later and twice more at intervals of three weeks.

WALNUT TREE RECORDS INDICATE DRONES.

[From address at State Fruit Growers' Convention, Visalia, by Dr. L. D. Batchelor, U. of Cal. Citrus Expt. Stn., Riverside.]

Many of the new walnut varieties of the future are doubtless growing in obscurity among the vast seedling orchards. Every walnut grower should be on the lookout for meritorious trees. Too much importance should not be given the superiority of solitary or "door-yard" trees as they frequently have a decided advantage over the individuals competing with each other under grove conditions.

Individual tree production records kept for a number of years, will not only enable the observer to locate superior trees, but it will also serve to locate the habitually low producing trees. These latter are contributing factors which have kept the average production for the State below 1000 pounds per acre. Many of the old seedling orchards need thinning out. The removal of the lowest yielding trees to the extent of about 25 per cent of the orchard would likely increase the eventual production per acre. Thinning out an orchard on this principle would leave a rather spotted, uneven planting, but if it raises the production it certainly is worth considering. The removal of low yielding trees should be based on at least two, and preferably three, years' records as some trees have a tendency to bear alternate years. The present year's record of 105 seedling trees in a well cared orchard in Orange county will serve to illustrate the point of varying productivity.

Five trees produced between 0 and 25 lbs., 17 trees produced between 26 and 50 lbs., 30 trees produced between 51 and 75 lbs., 24 trees produced between 76 and 100 lbs., 12 trees produced between 101 and 125 lbs., 6 trees produced between 126 and 150 lbs., 5 trees produced between 151 and 175 lbs., 3 trees produced between 176 and 200 lbs., 3 trees produced between 200 and 225 lbs.

The average tree production in this orchard was 84 pounds or 1428 pounds per acre. The twenty-two trees which produced 0 to 50 lbs. took up practically as much room and competed with the heavy producers for moisture, plant food, and light, yet they were not producing enough to pay the interest and taxes on the land they occupied. The removal of such light yielders would give more root and air space to the profitable trees and doubtless increase their productivity. The average production for a period of years should be the guide in eliminating drone trees.

Winter orchard spraying is already beginning in Alameda county.

WALNUTS!

Thrips Spoiled Many Crops Last Year.

[Written for Pacific Rural Press.]

"Thrips cannot injure fruit buds until the petals open wide enough to allow the insects to squeeze themselves in. They have no boring apparatus and no other way to reach the embryo fruit, so long as the bud petals are rolled tight," says B. Anderson of Contra Costa county.

"There is a particular time in which to spray for thrips; and if you miss that by as much as three days, so that some of the petals are partially unfolded, you lose that portion of your crop.

"I keep close watch on my orchard from the middle of February all through March, and when I see any thrips at all on the outside of the buds, I wait until they are just beginning to loosen up and then there is some rush spraying, thoroughly done. I wait as long as possible because the insects are emerging from the ground all the time, and I want to get all that I can at the first spraying.

"I absolutely lost my crop of pears five years, and prunes three years, until I would have been broke except for income from other sources. That was because the University and the Government told me that nothing could be done for the thrips; that they spent practically all their lives in the ground; and that when they did come onto the tree, there was no avoiding them. I was discouraged, but I couldn't afford to pull up my pear and prune trees, so after going to the University, to the Government men, and to the State Horticultural Commission, after many rebuffs, Mr. Briggs of the California Development Board called a meeting of the growers of the State, in which railroads and canneries were also represented. Contra Costa county was losing fifty to two hundred thousand dollars a year by thrips, and Santa Clara county was nearly as bad. This reduced the traffic of the railroads and the output of the canneries, too.

Politics Necessary.—"Everybody told us it was silly to waste money on such a hopeless case, so we decided the way to get rid of the thrips was to go into politics. Congressman Perkins deserves the commendation of every fruit grower in the State because he got behind the movement for a thorough investigation of thrips, and used his influence as Chairman of the Senate Finance Committee to prod the U. S. Dep't of Agriculture into a scientific study of the question. They finally did send several men to various parts of the State and gave thrips a thorough study, which showed what I had already observed in regard to entering buds, and also that two or three thrips in a bud can kill the fruit if they stay there a week or so as thoroughly as a hundred thrips could in a day. A small number of thrips in an orchard doesn't mean that spraying should be abandoned, for it is merely a matter of a few having plenty of time, or many having a little time.

Emulsion Spray Necessary.—"The first spraying for thrips is to kill the adults, which have oily bodies and must be treated differently than most other insects because a water spray will roll off from their backs like it would from a duck. Distillate emulsion spray is necessary to spread the nicotine that kills them, and to make it stick to the insects and penetrate their breathing pores. I now use a commercially prepared 85 per cent distillate emulsion made with whale oil soap and oil at about 30 degrees B. per 200 gallons of spray with a pint of nicotine added. That amount of distillate is pretty strong and possibly three gallons would be safer. I could make the emulsion myself a great deal cheaper, but it is not worth while because we buy it through our local Fruit Growers' Association in large quantities from Balfour, Guthrie & Co., and I use only 10 or 15 barrels a year, and I'm getting too old or lazy or rich, or something.

"In mixing the spray, the tank is nearly filled with water and the distillate emulsion added very slowly with the agitator going full speed. This is very necessary because if the emulsion is not perfect, it doesn't do any good, and you might as well apply the oil and water separately. A pint of Black Leaf 40, which costs about $1.35, is added to the 200 gallons of spray, and the whole mixture kept in agitation during the spraying.

"I wouldn't advise the use of the same spray on prunes because I tried it once and lost the crop and the leaves, too, right up to the last tree that I sprayed. But the pears take it all right.

Second Spray, for Larvae.—"This first spraying does not get all the thrips because they are emerging from the ground all the time and they lay their eggs, which hatch after about eight days into oily larvae. The eggs are laid in holes punctured into the veins of the leaves. I have watched them hatch under a microscope. They wiggle until they get loose and are then about as big as a needle point. They grow pretty fast, and in a day or two are about as big as a pin point, and after a while we can see them with the naked eye. These larvae, and the old thrips, too, seek the protection of the folded leaves and stay there until the leaves open out, after which time they may be killed by spraying again. Last year our second spraying was done about the middle of April, but the proper time is before many of them have dropped and gone into the ground. The best way I know how to tell when to spray the larvae is when I can't find any adults, but in order to catch them before many get into the ground, I spray shortly before all the adults are gone.

Combines Thrip and Codling Sprays.—This spray is the same as the first, but I add ten pounds arsenate of lead to kill the codling worms with the same spray, and thus save a lot of work. The pears are at this time as big as the end of your little finger, and arsenate of lead properly applied gets practically all of the worms. It is poured into the spray tank just before the nicotine is added.

Power Sprayer Necessary.—"One thing about it, you can't keep your pears clean either of thrips or codling worms with a hand sprayer because a man pumping all day gets tired and lets the pressure go down. A power sprayer is the only thing that will keep up the pressure and agitate the mixture enough to make it safe and effective."

Dr. Howard S. Reed of the University of California Citrus Experiment Station gave a talk before the Hemet Fruit Growers' Association, Jan. 6th, on the subject of the Fundamental Principles of Pruning. The address was received with much interest. If fruit growers were thoroughly conversant with the principles involved in pruning trees, they could readily adapt the application or practice to their local conditions.

The Alpha Automatic Spray Outfit

Fitted with 2 in. or 2½ in. Automatic Duplex or Triplex Pump Equipped with the New Mechanical

Automatic Pressure Governor

Which Insures Safety, Secures Uniform Pressure and Eliminates Unnecessary Wear. No Relief or Diaphragm Valve Required. Top Guard Rails Fold Up or Can Be Quickly Removed. Gear or Belt Driven. Brass Fitted Throughout.

THE TWO ESSENTIALS IN A POWER SPRAYER are a thoroughly dependable engine of ample horsepower and a positive and reliable pressure regulator that will insure uniform pressure and eliminate unnecessary wear.

THE AVERAGE SPRAY IS EQUIPPED with a cheap engine and a make-shift pressure relief valve or diaphragm which is exposed to the corrosive action of the spray material which soon puts it out of commission.

THE ALPHA AUTOMATIC PRESSURE GOVERNOR with which the Alpha Spray Outfit is equipped is a simple arrangement of a combined lever and spring on each plunger connecting rod which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.

THIS INSURES SAFETY, secures uniform pressure, and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical; thus making it impossible to run the pressure up to the danger point.

THE POWER PLANT depending on the size rig is either a 2½ H. P. or a 3½ H. P. Alpha Engine equipped with a "built-in," gear-driven, positively timed magneto, requiring no batteries or coil, and is easily started on the magneto without cranking.

CAN YOU AFFORD TO OWN A SPRAY OUTFIT THAT WILL BALK? When you get ready to spray you have no time to tinker with a defective engine, pump, or relief valve, but want an outfit that is capable of a continued high pressure maintenance and one that is thoroughly dependable in every particular.

THE ALPHA AUTOMATIC SPRAY OUTFIT WILL MEET YOUR MOST EXACTING DEMANDS. The entire frame work is made of channel and angle iron, fitted with a wrought steel bed plate on which the engine and pump are mounted, direct connected with machine-cut steel gears.

BUILT IN ALL SIZES from a 2-inch pump and a 100-gallon tank to a 2½ by 3-inch pump and a 200-gallon tank. (Either duplex or triplex.)

IT WILL PAY YOU TO INVESTIGATE thoroughly the merits of the Alpha Automatic Power Sprayer before buying. Send for catalog and prices.

Apricots, Pears and Avocados.

To the Editor: I wish your opinion on the apricot, Bartlett pear and avocado. I have 40 acres in the Perris-Hemet district, all set to apricots coming one year old. It has now cost me about $300 per acre. Do you think it will pay to keep this and depend on the fruit paying a profit when it comes in bearing? Will the apricot business be overdone? For the last few years it has not paid. What do you think for the future of the Bartlett? Will this fruit be grown to an amount which will not pay a profit? I have set fifty avocados. Will it be overdone? Few people so far know anything of this fruit and the market will have to be made, and people will have to learn how to use the pear before we can expect much of a market for it. I am new to California and I would like your personal advice.—P. H., Orange.

[You must not expect us to prophesy in a business matter; you must get all the facts you can and act on your own judgment. However, we feel warranted in saying that we consider the apricot and pear two of our most promising fruits—provided:

First, that you have the apricot in a situation largely free from spring frosts, which have a great chance to make the tree unfruitful because it starts growth so early; also that canneries are developed near to the orchard so that the fruit can be canned cheaply and in the best condition. Otherwise you are compelled to rely upon drying and the profits on dried apricots will depend upon how much of the crop can be otherwise profitably disposed of. The chance then in apricots rests upon three conditions: first, getting the fruit; second, local canning establishments; third, nearness to shipping facilities for the fresh fruit to the east. The last is the least capacious way of disposing of apricots, but it amounts to something. The grower who has these three advantages only has to depend upon drying his crop when otherwise not salable at a fair price. He has, therefore, a better chance than one with whom drying is the main chance. The general good outlook of the apricot depends upon the fact that the area where one will get the fruit is more limited than is the case with any other deciduous fruit, except the almond.

Second, the pear has all the uses cited for the apricot, and with it the shipping of fresh fruit is a much greater opportunity, but getting the fruit depends upon fighting the blight (if it exists in the locality), and this is difficult and expensive and many people will not do it. Therefore the man who gets good pears will get good money, if he is properly connected with canning and shipping, and good pears will be sought for in more remote places than apricots because they carry better and have a longer season. We believe California will never produce too many good Bartletts, for the reasons stated.

Of the avocado we do not care to say as much because it has its whole future to develop. Its success as a large commercial product depends upon two things: first, teaching the masses of the people to like it and producing it cheaply enough to enable them to use it. The claim that both these conditions will be readily reached is not unreasonable, but they are not yet demonstrated. Therefore a large planter of avocados needs not only to be sure of his location, but needs faith and courage and he must work to realize the popular conditions which are needed to make his investment profitable if production becomes large.—Editors.]

CLOTH HOLDS GRAFTING WAX.

[Written for Pacific Rural Press.]

In grafting walnuts, many people put wax on the stub and expect to re-wax when weather has melted or cracked it off. If the re-waxing is delayed until the stub has so dried that the bark loosens from it around the top, the vacancy between the bark and the stub has to be refilled with a new growth or the stub decays. The weather cracks in the stub give entrance to decay fungi that can with only the greatest difficulty be destroyed. They usually weaken or destroy the branch.

H. R. Dakin, who has for years worked on the Hearst ranches in Alameda and Sonoma counties, ties a cloth around the top of the stub so that it projects a half inch; he then fills this half way up with wax, and the cloth is laid down over the end of the stub over and beyond the cut edges of the bark. When hot weather comes and the wax loosens, the cloth holds it in place so that the stub does not dry out, and rewaxing is almost never needed. If grafts start on one side only, he chisels out the dead part of the stub clear down to the living bark and paints to the cut surface, so that it may grow over.

SUDAN GRASS BETTER THAN BEANS FOR ORCHARD RABBITS.

A remedy for orchard rabbits is to fatten them on sudan grass. G. A. Nehrhood of San Luis Obispo county credits the protection of his 300-acre orchard of young almond trees last winter to the acre and a half of sudan grass planted on one side. He would recommend, however, that two or three drills be planted around the orchard. The more the rabbits ate of the sweet tender juicy grass, the more it stooled out. Evidence of the great number of rabbits present was left in the form of "a world of manure." Orchards not far away, of pears, prunes, peaches, apricots, etc., about which blackeye beans had been planted for rabbit bait, suffered the loss of a high percentage of trees, while only three of Mr. Nehrhood's were observed to be damaged. He suggests that there ought to be good shooting among the sudan grass.

PEACHES BETWEEN WALNUTS.

[Written for Pacific Rural Press.]

Peaches half way between walnuts sixty feet apart were planted three years ago for an Alaska man by E. F. Straight of Contra Costa county. As he says, "One can use the land while the walnuts are young, and the peaches, which are thirty feet apart, will not hurt the walnuts for ten years. By that time, the peaches will be on the decline, and it won't hurt the owner very much to take them out."

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QALITY, SERVICE.

We Have a Large Assortment of .

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRIOCTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote you prices.

Experience in Trapping Gophers.

To the Editor: In last week's issue of the Rural Press you give space to a wooden baited gopher trap. This subject is worth all the space you can give it if you give good dope, and I think I can tell you something worth while.

To qualify as a gopher catcher will say that when I was a kid ten years old I cleared a 100-acre orange grove near Pasadena of gophers, catching about ten a day for several months, for which I received five cents per tail, duly amputated and subsequently burned by the owner of the grove, who was Scotch. Since that time, which was many years ago, I have never failed to catch a gopher that I went after. A few years ago I bought an orchard in Santa Clara Valley in which were numerous dead trees (girdled by gophers). I caught 75 gophers the first spring and have kept the place clear ever since, although they keep coming in from adjoining land.

Now the way to get them is very easy when done right. The best gopher trap I have ever seen is called the "Macabee" and is a simple little wire trap painted green, made by a man in Los Gatos, I think, and can be purchased at most any hardware store for 20 cents. I think I have seen it advertised in the Rural Press. This trap will never fail if set right. I used a similar trap when a boy, but this is better, as the trap I had then had a wire bow over the top, while the Macabee sits flat on the ground with nothing standing up except the trigger. There is no need for any other gopher trap to ever be made or purchased, as this one is sure. But it must be set right!

I have seen some people set this trap by bringing the trigger wire out front and over the jaw frame, and the end then set into the hole in the trigger plate. It can be set this way, but it was never intended to be, and when released the trigger wire will knock the gopher right out of the trap before the jaws can close. The trigger wire has a short hook about half inch long at the front end, which is designed to catch over the jaw frame and hold it down. To do this the trigger wire is brought up from underneath the trap and held upright in the center of the trap while the jaws are depressed until the short hook can be caught over them and the trigger set. When properly set the trap will be sprung and the jaws close before the trigger wire has raised more than half an inch from its horizontal position when the trap is set. It will then never interfere with the closing of the jaws.

Prepare your traps by tying a strong cord to the rear end. Have the cord about a yard long and tie the other end to a sharpened stick about 18 inches long and tie a white rag around the top of the stick.

To prepare the hole: Select the freshest mound of dirt or a fresh open hole and cut about a foot back of it with a shovel. If the hole has been plugged, the sharp stick will help you locate it in the shovel cut. Follow back until you get the hole open. If it is a small hole in the dry ground the sharp stick will be handy to widen out the bottom of it a little to make it wide enough to take the trap when set. Most holes are big enough anyway. Set the trap and slip it into the hole, pushing up a little dirt in front of it to hide the trap from the gopher. The farther it goes in the better, but be sure and put it far enough in so that the entire trap is in the hole. Then place over the hole a handful of long grass, a cabbage or kale leaf or any green stuff and then place a large clod of earth against the green stuff and sufficient loose earth to exclude all the light. Look at the trap after three or four hours and if you haven't got him let it stay over night or until he throws up a fresh mound somewhere else. After closing the hole set up the stake as far away from the hole as the string will let you; this keeps the gopher from dragging the trap further down the hole in case he is only caught by one foot or a piece of skin, and the white rag on top of the stake will serve as a flag for locating the trap when you come out to look for it, and will prevent its being forgotten.

I have never failed to catch any gopher I went after with this trap. It is simple, easily manipulated and inexpensive and a half dozen of these traps, well looked after, will clear any place of gophers within a few days. The only better method is where it is possible to drown them out by flooding. The next best thing is a few good cats that don't get anything at the house but a little milk in the morning.

Did you ever read "The Hunter Cats of Connorloa"? Well, those cats helped me clean the gophers off that orange grove at Pasadena when I was a ten-year-old kid.

San Francisco. R. H. Brotherton.

APPLYING FERTILIZER DEEP.

[Written for Pacific Rural Press.]

"I have seen lots of fertilizers applied on orchards without results. I decided it was partly due to the way it was put on," says F. E. Goodrich of Santa Clara county, who thinks that especially where they do not irrigate, it is folly to put commercial fertilizer on top of the ground because it loses plant food value when long exposed to the air. Even when drilled in, Mr. Goodrich feels that it isn't placed where it is needed, so he used a drill simply to spread it on the surface a year ago last spring, and then plowed it under right afterwards. In order to get it all six inches underground, he had a sort of a scraper in front of the plow which scattered it into the bottom of each furrow as it was turned.

"I got 20 tons of apricots last year from that little piece next to the road. Did not expect anything this year, but will get about the same again. Did not apply any fertilizer last spring because I wanted to see what the first application would do. But I will put it on next spring. It costs more that way, but it pays."

J. W. Cassada of San Bernardino county applies nitrate of soda every third year to his orange trees in addition to the regular fertilizer just to help the wood growth and restore sick trees. He puts a box of it on the cultivator with which the irrigation furrows are covered, and shovels it into the furrow ahead of the cultivator according to the needs of each tree, averaging about 2 pounds per orange tree for whole orchard.

Seed Buying

This book is full of information you will want in gardening or farming. Address Dept. H, Germain Seed & Plant Company, Los Angeles, California.

Germain's Catalogue
and
Garden Encyclopedia

is really an interesting and educational work,—a garden encyclopedia, completely indexed, with the minutest details on planting and cultural directions. Order blanks, addressed return envelopes, and a planting chart being included, makes it easy, convenient, and a pleasure to order from Germain's 1916 Catalogue.

Professor E. J. Wickson, of the University of California, Agricultural Department, wrote us —"I could not run my advisory and educational business without your catalog at my elbow." It includes

TREES
Citrus, Deciduous and Ornamental; all kinds of shrubbery, vegetable and flowering plants, berry bushes, etc.

GARDEN TOOLS
for all uses. Lawn mowers, lawn rollers, garden hose, etc.

SPRAY MATERIAL
and Spray Pumps. Special Deming pump catalogue sent on request.

SEEDS
Flower, Vegetable and Field.

POULTRY SUPPLIES
Our 1916 Catalogue of Poultry Supplies and everything for household pets is now ready. Special pamphlets on many subjects. Tell us your troubles.

California County Free Library Service.

[Written for Pacific Rural Press by J. L. Gillis, State Librarian.]

In a little more than seven years, county free library service in California has grown from nothing to immensity. Its development has caused the most imaginative student of social and economic problems to rub his eyes in wonder. Its completeness of conception has filled with delight the librarian desiring to make the word service really mean what it says. And its service has made even the most astute business man realize that a library can be a real asset, can bear a big interest on the investment, instead of being a sentimental dependent.

Before the establishment of the county free library in California, the people had—if they could get it—public library service from three different sources,—the municipal library, the traveling library, and the special loans from the State Library.

Such service was extravagant because it duplicated in some places, and left bare patches in so many other places that the citizen had to build up a private collection, costing out of all proportion to the temporary use he gave any one book.

Such service was also unequal, for while the citizen was helping either directly or indirectly, to support municipal state libraries, he usually lived where he could make no use of either.

Such service was also incomplete, for it did not reach even a small percentage of the people, and never could, even developed to its highest degree.

California's solution of these problems has been the county free library system. Thirty-three counties have already adopted the plan, and each month sees new ones added to the list. It is a library for the whole county (not including towns with libraries unless they choose). The supervisors of any county have power by law to establish the library, which has business headquarters at the county seat in charge of a trained and experienced librarian, certificated by the State Board of Library Examiners. Branches are established wherever needed in all parts of the county—in a town with no library service at all; in a town wishing to have its supply supplemented; in a country community; in a school district, in an isolated home. Wherever there are people to read, there are books and magazines to be read. The number and kind of books depend upon the needs and wishes of the people. Books are moved from the branch as soon as their usefulness ceases, and fresh ones take their place.

The county builds up and owns for iself a working library of books that will be so continually in use in the branches that they wear out before they rust out. If a book is wanted that is not in the branch, it is sent free from the county free library headquarters. Failing to be there, the request is forwarded to the State library, which undertakes to supplement, entirely free, the county free libraries, even paying transportation both ways. Thus a library becomes a live, business institution, supplying its wares to the physician, the lawyer, the student, the teacher, the merchant, the minister, the farmer.

One magazine writer has called the California county free library system "the most socialized thing in the State." And a supervisor said of it, "The most pouplar thing we've done since I was on the board. Why? Because it reaches every home and everybody."

COMMERCIAL FERTILIZERS SCARCE.

Commenting on the seriousness of the commercial fertilizer situation due to the European war, the Secretary of the U. S. Department of Agriculture says: "In the unusual conditions existing in the fertilizer trade, it is important that all fertilizing materals on the farm, especially those containing potash, should be conserved. The fertilizer ingredients already existing in the soil should be utilized and developed to the fullest extent. A great deal can be accomplished in this direction by deep plowing, constant cultivation, and thorough tillage. There should be a proper system of rotation. Especially where one crop has been grown for several years a different one should be planted this year. Green manures and cover crops should be used as much as possible in their proper rotation.

"Of the organic substances, manure, both solid and liquid, is the most important and should be utilized wherever possible. All material of an organic nature, such as leaves and bedding of various sorts, should be composted and the compost applied to the soil. Special attention should be given also to the conservation of wood-ashes. Depending on the character of the wood, they contain potash in quantities varying ordinarily from three to ten per cent. All tree trimmings, brush cuttings, etc., should be burned and the ashes derived therefrom utilized.

"The application of lime to many soils is of undoubted benefit. Though the availability of the fertilizing elements in the soil may not be greatly increased by its use, the resulting improvement in physical and bacterial conditions may increase considerably the productiveness of the soil."

One hundred and twenty-five tons of dried apples were put out the past season by the larger of the two driers at Aptos, Santa Cruz county, according to J. J. Verhoff who has 10 acres of apples there, but is planting only pears for the future.

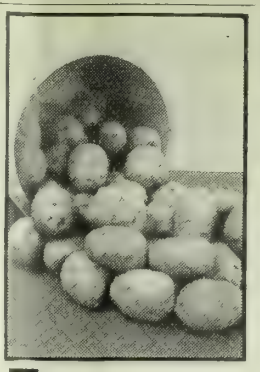
DEMISE OF DR. E. W. HILGARD.

(Continued from page 57.)

was a labor that he performed faithfully for almost three decades and that resulted in making the California college of agriculture one of the most efficient in the world. He began research work immediately upon his arrival in California and published his first results in 1877—thus constituting the experiment station which he established the oldest in the United States. He remained head of the College of Agriculture and Director of the University experiment stations until his retirement in 1903.

Outside of his university duties, Professor Hilgard found time for a tremendous activity. His work in the direct investigation of soils in connection with their native vegetation, of the influence of climate on the formation of soils and especially of the nature of "alkali soils," a problem hitherto little probed in this country, achieved for him a reputation as wide as the world of science. It brought him recognition on numerous occasions. Mississippi, Columbia and Michigan universities, as well as the University of California, have bestowed the Doctor of Laws degree upon him. The Academy of Sciences of Munich presented him with the Leibig medal for distinguished achievements in the agricultural sciences and the international exposition at Paris, in 1900, gave him a gold medal as a collaborator in the same research.



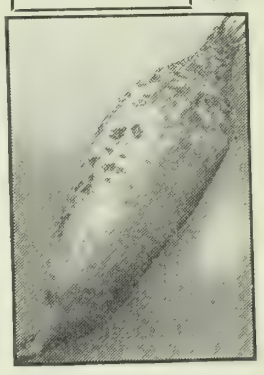
From 1879 to 1883 Professor Hilgard was an agent of the United States census, and his investigation of the cotton crops of the country formed an important portion of the census report. In the latter part of this period he was employed also in charge of the agricultural division of the northern transcontinental survey.

During all of his period of academic activity, Professor Hilgard was almost constantly engaged in the task of authorship. He wrote an extensive report on the geology and agricultural features of the Pacific Slope, a memoir on the rock-salt deposits in Louisiana, a large number of reports of the California Agriculture Experiment Station, and two later books since his retirement from the faculty, "Soils of the Arid and Humid Regions" and "Agriculture for Schools of the Pacific Slope," the latter in collaboration with Professor Osterhout, formerly of the University. To many American and foreign publications and governmental reports he contributed from 1854 to a few years ago.

Since 1910 Professor Hilgard's advanced age has rendered him unequal to the pursuit of extensive tasks. He maintained, however, his membership in several scientific societies and was vitally interested to the last in investigations connected with his science.

Professor Hilgard met with two great bereavements during the active period of his life—the loss of an only son, about twenty-five years ago, and, subsequently, the loss of his wife. He is survived by two daughters, Marie Louise and Alice Hilgard, who have given him great joy and delightful companionship during his declining years—caring for him as perhaps a good father always deserves but does not always receive. Professor Hilgard's home and social life were exceptionally pleasant and inspiring and personally he endeared himself to the whole community, which gave him true love and abundant honor.

Eight cars of lemons and 34 cars of oranges left Riverside last week, the heaviest shipments since the season commenced. This makes a total of 163 cars from that section to date. If weather permits more fruit will be shipped from now on.



1916 Seed Catalog Now Ready

It is **FREE**—mailed on request. It tells how and when to plant—garden, flower and field seed.

Seed Potatoes We now have a fine, true-to-name, healthy stock of American Wonder, Early Rose and Garnet Chili Potatoes. These are all good, early, standard varieties, suitable to California conditions.

Uses of Sunflower Seed.

To the Editor: In trying to find out what is done on a large scale with sunflower seeds I was informed by one party that they were used for seed, chicken feed, for oil, but on inquiry at the Pacific Oil and Lead Works, I was told: "We know of no mills in the United States that would be interested in the purchase of sunflower seed." I am still in doubt what the crop is grown for.—R. L., Modesto.

[Our observation is that the crop is usually devoted to home uses and sold for seed to grow more plants to serve more home uses. We doubt if it largely enters into any commercial or manufacturing uses in this country.

Dr. Cardiff, Director of the Experiment Station at Pullman, Wash., gives the following information:

"The sunflower makes excellent silage, especially when mixed with corn and some legume in about equal parts of each. The seed has an unusually high oil and protein content. On account of the latter its growth rapidly exhausts the nitrogen from the soil and, therefore, if grown successively on land, the soil will require considerable fertilizer. The oil portion does not exhaust the soil since the elements from which oil is made come from the air and water.

"The seed is used in the production of oil, which is extracted by compression, and is of value for table use, cooking purposes, and in general the same use as is made of olive oil.

"In Russia the seeds of the larger seeded varieties are sold as peanuts are in this country, and eaten raw. The plant has also been used quite extensively in paper manufacture in some of the European countries.

"The sunflower should be grown upon soil which is suitable for corn and planted and cultivated about the same as corn, though it will stand a little earlier planting than the latter on account of its greater resistance to frost."]

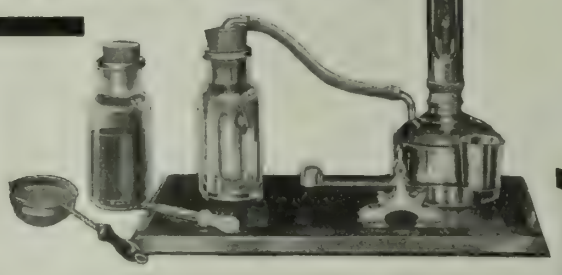
CALIFORNIA LEADS BEET-SEED ENTERPRISE.

Californians who know W. K. Winterhalter as a qualified agricultural expert, especially strong in the science and practice of sugar beet culture, will be interested in the announcement that he is now leading an enterprise which aims to free the United States from dependence upon European sources of sugar beet seed. He has for the last two years been directing experimental cultures in Idaho, which yielded most encouraging results, and now there has been effected a large enterprise called the U. S. Beet Seed Co. operating from Salt Lake City as a business center. The organization of the company is one of the results of a convention of beet sugar manufacturers held last fall in Salt Lake. On account of the European war more or less difficulty has been experienced during the past year in obtaining seed for the sugar beet crop in America. Some American companies have been experimenting in beet seed culture for upward of twenty years, but most with indifferent success. The companies in Utah and Idaho have obtained better results than those of other sections, and during 1915 raised ample seed for the 1916 crop. The experiments have proved that Utah and Idaho are better adapted to beet seed raising than any sections yet tried in America.

If normal conditions obtain at the close of the European conflict, some doubt has been expressed as to whether America can compete with the Germans and Russians in beet seed culture, on account of the low wages paid in foreign countries. But the manufacturers decided that it would be unwise to take chances on an early end to the war, besides they figured that by growing seed in the United States, even at a higher cost, a supply of fresh seed would always be available.

Mr. Winterhalter has put away enough mother beets and stecklinge to produce from 16,000 to 20,000 bags of beet seed in 1916, depending on weather conditions. He expects to leave for Utah and Idaho the middle of February and will spend all summer and fall in Utah and Idaho, devoting his entire time to the development of this new industry.

CURING PEACH LITTLE LEAF



To the Editor: Several of the peach trees in my Muir orchard seem to be dying. The leaves turn a yellow shade, generally on one side of the tree first, and next year make very little growth. The leaves come out in thick clusters and the fruit sets very heavy, but the wood dies back and the disease spreads to other trees. Is it little leaf?—G. A. B., Mountain View.

[Yes, the new growth is practically bare of leaves except clusters near the tips and low down near the junction with the next branch. The leaves that are left are yellowed; sometimes motiled; considerably smaller than natural and somewhat wrinkled. Red spider has nearly the same effect in several cases except that no leaves cling in clusters at the tips.

No cause or treatment is known, though it is suspected to be a matter of malnutrition because it comes mostly on sandy soils poorly supplied with moisture. It is related to orange mottle leaf. F. A. Hogan, Sup't of the Visalia Fruit and Land Company's orchards, found two or three small blocks of peaches aggregating about 5 acres, affected with little leaf so badly five years ago when he took charge, that the company advised him to pull out the trees. In two years they were looking as healthy as any, and there is no trace of little leaf in the orchards now. Though he is said to have a concoction which he applies to the trees, it is the opinion of competent authorities that their recovery was due to drastic root pruning and consequent renewal of the root system, in connection with good cultural methods. He plowed and chopped and subsoiled the old orchards about two feet deep within four feet of the trees on both sides of each row. He hauled out two or three hay-rack loads of roots, many as big as a man's wrist. Rootlets started from the cuts and the trees were rejuvenated.—Editors.]

It is expected that about three or four hundred acres will be planted to almonds in the Oakdale section this year.

The Standard Soil Tester At Your Service

It Will Show You Accurately:

1. Whether a soil is in the right chemical and physical condition.
2. Whether a soil is **slightly, moderately** or **extremely acid.**
3. How much Lime is needed per acre to counteract the acidity
4. What quantity of Carbonates (Lime and Magnesia) a soil contains. It will indicate quantities, both in "percentage" and "in tons per plowed acre." From this you will see whether a soil is lacking in them or has plenty of them.
5. Whether disclosure of Carbonates is Alkali or Lime.
6. Whether a soil is lacking in Humus. It will show you whether a soil contains 1 per cent or more, ½ per cent, or none.
7. Whether a soil is in need of a green manure crop.
8. It will demonstrate the probability as to whether a soil will respond to applications of chemical fertilizers or not.

IDEAL TRACTOR

Does everything horses do and Considerably more

This product of the Union Tool Company has been demonstrating in actual tests during the past few weeks its great superiority over horses and other tractors.

The Ideal has been built especially for Western farms and orchards and we are ready to demonstrate its merits at any time.

The weight is so distributed in the Ideal the pressure is only seven pounds to the square inch on the track and as a result there is no packing.

In ordinary use it will not use more than a gallon and three-quarters of distillate an hour. It is simple in operation and sturdy in construction.

Not only is the Ideal tractor an indispensable labor-saving machine for any ranch, but it will save its cost in less than a year's time.

Made and sold under an absolute guarantee that is backed by the largest manufacturing company on the Pacific Coast.

47 inches high—11½ feet long—1200 lbs., or 10 horsepower on draw-bar.
Lays its own track—works any place.
Immediate deliveries. Terms.
Tractor now on Display in our Salesrooms.
MAIL THIS COUPON TODAY.

PACIFIC METAL PRODUCTS CO.,
1228 So. Flower Street,
Los Angeles, Calif.

Rice Growing Notes.

[Written for Pacific Rural Press by M. D. Woodruff, Biggs.]

Additional to the article about my field in a recent issue, I would make a few more suggestions about rice, and about the field I grew here last year. It would seem my field was a long time growing and not much ahead of some other fields in earliness of harvesting. On strong sediment land or any land that is too rich, the rice will be later in maturing. Also rice that is thickly sown will be later in maturing. I had a thick stand. Rice on land not previously planted to this crop stools out more than on second or third year land; and will be 10 days later in maturing. Mine was new land.

Now as to the 10 acres sowed March 21, and the 10 acres sowed March 28. This was really the best rice and slightly ahead of the 15 acres sowed Apr. 7, yet the difference was only scarcely noticeable. The weather was cool enough (and most always is at that time of the season) that the first seeding grew but little before the other started to grow nicely, and it was all together, practically, in starting its real growth. There is little advantage to be gained in planting before Apr. 5, but every day counts after that, for Wateribune rice, if the weather is at all favorable for growing.

Growth before Irrigating. — Rice will be much better and make stronger plants all the way through if it is possible to start it and get some growth before irrigating, and the roots will take a hold and make better formation. Owing to the nature of soils, however, there is only a small percentage of the rice land that works easy enough to make a seed bed fit to bring up a perfect stand and hold the moisture very long.

With many, the danger of early planting is this: Rice is a hardy plant, but the seed is easily rotted or destroyed by flooding with cold water and keeping cold and wet too long at germinating time. Also by keeping the plant entirely inundated while it is too small. Rice will stand lots of cool weather without being destroyed after it is, say, two or three inches high, and if it is not inundated.

Frost.—As to frost, I would have little fear. Three years ago I saw a small field bit with frost when the plants were two inches high and it was injured not the least. Two years ago the middle of Nov. I took young tender volunteer plants which were about two inches high and planted them in a box. I kept the box containing these plants well exposed to the frost and the elements. They survived it all and started growing nicely in the spring although we had a number of frosts and several times the ground was crusted with frost in the box. The plants did not grow any during the winter. I would not advise fall planting in the field, however, because other grasses, etc., start their growth so much earlier, that the rice plants would almost be choked out.

REGULATING USE OF WATER.

[Written for Pacific Rural Press.]

"All water passing through power plants should be required to be turned loose at a level determined to be high enough to permit irrigation of land naturally tributary to such water supply," says Engineer A. Griffin of the South San Joaquin and Oakdale Irrigation projects. He holds that power development should be considered secondary to irrigation, though "it is very desirable to make the fullest use of all water possible both for power and irrigation. In many places where water could be used for irrigation in years to come, power interests get control and prevent the irrigation development. There should be a legal way to preserve such water for irrigation, as well as to obtain economic adjustment where power and irrigation interests already conflict.

Legal Duty of Water. — More efficient use of water often means use of more water; in many cases it means the use of less. The most efficient use of water depends on many variable factors such as supply, distance to irrigable land, kinds of crops, crop yields and prices, rainfall, etc., so that "any legislation defining or governing the duty or use of water at this time, if desirable at all, would have to be very broad, merely fixing outside limits" and providing for broad-minded administrators of the law.

SAVES RIVER BANK.

[Written for Pacific Rural Press.]

When the creek or river currrent is eating away your fine alluvial farm land, you want to fight it. Judge R. B. Canfield of Santa Barbara county has a ranch on the Santa Ynez river from which the current washed several acres last winter. The general channel is perhaps half a mile wide, through the sands and silt of which the summer flow has a more or less new channel every year.

Last summer, after the principal current had taken a bite from Mr. Canfield's land, he put in a patent V-shaped "current deflector" which sticks its nose into the river just where high water would hit the bank with considerable force. Though there have at this writing (Jan. 7) been no heavy floods to test the deflector severely, what current there has been was deflected so that it hit the bank farther down stream on the big curve, where another deflector is needed.

Upstream from the deflector, a wide gravel bar has already formed, though the Judge has not noticed what has been built in below. Though Mr. Canfield thinks the price of the deflector rather high, he says its cost is far below its value in saving the good farm land, so far as his experience shows.

At the recent meeting of the California Hop Growers' Association held in San Francisco, it was decided to take up with the brewers the matter of purchasing hops direct from the association instead of through brokers. As a further result of the meeting, an office will be opened in San Francisco in the near future.

"—that's service"

Ask any owner who attended our 1915 Caterpillar School. He'll tell you how the school increased his profits, taught him to get maximum results from his tractor. And our annual Caterpillar School in Stockton, Calif., and Spokane, Wash.—free to owners—is just one branch of our complete service.

CATERPILLAR

Reg. U.S. Pat. Off.

Don't Say Caterpillar Unless You Mean Holt!

The *best* service we give is the service we build into the Caterpillar *itself*—the kind of service of which owners write:
"Have used my Caterpillar five years. The original track chains are still in use."
"Repair bill for season less than $10.00."
"$10,000 worth of work this year—repair bill $1.65."
A postal will bring you Bulletin C 331 which describes the Caterpillar fully. Or if you're interested in the Caterpillar School, opening January 31st, write for particulars—a low tuition fee admits you if you're not a Caterpillar owner.

San Francisco & San Diego Expositions

THE HOLT MFG. CO., INC.
STOCKTON, SAN FRANCISCO, LOS ANGELES.

General Agricultural Review.

DECIDUOUS.

Santa Barbara county imported over two carloads of peaches last season.

Prunes come second to almonds in the nursery buying for orchards to be planted about Paso Robles.

A public meeting is to be held at Beaumont, Riverside county, January 15, to discuss apple culture and marketing.

Horticulture commissioners of Washington are reported to be starting a war on vendors of apples which are badly damaged by the San Jose scale.

A meeting of farmers and business men was held at Bangor, Butte county, January 8, for the purpose of discussing the planting and shipping of deciduous fruits.

J. E. Hassler, County Horticultural Commissioner of El Dorado county estimates that there were $62,361.36 worth of pears shipped from that county last year.

New Zealand fruit growers marketed about 150,000 boxes of apples in South America last year. It is estimated that there is a market there for 200,000 boxes a year.

The annual meeting of the stockholders of the Sebastopol Apple Growers' Union will be held at Sebastopol on Feb. 7, at which officers will be elected for the ensuing year.

The Santa Maria Valley district produced last season 42 tons dried apricots, 75 tons prunes, peaches, etc., and 490 bags walnuts, according to Horticultural Inspector R. C. Wylie.

Pear planting will be extensive in Nevada county this year. County Horticultural Commissioner D. F. Norton has already inspected 17,500 trees, of which the major portion were pears.

The Atascadero colony cleared and planted 3500 acres last winter to peaches, pears, apricots, prunes, and apples. They expect to plant about 3,000 acres this spring, according to B. D. Conrad.

Trees from Kansas and other eastern states which have been arriving in various parts of the State are undergoing a close inspection for peach borers, by the horticultural commissioners of the State.

A new course on deciduous fruit insects is announced by the College of Agriculture of the University of California. E. O. Essig, instructor in entomology, will be in charge of the new course which will give special attention to the control of insect pests.

A joint potato and apple conference is to be held at Sebastopol, January 29. W. V. Shear of the U. S. Agricultural Department will be present at the meeting and President Jerome of the Watsonville Apple Distributors' association will speak on the standard apple pack.

F. B. McKevitt has been elected president of the Producers' Fruit company. It is intimated that this company will practically confine its operations to handling fruit on a commission basis in the future. This is also the plan of several other large fruit distributors.

An attempt is being made by Harry Adams, traffic manager of the California Fruit Distributors, to have the freight rate on fruit to southeastern territories reduced to the blanket rate of $1.15 per 100 pounds, which is the prevailing rate to other sections of the country.

Over $300,000 has been subscribed to the California Peach association up to the first of this week and it was thought that the total would reach $350,000 before the meeting at Fresno, on Wednesday of this week. This includes large subscriptions from the banks and business houses in Fresno which have been very generous supporters of the idea. A total of 23 nominees for trustee had been named out of the 25 at the time of this writing, and every effort is being made to select men of ability. From these trustees will be selected the directors of the new organization.

CITRUS FRUITS.

Growers who participated in the Christmas pool of the Colton Orange Growers' association received a little better than two cents a pound for their fruit.

Nearly 2,000 information seekers visited the citrus experimental station at Riverside last year and about 100 lectures were given with large attendances.

The recent wind storms did considerable damage to the unharvested orange crops at Fair Oaks, Sacramento county, knocking large quantities of fruit from the trees to the ground.

The plant of the Levitt Orange Juice company at Riverside which has laid idle since last July will be re-opened and an active campaign started in the manufacture of orange juice products.

J. R. Frisbee of Berkeley purchased a nine-year-old Washington navel orchard at Lindsay from A. R. Wifley last week. The purchase price was $26,000. This is the first purchase of orange property in that vicinity since the beginning of the financial depression.

According to the California Fruit Exchange, oranges sold for the week ending December 25 averaged $.91 a box more than for the corresponding week in 1914. Figures from the same source show that the association received considerable more per box than did their competitors during both years.

OLIVES AND NUTS.

In spite of blight, Santa Barbara county walnuts brought growers $300,000 cash, according to C. W. Beers.

Carpinteria walnuts were unusually free from blight this year, while the most severe damage ever done is reported from Goleta.

The past season, codling moth has injured no walnuts in Santa Barbara county, because the shells had hardened early before the larvae got to them. In 1914 a great many nuts were destroyed.

A representative of the Van Camps Product company has been visiting Sacramento valley olive districts gathering data on olives. Growers in the valley are of the opinion that this concern may be contemplating entering the olive packing field.

A consular report from Seville, Spain, says that as a result of lack of rains last fall, the olives of that section are exceptionally small. Exporters who are also growers converted their own crops into oil and purchased from their neighbors for pressing.

Superior Northern Grown
TREES
Oregon grown trees have earned an enviable reputation in California. Many Inspectors have pronounced them the finest trees that come into their district. We have a limited surplus of the following:
PRUNES—
French on Myrobolan.
French on almond.
Imperial on almond.
Imperial on Myro.
Sugar on peach.
Sugar on almond.
APRICOTS—
Royal on Myro.
PEARS—
Bartlett. Anjou.
Clairgeau and other leading varieties.
These are all our No. 1 grade—strong, thrifty trees, good roots, clean and smooth. No cull trees that we are stuffing off at "bargain prices." Let us know your wants, now. Prompt shipment assured.
OREGON NURSERY COMPANY
ORENCO, OREGON.

Why Not Cut Off the Two Cars of Filler?
It takes 400,000 cars to carry Fertilizers to our farmers every season. Forty per cent. —2 cars out of 5—is Filler. Order higher grades and Nitrate of Soda for your activ Nitrogen and save freight.
The greater producing capacity of high-grade fertilizers without much filler means bigger out-bound tonnage for railroads and bigger purchases by farmers.
Send for "Cost of Available Nitrogen."

Monadnock Bldg., San Francisco

Paso Robles people are proud of their almond possibilities. Dr. V. Ward of the Chamber of Commerce has recently compiled figures on acreages of fruits in that section, showing over 2000 acres already planted and over 1000 acres definitely to be planted next spring.

Evaporated olives are the latest thing in the way of eatables to make their appearance in Oroville, and reports from there state that the fruit is of exceptionally fine flavor. It is thought that the new process will take care of the small olive problem, allowing for their disposal in small convenient packages.

The Ehmann Olive company have petitioned the California Ripe Olive association to take steps to prevent the sale of green olives, artificially colored, as California ripe olives. It is claimed that the present lack of market for ripe olives is due entirely to the woody taste which occurs in artificially coloring the fruit.

GRAIN AND FIELD CROPS.

Final steps are about to be taken in Ventura county for the State organization of lima bean growers.

But very slight injury is reported to have been done to the celery crop around Antioch by the recent freeze.

Last year there were approximately 800,000 pounds of green peas shipped from Brawley.

It is estimated that there will be 23,000 cars of celery shipped from the River district this winter.

Over 400 acres of sudan grass are to be planted in the vicinity of Paso Robles this spring.

The Los Angeles Honey Co. of Wheatland recently shipped a carload of honey to the Chicago markets.

According to reliable reports, the past year's bean crop in the Pajaro Valley was five times as large as that of 1914.

The Santa Maria district of Santa Barbara county produced last season 5000 bags onions, 16,000 bags potatoes, 20,000 bags oats, 21,000 bags barley, and 320,000 bags beans.

The grain harvest in the lake bottom lands in Kings county amounted to $9,000,000 the past season; and it is expected that it will reach the $10,000,000 mark this coming year.

E. H. Grubb, a well known potato grower of Colorado, has recently purchased a ranch near Princeton where he will engage in experimenting in improving the seed standard of potatoes.

About 25,000 acres sowed to wheat and barley in District No. 108, Colusa county, is said to be entirely under water as a result of the recent storms. The loss is estimated at $100,000.

The Lompoc district produced last season 2000 bags barley, 5000 bags potatoes, 7000 bags mustard, 20,000 bags oats, 30,000 bags onions, and 250,000 bags beans, according to R. C. Wylie.

The Sperry Flour Company of Stockton has purchased the wheat on exhibition in the Australian Building at the Panama-Pacific Exposition with the intention of experimenting with it on San Joaquin county land.

GRAPES AND SMALL FRUITS.

The Langford ranch northwest of Lodi shipped 40 carloads of table grapes East last season which netted them 59 cents a box f. o. b. cars.

Reports from various sections of San Joaquin county indicate considerable damage caused to the young grape vines by jack rabbits.

J. A. Chapdelain of Lodi netted $30,000 from 80 acres of Tokays this season. The perfect fall weather made it possible to pack almost every bunch.

The Woodbridge Fruit Company of San Joaquin county shipped 300 crates of Mission grapes to Austin, Texas, last season, which netted them $1.00 a crate. Mr. Mills states that he couldn't do that well every season, the prices being unusual on account of the scarcity of black grapes this year.

MISCELLANEOUS.

Directors of the South San Joaquin Irrigation District have sold $50,000 worth of irrigation bonds to the State at 83½c on the dollar.

Co-operation in Marketing will be the subject of a new course in the University of California to be given by Elwood Mead, professor of rural institutions.

The farm bureau of Ventura county is undertaking solution of storm water troubles in the steep-sided valleys, by organizing storm drainage districts.

At a recent meeting of the Farmington center of the San Joaquin County Farm Bureau, the plan of holding a Community Fair at that place was discussed.

The famous "Big Five" ranch of Lovelock Valley, Nev., consisting of thousands of acres of the richest and most productive land in Nevada, is being subdivided and sold at an average price of $100 an acre.

The work of compiling a classification of the soils of the San Joaquin Valley from a point north of Tracy has been stopped for the winter months; and the National and State experts in charge of the work have gone to Los Angeles county to do work of the same character

The Law says KILL 'EM

Did you know there's a California law compelling all persons to rid their land of ground squirrels? But law or no law, you're alive to the damage these pests do to crops and trees and land. You want a cheap, easy way to fight them.

KILMOL
SQUIRLGOPHENE
Will Kill 'Em All

It is simple, sure, quick and practical. Saturate a waste ball in Kilmol, place it in burrow and after 3 or 4 minutes ignite. The deadly fumes remain in the burrow for hours—the rodent can't escape. 100 per cent efficient. Results guaranteed or money refunded. Used by Government, State and County officials. **Get Kilmol from your dealer.** Also waste balls—better and cheaper than home-made. Also ask him about new U. S. Government formula of poisoned barley. Write for interesting information about squirrel and gopher eradication.

KILMOL SQUIRLGOPHENE
Kilmol in the United States Destructor Gives 100% Efficiency. Invented by U. S. officials.

Planters ARE SAFE WHEN PURCHASING ROEDING TRUE TREES FRESNO, CAL.

Thousands of satisfied customers will tell you that it p ays to plant the best—Roeding's true trees.

SEND TODAY for a copy of our 1916 illustrated price catalogue, which lists and prices over 2000 varieties of citrus and deciduous fruit and ornamental trees, vines, plants, shrubs, as well as evergreens, palms, roses, etc. It is the most complete price catalogue that we have ever issued, and should be in the hands of every planter. It will be sent free to any address on request. When writing send us a list of what you propose to plant this season—or ask us for suggestions.

WALNUTS, OLIVES, GRAPES, CITRUS TREES, ORNAMENTALS

We can supply almost any quantity of these in all the best varieties as well as nearly every other sort of fruit or ornamental trees or plants that you may wish to set out. We are recognized headquarters for Walnuts, Olives, and Citrus stock. Do not fail to get our quotations before placing your order.

FANCHER CREEK NURSERIES, Inc., - - BOX 18, FRESNO, CALIF.

If you live in Southern California, our representatives, Roeding & Wood Nursery Company, 1617 E. Washington St., Los Angeles, will take care of your orders promptly and in good order.

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

TRACTOR TERMS.

With the coming of tractors and other kinds of gas-propelled vehicles has come a new set of technical names which users are often at a loss to clearly understand. The following are just a few of them explained in a simple manner: The amount of power delivered to the belt pulley of the tractor which can be used for stationary work is sometimes called "belt power."

Draw-bar Horsepower D. B. H. P.)—The horsepower exerted by the tractor at the draw-bar. With good traction conditions, this is usually rated at about one-half of the B. H. P., though many tractors will seldom develop this much.

Horse-equivalent Horsepower (H. E. H. P.)—The number of good, average farm horses that the tractor will replace for hauling of any sort. Theoretically this should be the same as the D. B. H. P., but actual experience has shown that the technical figuring which gives the draw-bar rating often exceeds what the tractor will actually do in comparison with farm horses.

You will have noticed that the customary method of describing the rating of a tractor is, for example, "8-16"—8 D. B. H. P. and 16 B. H. P.

Internal Combustion Engines.—As the name indicates, the fuel in the form of a vapor or gas burns and expands (or explodes) within the cylinder and there forms a high pressure and rotates the crank. The combustion of this vapor is usually accomplished by means of an electric spark.

Internal combustion engines can be divided into three classes—gas, gasoline (distillate, kerosene and naphtha) and oil.

Motor—The mechanism that generates power — cylinders, pistons crank, etc. This does not include the transmission gears, frame, etc.

Tractor — A substantial, slow-speed, motor-driven machine built exclusively for hauling heavy loads in the fields or on the roads. Tractors do two general classes of work: 1—operate belt-driven machinery; 2—draw field implements and haul.

Horsepower—The power required to lift 33,000 pounds one foot in one minute. There are four kinds of horsepower ratings:

1—Indicated Horsepower (I. H. P.) — The absolute horsepower developed in the cylinder and registered on the indicator instrument before friction of the bearings, etc., has used up any part of it.

AMERICAN WATER POWER.

The national forests contain approximately half of the water power of the West. The department for nearly a decade has been issuing permits for its development. Unfortunately, the present law does not authorize the granting of permits for fixed periods. It should be amended, and recommendations to this end have been made repeatedly by the department.

While authority to grant term permits undoubtedly would aid water-power utilization, the fact remains that development, practically to the extent of the market, actually is now taking place on the forests.

In the Western States power development has advanced proportionately very much more rapidly than in the East, where land is privately owned. The amount of water power used in the generation of electricity by public utilities corporations, street railway companies, and municipalities has in the last decade increased 440 per cent in he West, or more than twice as fast as in the remainder of the country. There, in proportion to population, four and one-half times as much water power is used as in the remainder of the United States, and nearly three times as much as in the Eastern States.

Of the existing 1,800,000 water horsepower in the Western States, 50 per cent is in plants constructed in whole or in part on the forests and operated under permit from the department. Plants under construction will develop about 200,000 additional horsepower, while over 1,000,000 more is under permit for future construction. The chief obstacle to further immediate water-power expansion is the lack of market, for plants in operation in the West now have a surplus of power of which they can not dispose.—From annual report of U. S. Secretary of Agriculture.

LUBRICANT FOR WORN GAS ENGINES.

[Written for Pacific Rural Press by Chas. Barnum.]

A very good and most reliable lubricant for old and worn gasoline engines can generally be found on the average farm. This is Castor machine oil, usually termed "yard oil" because it strings out in an oozy fashion.

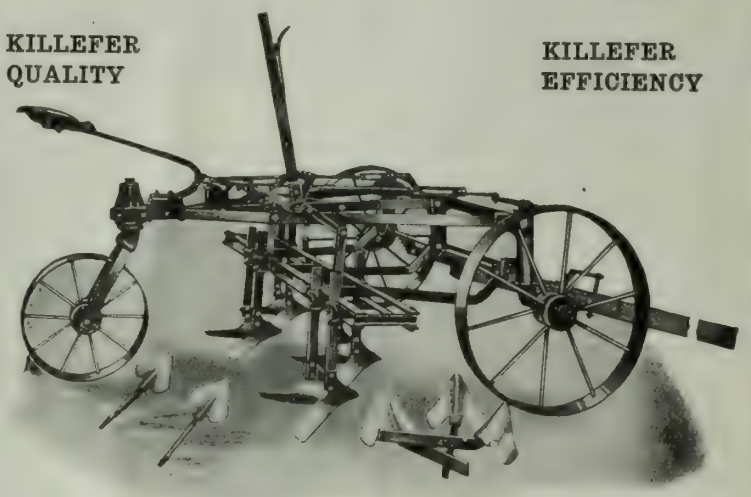
This oil costs 40 to 50 cents per gallon, and a quart of it will generally last as long as 3 of the ordinary brands of gas engine oil.

It can be used straight or mixed with various proportions of other oil, according to the thickness required. This oil is especially good for old engines whose pistons and rings are so badly worn as to cause great loss of compression. It puts in a snappy clear bark and adds about 25 per cent more to the horsepower on worn machines. It does not foul the plugs and if bearings are washed out occasionally to rid the gum, no bad effects are encountered.

The writer made this little discovery this summer while crossing hot deserts with an air-cooled engine. He never had an over-heated engine.

SPRAYS TREES BEFORE PLANTING.

Nursery trees awaiting planting should be set in trenches and the roots covered tightly with moist dirt. So situated, they are handy to spray for whatever insects, fungi, or scales may have escaped inspection. Lime-sulphur will be better than any other one spray.



If the trees are not handled for a day or two after spraying, whatever is rubbed off in planting will not materially affect results, which it is claimed are obtained within 24 hours of spraying.

On the Cory ranch in San Joaquin county two men sprayed 6,000 trees in 15 minutes with 20 gallons of mixture, using a Bean Power sprayer and a Jumbo nozzle.

Beet Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turnbuckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheels that holds it rigidly in line except on the turns. This is the strongest and best made Beet Cultivator for sale on the Pacific Coast.

MAGNETO.

If your motor is not working right don't jump at conclusions—don't take the magneto apart. Disconnect high tension wires from spark plugs and hold the terminal not more than one-fourth of an inch from the plug. Turn the engine over and watch to see if there is a spark. If there is a spark, it is evident the cause of the trouble is in the spark plug. (See article under Spark Plugs.)

If there is no spark, it is necessary to inspect the wiring very carefully. Start at the batteries and look for loose connections, and short circuits. Inspect the insulation closely, as sometimes the insulation gets worn off from friction, so that the bare wire is touching the motor or frame, causing short circuit. Ninety-nine per cent of the ignition troubles with the magneto will be caused by defective wires, poor connections, or defective spark plugs, for these magnetos are built very strong and durable and should outwear your motor. If you have any ignition trouble that you cannot correct yourself, take the matter up direct with the magneto manufacturer.

Caution.—When testing for spark with high tension wire removed from plug, do not hold it more than one-fourth of an inch from the plug. Under no circumstances should the wire be three or four inches from the plug when the circuit is on, and the motor turning over. This practice is hard on the coil.

SPARK PLUGS.

It is very important that the spark gap between the points at the inner end of the plug is the right distance. (Where Kingston magneto is used the opening should be sufficient to permit a ten-cent piece to just slide in.) (Where Sevison magneto is used the opening should be such that a ten-cent piece cannot enter without forcing points apart). If the porcelain in the plug becomes coated with carbon, which is a conductor of electricity, the electric current will follow the carbon and not jump the gap between the points. Defective porcelains are deceiving to the eye; plug placed on top of the cylinder and connected up electrically may spark alright to the gap, but when screwed in the cylinder and under compression the current will leak through the defective porcelain and not jump the gap. The reason for this is that air is an insulator and when a cylinder has 60 pounds cold air compression there is five atmospheres squeezed in one and would be five times as hard for the electric current to jump the gap as it would in open air. Electricity always follows the line of least resistance, so if the porcelain of the spark plug is coated with carbon or is defective, the electric current will not jump the gap and produce a spark.

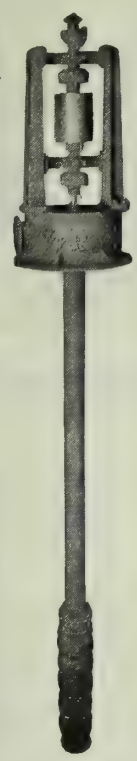
ENGINE WITHOUT BATTERIES.

A subscriber at Gilroy writes us about batteryless engines as follows:

"T. P. I. of Sebastopol does not state what size engine he wants in last issue. I have been using a three H. P. engine for three years without batteries."

"It is an Ideal engine, with make and break ignition and a Hercules magneto with coil in magneto."

"This engine is used in spraying, runs corn sheller, pumps water, and runs prune grader, and has given no trouble."

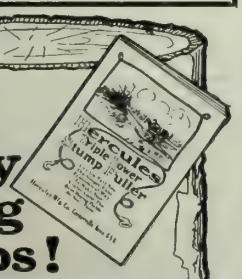


"I have two other engines of different make, one 2½ H. P. on spray outfit, with batteries, magneto and jump spark ignition. In use three years."

"This engine has given a good deal of trouble. Both these engines have same ignition system, and have given trouble where the batteryless has not. I am going to try this magneto on a 11 H. P. engine next summer without batteries."

CARBURETOR.

Do not screw the needle valve down onto its seat with pliers. If you do you may roughen up the seat and cause an uneven supply of gas—you can do this with your fingers.



No Pit
is required with the
Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. They are absolutely water balanced and are self-aligning. More water can be obtained from such wells than with any other type. Built in belted or direct motor driven types. If interested, write for Bulletin.

A Worth-While Corn Crop.

[Written for Pacific Rural Press.]

Four years ago C. L. Jessup of Stanislaus county found that Indian corn planted in sandy soil previously seeded to alfalfa, made enormous yields of silage to the acre and for the next three years he grew enough of it on two acres of such land to fill his 44 ton stave silo.

In the spring of 1915 he had about 11 acres of old alfalfa that needed plowing up, so decided to plant it to corn, cutting what he needed of it for his silo and harvesting the rest for grain. He plowed good and deep in February and kept harrowing it down till the last week in March, at which time the soil was in fine condition for planting.

Seeding was done with a one horse planter, White Hickory King seed being used, planted about two feet apart in rows three feet apart. After planting he harrowed the field twice to kill weeds and after it was up he cultivated once with a one horse cultivator, and kept the larger weeds out by hoeing.

In the parts of the field where the suckers were worst he pulled them off but in other places he did not pay any attention to them. He found though that the suckers were worst where the hills were farthest apart

Along in the fall the stalks seemed to be drying up unduly fast, so a part of the field was irrigated, but when the grain was harvested it was found that the unirrigated land had by far the largest crop of ears. Damage done by the corn worm was overcome by the blackbirds who picked the worms out of the end of the ears before they had time to seriously damage the corn.

The poorest part of the field was cut green and siloed, and in October the grain crop was harvested. After shelling there were 400 sacks averaging 121 pounds each in weight, which was sold for $1.50 a hundred.

Besides the crop of grain and silage, the stalks and the pie melons which covered the field furnished 18 head of dairy cattle and two horses with feed for two months.

While Mr. Jessup has made no attempt to breed up his corn through the most careful kind of selection he has always chosen his seed from the best of the grain and this year he expects to make a test with Eastern and Western grown seed to see whether acclimation is of importance.

WALNUT GROWERS ISSUE STATEMENT.

California harvested a banner walnut crop last year and the California Walnut Growers' Association were so successful in the marketing field that there was but two per cent of the total crop in the State the first of January. Such is the information given out by Secretary C. Thorpe at Los Angeles.

He states that the comparatively low prices which walnuts have sold at this year have undoubtedly stimulated consumption and that it is his opinion that the supply of the association's Diamond Brand will be completely exhausted early in the spring. Under less favorable conditions last year the last cars shipped by the association sold at 17½ and 18 cents.

While it has been almost impossible for the association to secure accurate European reports the past season on account of the war, one of their salaried agents in France, California's largest competitor in nuts, had this to say: "Nearly all of this year's walnut crop (in the shell) is now either sold for interior consumption, for the army principally, or for shipment to America. Since my last cables some five hundred tons more have been or are in course of shipment to the States, but of this quantity a large proportion are in Marseilles awaiting steamer opportunity. It is thus unlikely that any considerable tonnage will arrive in America in time for the Christmas trade. I estimate that not more than 500 to 600 bags of 100 pounds remain for sale at the present time. Of small lots for cracking there are still sufficient stocks available, although my estimates on this year's crop—1500 tons— may prove to be slightly overstated, as in some districts the rendering in meat is small. I should state in this respect that the 1915 crops have turned deceptive. While fine in outside appearance and fairly uniform in size, the meat in general is not fully developed and in many instances the percentage of shriveled and bad nuts is as high as 20 per cent and even more. This is thought to be due to the prolonged dry season in late summer and autumn as when I sampled them in July they were very promising."

It is interesting to note that the importations of walnuts in the shell have been many times lighter during the months of October, November and December this year than for many previous seasons past.

To show the growing demand for package goods the association reports that they have sold over 3,000,000 packages of their Diamond Brand the past year, although this is the first year that they have offered their nuts to the trade in that way.

PEACH ASSOCIATION FORMED.

Dispatches from Fresno state that the peach growers' association was formally organized Wednesday with subscriptions of growers amounting to $350,000. This and contracts for the first year's crop make the estimated assets of the new concern valued at approximately $600,000. It was commonly believed at Fresno after the meeting that the new association will be as great a success as the raisin association.

Four Years' Work With Grades.

Right breeding, right feeding, and weighing and testing of milk bring herd average to 423.9 pounds of fat yearly.

While leaders in the dairy movement may sometimes become discouraged at the apparent lack of interest manifested by dairymen toward improving their conditions through the scales and the Babcock tester, demonstrations like the following sent us by C. A. W. Carver, of Los Angeles, indicate that surprising results are being attained by some toward more profitable dairy practices.

He writes: "Your issue of December 11 contains a very interesting account of a dairy herd in Humboldt county. Such demonstrations are of great value to the dairy industry of the State, as what one practical dairyman can do others can do also.

"Four years ago we began developing a dairy herd at Artesia, in Los Angeles county, following the plan of keeping an accurate record of the production of every cow, breeding only to the best registered bulls, raising all heifer calves, discarding every cow that does not come up to a certain minimum standard of production, and feeding a balanced ration adjusted to the producing capacity of each individual cow. The results have been more than gratifying.

"We have just completed the 1915 year's record of each cow, and give below a true and correct showing of the herd of 60 cows, the lowest one of which in fat production is far above the average of Mr. Trigg's herd, and they are all grades except one, which is a registered Guernsey.

"We would be glad to know if this record can be equaled by any other herd of grade cows of any breed in the State.

"While this appears to be a fine record, yet we expect to keep right on along the line on which we are now working, and believe we will soon have a much larger herd, all of which will exceed a minimum requirement of 400 lbs. of fat per cow each year. When that is attained the average of the herd, of course, will be much higher."

BREED	Age	Months in Milk	Lbs. Fat

WANTS BETTER GOATS.

To the Editor: I would like to know where the Angora goat, originally from Asia Minor, can be bought. It is kept in Switzerland to a great extent. Its mohair reaches to the ground and women's hair goods are made from the best specimens. Is it to be found anywhere in America? Do you suppose that the so-called thoroughbred Angoras that we see here in California are this kind degenerated. I have seen Angora and Kashmir goats with white heavy fleeces 12 and 18 inches long and wouldn't mind having a few like that if they were to be had in this country. The Angoras we have so far hustle in the brush the greater part of the year, require very little shelter and care, and each goat gets about as much grain as the average hen.—M. S., Lassen county.

[The reason that you do not see more Angora goats of your description is that importations from Asia Minor have been very limited, the Turks zealously guarding against exportations in order to gain a monopoly of the mohair business. Restrictions have also been placed on shipments of livestock from Asiatic countries by the United States government to safeguard against contagious diseases. The American type is different from that of Turkey because the original imports were small and delicate, and these were crossed on the common goat to obtain a larger and hardier animal. Although the length and quality of the mohair has suffered somewhat from this crossing, it has produced a goat better suited to our climatic conditions.

Where the finest fleeces are found in Turkey each farmer possesses 20 or 30 head, to which he devotes his entire time, many times living under the same roof with them. Of course the average Californian does not want to take such measures. By selection and proper mating, however, it is possible to work a wonderful improvement in both the length and quality of mohair on native stock.—Editors.]

The U. S. Dept. Agr. averages losses from livestock diseases in U. S. for 30 years at $5,000,000 on account of hog cholera; Texas fever and cattle ticks $40,000,000; tuberculosis $25,000,000; contagious abortion $20,000,000; blackleg $6,000,000; anthrax $1,500,000; scabies of sheep and cattle $4,600,000: glanders $5,000,000; parasites $5,000,000; poultry diseases, $8,750,000; other livestock diseases $22,000,000.

D. W. Wallis, cattle superintendent for the firm of Miller and Lux, has resigned his position. Mr. Wallis was superintendent for that company for about 15 years.

LAYNE & BOWLER PUMPS WIN AGAIN

Layne & Bowler Corporation Gets Largest Single Order Ever Placed in the West---Phoned from Denver---Shipped to Tennessee by Fast Express

IN preference to all other pumps, Layne & Bowler Pumps were chosen by the American Zinc Company of Denver to clear the company's big zinc mines in Tennessee of water. This is the largest order that has ever been placed with a western pumping concern and calls for the immediate delivery of five huge turbine centrifugal deep well pumps, capable of raising 10,000 gallons of water per minute. The big order was placed by long distance telephone from Denver and is being shipped across the continent by Wells Fargo Express, three special baggage cars being used.

The engineers for the American Zinc Company chose Layne & Bowler Pumps because a dependable pumping system is absolutely necessary to dewater the mines. A breakdown might mean thousands of dollars' loss. This great zinc company could have purchased pumps in the east and saved an express bill of $13,000 and perhaps several days' time, but they knew that only Layne & Bowler Pumps could do the work quickly, efficiently and inexpensively. Layne & Bowler Pumps, made in Los Angeles, are highly recommended by the world's leading hydraulic engineers. Western ranchers invariably select these pumps.

Our free catalog No. 25 tells all about Layne & Bowler Pumps

Layne & Bowler Corporation

More and Better Hogs in California.

[Written for Pacific Rural Press.]

ALFALFA FOR HOG PASTURE.

While some breeders feed alfalfa hay to hogs, they all admit a great waste. The waste makes good bedding but rather expensive. L. F. Killenbeck of Orland has noted that hay is a better form than to cut it and feed green in pens because the pigs eat so much at once that they cloy on it and don't like it afterward. Henry Webb of Madera has brood sows in a big barn in which the pigs play about in the hay, keeping clean and cool. C. E. Barrows of Los Molinos notes that they waste 2-3 of alfalfa hay, but eat all of it if chopped and softened with steam or water, mixed with a little mill feed.

Best Fed as Pasture.—Alfalfa pasture is the great way to feed this forage. The hundreds of breeders who do this with no damage to the alfalfa, prove the practicability of this plan. As a rule, they fence off several fields and change hogs from one to the other before damage is done. L. D. Collins of Denair has 60 sows and shoats on 5 acres fenced into six yards. G. A. Smith of Corcoran has 80 acres in half a dozen fields, for several bunches of hogs. Seventy-five brood sows kept a trifle too fat on 20 acres of alfalfa and 60 acres of grain stubble from June to September and later. Joe Carrico of Orland had 67 head of shoats and old stock on 20 acres and had to mow it in order to keep it tender so they would eat it. L. W. Barnhart of Turlock, with seven gilts and their half-grown litters eating sweet potatoes, had to mow the 4-acre pasture frequently to prevent the alfalfa becoming too old and tough. Mr. Tweed of Willows is sowing 180 acres alfalfa in order to go into hogs heavily next year; he has over 200 head now.

Two sows and six half grown pigs forage happily on a half acre for A. L. Stephenson of Los Molinos, being shut up 24 hours at each irrigation. E. B. Chase of Orland has two sows and nine pigs from one of them in a panel pen 10x15 feet. This is moved up one side of an alfalfa check 30 feet wide and 100 yards long and back along the other side, by which time the alfalfa is ready for another round. He irrigates every two weeks in summer, leaving the hogs in the water. A platform would obviate this objection, which is not serious because the soil drains well and requires only three hours to run the water through.

REPORT OF COW TESTING ASS'N.

[Written for Pacific Rural Press.]

One of the best indications of the improvement in grade cows in the State is the continued high monthly reports of the various county cow testing associations.

S. F. Bonner, secretary of the Gridley Cow Testing Association, sends us the records of cows in that association which made over 40 pounds of butterfat for the month ending December 31st.

Mr. Bonner informs us that the cow standing third in the above list has produced 10,622 pounds of milk containing 362.2 pounds of fat in six months and 11 days, which is surely a mark worth working forward to.

Breed	Pounds of Milk.	Per cent of fat.	Pounds of fat.
Holstein	1280	4.5	62.10
Holstein	1095	4.7	51.46
Holstein	1709	4.0	48.36
Durham	1020	4.6	46.92
Durham	971	4.3	40.89
Holstein	1230	3.6	44.28
Durham	1240	3.3	40.92

ARE DRAFT HORSES SAFE?

To the Editor: I have bought two shares in an imported Percheron stallion and have a chance to buy a home-raised Percheron mare that is registered for $600. The mare weighs 1950 pounds and the stallion 2,000. Can you tell me whether horses are going to be good property for some time to come, or do you think that the truck is going to do away with them?—R. E. H., Manteca.

[If this mare is sound and a sure breeder we should say, buy her, that is if she is a comparatively young animal. We take it that you contemplate purchasing her for foundation purposes, and if this be true we would advise you to pay more attention to the above points than to weight, as it is just possible that she is carrying more flesh than is desirable for breeding animals. Of course no one can tell at this distance whether she is worth the money or not. If you are not familiar enough with horses to find defective parts, get a good horse man or veterinarian to give his opinion.

It is now generally conceded that the truck is here to stay, but we believe there will be many uses for the heavy horse, in city and country, for a great many years, which will continue to make their raising profitable, and especially practicable, to the farmer breeder.—Editors.]

RAISING THE RUNT PIG.

In commenting on his method of raising runt pigs successfully, O. G. Marlsbary, of Parlier, Fresno county, writes: "I breed two sows as near the same day as I can. I put them in the same pen together several days before farrowing time. After the pigs are born they will mix together and the sows can't tell their own from the other's. In a few days the strong pigs will throw the weak ones out and they soon show their weakness. Then I take the sow that had the smallest litter and put her in a pen by herself and give her the weak ones, and if there are still too many with the other, one or two strong pigs can be put with the former sow and in a very short time there will be no runts; in fact in 10 days you can't tell the runts from the others."

W. H. Rough of Riverside county is reported to be considering the moving of his purebred herd of Poland Chinas to Kings county in the near future.

D. L. Henley of Lemoore reports Duroc-Jersey hogs as follows: One boar to Chas. H. Benner, Parlier; one boar to E. E. Brown, Lemoore, and one gilt to E. L. Hotchkiss of Lemoore.

Empire Mechanical Milker

The firm and gentle massage of the teats by natural atmospheric pressure coaxes the cow. She responds generously—in many cases gives even more milk than before. No compressed air used. No chance for sore, inflamed teats or udders. No dirt, germs or stable air comes in contact with the milk. One double or two-cow Empire unit takes care of 20 to 30 cows per hour. One man can attend to two double units. Everything rapid, clean, sanitary. Installation simple, easy and inexpensive. Only one tank—one pipe line.

Let us send you full description and pictures of Empire Milkers and Empire Cream Separators that are making good in many fine dairies. Ask also for our offer on the Empire Gasoline Engines and Empire Star Feed Mills.

My range-raised bulls this year are the finest lot I have ever had.
THEY HAVE GRAND CHAMPIONS BEHIND THEM.

Draft Horse Future Bright.

Writing to this office, Wayne Dinsmore has this to say of the horse outlook: "1916 ushers in what promises to be one of the most favorable seasons horse breeders have ever faced. Draft horse producers have especial reason to feel optimistic. The marked improvement in the industrial world has brought transportation facilities again into active service and all transportation agencies — railroads, motors, and teams—are being used more freely than for two years past. Draft geldings have been in good demand at higher prices, and the farm demand for useful draft mares is already so strong that horse dealers are being eliminated as buyers of good draft mares.

"Purebred draft horses are also in keen demand. The elimination of imports since August 1914 have resulted in a marked stimulus to horse breeding in this coutnry, and more satisfactory prices have been paid to the breeders and raisers of good American bred draft colts than at any time in our past history.

"The total number of horses on farms, April 1st, 1910, was 19,833,-113 head, and the Government estimates for Jan. 1st, 1915 credited this country with 21,195,000 head,—an increase of 6.86 per cent over 1910.

"From these and other statistics we gather that after replacing the stallions which are annually retired from the breeding ranks and replacing the grade stallions which are now in use with purebred animals, we actually need around 7,000 good draft sires annually to fill the services of horses dropping out of service.

"During the fiscal years of the various draft horse record associations ending in 1915, approximately 12,000 American bred draft horses were recorded. This includes both sexes and all ages of Percherons, Clydesdales, Belgians, Shires, French Draft and Suffolks. Less than half of these were stallions so that we are producing annually now, less than 6,000 draft stallions. It is recognized by all horsemen that at least one-fifth of the stallions that are recorded are not good enough to be of any real service in improving the draft horse stock of the country. It therefore follows that we are really producing less than five thousand good pure-bred draft sires annually, when we need at least 7,000 per year, at the lowest calculation.

"Good blood and liberal feeding will pay better in draft horses than in any other class of stock, always providing that a man buys no more mares than he needs in his farm operations, and exercises good management—essential to success in any line."

THE MANTECA DAIRY.

[Written for Pacific Rural Press.]

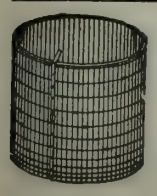
There have been many large purebred establishments started in California in recent years, but few where the foundations have been more prominently or wisely laid than on the old Henderson ranch, now known as the Manteca Dairy Farm, 35 miles south of Sacramento near the little town of Kennefick.

The Henderson family have farmed the 600 acres contained in the ranch since 1850, practicing the usual early day practice of raising wheat and barley till those crops became unprofitable.

In more recent years the Henderson family decided that dairying was more constructive and accordingly the old buildings were torn down and modern milking barns, silos, implement sheds and calf nursery erected, with the aim of making the plant one of the finest in the State. Irrigation water was developed by the sinking of wells over the ranch and the installation of pumping plants. The water in these wells rises to about 20 feet from the surface and power is furnished by a large porable gasoline engine.

Holstein cattle, hogs and chickens were decided upon as the most promising combination for the new undertaking and no expense has been spared in starting the purebred Holstein herd, which is to be of first importance, on the highest possible level.

This is best shown by the quality of the three herd sires which have been purchased. The senior sire of the herd is King Pontiac Segis Inka, a son of the bull King of the Pontiacs, who has 161 A. R. O. daughters, leading all other sires in A. R. O. daughters and the first sire to have a two-year-old daughter to produce one thousand pounds of butter in a year, also the sire of the only 44 pound cow and Segis Inka 3rd, a two-year-old world record heifer from De Kol 2nd's Butter Boy 3rd, who has 118 A. R. O. daughters and more A. R. sons, who have had more 30-pound daughters than any other sires of this breed, and Segis Inka, the good old cow that made King Segis famous.



The junior bull of the herd will be King Pontiac Wayne Segis, a half brother of King Segis Pontiac Alcartra, the $50,000 bull, and King Segis Pontiac Chicago who at three months of age sold for $20,000. He is a son of King Segis Pontiac who has more sons at the head of important herds than any other bull in the United States. His dam is Elsie Veema Wayne, a thirty-pound daughter of Sir Veeman Hengerveld, a sire who has a greater per cent of thirty-pound daughters than any other bull of the breed. This young sire is a great acquisition to the State of California.

A third young sire in this herd is King Lillian Walker Segis, a son of the King of the Black and Whites, and Lillian Walker 2nd. His blood traces back to Colantha Johanna Lad, a sire attracting much attention through his high testing daughters, and King Segis, the best bull of the breed. This young bull's nearest fifteen dams average over thirty pounds of butter fat a week and the thirty nearest dams average over twenty-seven pounds per week.

The company has purchased some A. R. O. daughters of the King of the Pontiacs, King of the Black and Whites, King Lyons, King Walker and many other sires of equal importance. It has also several thirty-pound cows and expects to have many more in the near future. They have also bought several families headed by thirty-pound dams.

All the members of the family take a lot of interest in the place and all the milkers and herdsmen co-operate with the company in their efforts toward a high standard in dairy husbandry.

J. B. McKindly of Acampo is gradually replacing his grade cows with registered Holsteins.

REDWOOD TANKS SILOS
Water Troughs, Windmills, Frames, and Towers.
Steel and Wood.
Prices the lowest.
BROWN & DYSON
640 So. Center St.,
STOCKTON, CAL.

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

DAIRYING.

Over 900 cows have been signed up for a cow testing association which is being proposed in Merced county.

Buyers from Los Angeles are reported to have shipped 200 head of heifers, mostly Holsteins, from Tulare county last week.

Twenty-seven head of Holstein bulls were sold at auction at El Centro, Imperial county, this month, which brought an average of $208.88 apiece.

A. H. Pozzi of Monterey county has purchased the half interest of his brother A. Pozzi. This is one of the largest cheese making concerns in the Salinas valley.

The Oakdale creamery has just completed the installation of new machinery which will enable them to increase their output from 1400 pounds to a ton a day.

The supervisors of Imperial county announce that they are going to purchase several purebred dairy bulls in order to promote the livestock raising industry of that county.

The erection of a cheese factory at Salida, Stanislaus county, now seems assured. W. S. Carpenter of Fresno will build the factory, which will not be a large one to start with.

The California Central Creamery are preparing to ship two carloads of butter from their plant at Eureka, at an early date, to fill a part of their government contract, recently awarded them.

A purebred Holstein, Ruby Kathleen Aaggie Robles, owned by the Santa Ysabel ranch at San Luis Obispo, gave over three gallons of milk for two years and as much as six gallons when she was fresh.

San Francisco and Los Angeles capital has been enlisted to increase the capital stock of the Imperial Valley Creamery company which will enable the concern to expand, especially in the marketing of their butter.

The Holstein breeders of Arizona have formed an organization to be known as the Arizona Holstein-Friesian association. A meeting will be held at Phoenix, January 19, to perfect the organization and elect officers.

Because the Nevada-California-Oregon railroad cannot afford to furnish refrigerator cars to him, H. C. Watson, creamery owner at several points in Lassen county, will hereafter ship his butter to California points by parcels post.

Estimates made by the Wells Fargo Express agent at Newman, Stanislaus county, are that the cream shipments from that town the past year have increased at least 10 per cent. The average for 1915 was about 300 cans daily.

M. H. Tichenor and H. S. Fleishhacker are reported to have leased 600 acres of the Stanford land at Palo Alto and will establish a herd of registered Holsteins on the property at once. They will build a modern dairy barn having a capacity of 300 head.

The Central Forest company are to become active in the Holstein breeding game at their ranch in Glenn county, if present plans carry. They purchased 22 head of Holsteins of the Carnation Stock Farms and expect to enlarge both their dairy and hog herds.

Representatives of the University of Nevada and several State veterinarians are looking over dairy cattle in different States with a view of buying a herd of 50 registered dairy cattle for the State prison at Carson City. The State has appropriated $10,000 for the purpose.

The N. H. Locke company report the following monthly records for cows in their herd: Gertie's Fox Alene, 56.1 pounds of fat; Fern's Norma, 47.2 pounds fat; Dereen's Lassie of L., 65.2 pounds fat; Lady of Lockeford's Midget, 61.6 pounds fat; Fox's Powers, 54 pounds fat.

The Santa Ysabel dairy of San Luis Obispo has recently sold two carloads of grade Holsteins. P. A Welty, who has charge, has found the best producers by a year of tri monthly milk weighing of three days at a time and monthly fat tests They have 10 cows out of one of Aralia De Kol's sons.

H. R. Thisen of Lodi has just completed the erection of a 250 ton silo and expects to build a modern dairy barn soon with a capacity of two strings of cows. He will breed purebred Guernseys and Holsteins and will be equipped to either sell whole milk, make cheese or sell his butterfat to the creamery.

Oregon "wet goods" consumers will turn from their usual beverages to buttermilk, now that the State law has put a ban on booze dispensers, according to prominent creamery men of that State, who claim that the creameries are having a bigger demand for buttermilk than they can supply.

Stanislaus county still holds the State butter production record for counties, according to the annual report of Secretary Andreason of the State Dairy Bureau. During the year 1915 that county produced 9,973,320 pounds, or a gain of almost one and three quarter million pounds over the production of 1914 in that county. Imperial county again holds second place with 6,334,316 pounds, a gain of 624,029 pounds over 1914. Humboldt county gained 339,983 pounds during the year, producing a total of 5,591,870 pounds. A more complete report of this will appear in next week's issue.

SWINE.

Two carloads of hogs were shipped from Tulare county to San Francisco one day last week.

The final shipments of hogs from Potter Valley, Mendocino county, were made early this month. The total shipments from there this year exceeded expectations.

J. E. Thorpe of Stockton has just received from C. Wallace of Weisner, Nebraska, a choice Duroc-Jersey sow pig, which will be used in strengthening his herd.

Biddle and Russell of Hanford shipped eight cars of hogs to San Francisco last week, making a total of 34 cars for the season that they have shipped to Los Angeles and San Francisco markets.

The Laughlin ranch near Windsor, Sonoma county, has been purchased by H. R. Sander of San Francisco who expects to engage in the breeding of registered Berkshires on an extensive scale. J. E. Hall is to have charge of the herd, which will contain 100 brood sows.

An experiment is being carried on at the Spreckels ranch in the Salinas valley with beet pulp for hog feeding. The experiment has not been conducted long enough to prove definite results, but is being watched with considerable interest in view of the increasing amounts of pulp which are available in that section.

BEEF CATTLE.

The January meeting of the Napa County Livestock Ass'n was held at St. Helena on Jan. 8.

The State Board of Health appointed E. Ross and Dr. R. A. Peers as delegates to the Interstate Conference on Rabies to be held in Winnemucca, Nev., on Jan. 11.

The Cuyama ranch in San Luis Obispo county is to be stocked with Arizona cattle recently brought for the purpose by Supt. E. W. Black of the Santa Margarita Ranch.

The Secretary of Agriculture has authorized the grazing of 30,550 cattle and horses, 2300 swine, and 99 sheep and goats in the Sequoia National Forest for the grazing season of 1916.

The famous Shorthorn bull, "Champion of Scotland," recently purchased by the Paicines ranch, Paicines, from Dan R. Hanna of Ohio, is now en route to its new owners.

G. W. Maxon and J. Carty of Los Angeles have leased the Wheeler ranch near Tulare. The ranch consists of 1500 acres, 220 being in alfalfa and the rest used for grazing purposes.

D. M. McLemore of Merced county purchased 524 head of cows and heifers and over 20 bulls in the Klamath Falls section of Oregon last week and shipped them to Merced county where they will be used for breeding purposes on a large acreage of the old Chowchilla ranch.

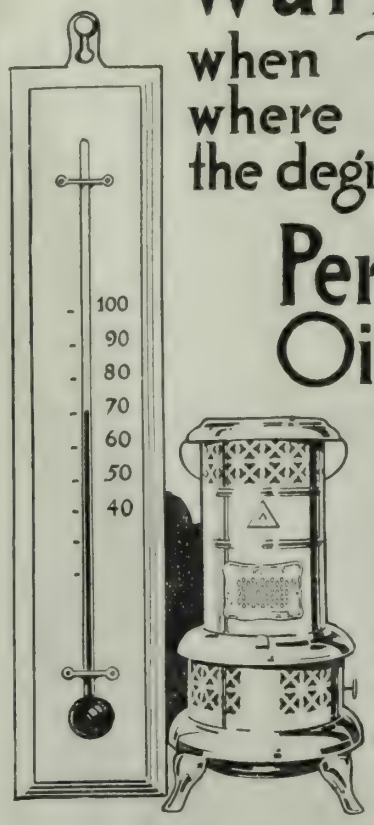
R. M. Dunlap, who is well known in California beef cattle circles, through past association with some of the most prominent purebred herds in the State, has gone into the livestock commission business with H. L. Murphy of Sacramento county. Mr. Dunlap has just returned from the East, where he made heavy purchases of registered cattle as follows:

One carload of Shorthorn bull calves for Parrot Inv. Co., Chico; 10 Shorthorn cows and a $600 bull for W. H. Hammond, who is establishing a purebred herd and erecting modern buildings on his 2000-acre farm near Chico.; a carload of bulls to Russ Bros., Ferndale, and other smaller orders.

Mr. Dunlap states that good bulls are scarce and high in the East, particularly Herefords, and that he is advising customers to purchase bull calves to hold over till next year, when he thinks values will be much higher. He will make another trip east shortly to fill orders now on hand, this time to Kansas City and adjacent points.

HORSES.

A new intestinal parasite of the horse has been discovered by Irwin C. Schumacher, a recent graduate of the University of California.



Wm. Casey and A. G. Almstead of San Lucas have recently purchased from Ruby & Bowers, Davis, a fine Percheron stallion, "Ingrat."

It is stated that the allies have purchased 195,000 horses from the National Stock Yards at East St. Louis, Ill., at a cost of $34,000,000. The British buyers have discontinued their purchases at that point.

SHEEP.

A report from Marysville states that a rise in the waters of Dry

creek caused the drowning recently of 1300 sheep belonging to Andy Robson.

Practically all the hay in Surprise Valley, Modoc county, has been purchased by the sheepmen of Lake county, Oregon, who are feeding their flocks in that section this winter.

Sixteen sheep owners living north of Cloverdale and in southern Mendocino county have in the last 12 months paid out themselves $1,500 in bounties and other protection against coyotes.

SILAGE FOR SHEEP, HORSES AND MULES.

Moldy or extremely sour corn silage is a dangerous feed for sheep. Eleven ewes were lost in an experiment at the Missouri Expt. Sta., one week from accidentally feeding moldy silage. A ration of corn silage, clover hay, and grain proved to be the most efficient means of utilizing silage.

Ten yearling mules, weighing approximately 650 lbs. each, were fed for 90 days an average daily ration of 6.5 lbs. of ear corn, 8.6 lbs. of mixed hay, and 4 lbs. of corn silage. The mules made a gain of only 4.8 lbs. during the period. No ill results were seen from the use of the silage, but the mules did not consume large quantities of it. This it is thought may have been due to the fact that the silage was made from rather immature corn.

Successful experiments in feeding silage to horses and mules, conducted at the North Carolina and Pennsylvania stations, show that corn silage should always be fed in combination with other feeds, and that under no circumstances should spoiled silage, either moldy or rotten, be fed to horses and mules.

A LIQUID CATTLE BRAND.

A simple and apparently humane method of branding dairy cows, so that they may be more easily identified in weighing and testing their milk, is to paint the number on their hips with potassium hydroxide. The liquid can be applied with a small brush, and like other caustic, burns its way slowly through the hair and hide, leaving a brand that is easily distinguishable, until the hair from the sides grows over it. If the brush is a small one it sometimes requires a second burning in about two months to make the scar permanent.

Mr. A. B. Goodwin, of Manteca, San Joaquin county, has branded his entire herd in this manner and states that the cows do not seem to suffer from the treatment and that the burns soon heal over.

The San Francisco Wholesale Dairy Produce Exchange has issued a report regarding receipts of butter, eggs and cheese received in San Francisco during the calendar year of 1915. It is stated that 18,887,317 dozen eggs were received; the yearly average price on fresh extras was 31.21 cents and on pullets 26.79 cents per dozen.

LIVESTOCK DIRECTORY.

DAIRY CATTLE.

REGISTERED HOLSTEIN SERVICE BULLS—Ages 4 to 5 years. From excellent families. Prices on application. Miller & Lux, Colony Farm, Dos Palos, Cal.

28.9 lb. Holstein Bull 14 Months Old $500

His Dam, Korndyke Ormsby 2nd, as a 5-year-old, made in 7 days 28.91 lbs. butter fat, test 4.26. His Dam's Dam, Korndyke Ormsby Hengerveld, has a 26.74-lb. record and three A. R. O. daughters. In his sire he combined the blood of Creamelle Vale, second only in milk production to Tilly Alcartra, official record 1155.85 lbs. of butter from 29,591.7 lbs. milk, and the great sires Dutchland Sir Peiterje Hengerveld, who has 15 A. R. O. daughters; Pieterje Hengerveld Count De Kol with 49 A. R. O. daughters and Pontiac Butter Boy, one of the real great sires of the breed.

The Bull is a dandy, straight, nicely marked, being half white. He is just what you are looking for and is worth twice what I am asking.

Write, or better, come and see him.

F. H. STENZEL, San Lorenzo, Cal.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

WARTS ON TEATS.

To the Editor: I have a young cow that has small long warts on her teats. Sometimes they bleed, making it annoying to milk her. What should I do?—W. S. L., Fresno.

Paint the warts with a 3 per cent solution of Chromic Acid, twice daily till they disappear.

PERIOD OF HEAT.

To the Editor: Is there any way of telling when a cow will come in heat? Some tell me the 9th to 25th of each month. I have a cow that had her second calf September 17. I believe she was in heat about November 5, but she hasn't shown any signs since. Can you tell me when she will come in again?—J. E. B., Fresno.

The period of heat or oestrum in the cow is every 18 to 21 days.

RHEUMATISM AND GARGET.

To the Editor: What can I give to a cow that has rheumatism in hind quarters? She is hardly able to move after resting. Also how can a slight case of garget be cured? —A. J. G., Princeton.

Give this cow one dram each of Sodium Salicylate and Hexamethylamine dissolved in water, three times a day. For garget use potassium iodide in dram doses, three times a day, in water.

CATTLE LOSE EYES.

To the Editor: I have three yearlings that have gone blind in the left eye, the eye-ball turning blue. They have been out on pasture for several months. Do you know of any cattle disease that would turn them blind in this manner?—J. I. S., Los Gatos.

There is a disease called epizootic keratitis which would leave the eyes as you describe them. However, this condition would infect the whole herd. Very probably these animals got foxtails in their eyes.

INFECTIOUS DYSENTERY.

To the Editor: Some of my calves die when about a month old. Considerable clotted blood passes from the rectum, the duct is watery, dark and bloody. They eat considerable but not with much satisfaction, and have a high fever. I feed eight pounds skim milk with middlings and alfalfa hay. They usually die in eight to ten days after taking sick. What is the cause and treatment?—S. R., Modesto.

This is infectious dysentery. Give the following every hour for five hours, then every two to three hours as needed: Tincture of Capsicum 10 drops, Compound Tincture of Gambir ½ oz., and one 30 grain tablet Sulpho-Carbolates. If calf is very weak give a wine glass of brandy.

LOST QUARTER.

To the Editor: We have a cow that has lost a quarter. When she freshened about three weeks ago we attempted to regain the quarter by the use of a milk tube. We drained the teat three times and removed the tube, but the opening closed up each time and we had to make a new one. We finally decided to leave the tube in, but she lost it in four days. The quarter is now badly swollen and sore. She eats well and gives about half the amount of milk she did before we commenced doctoring the teat. What treatment would you suggest?—E. H. S., Delevan.

Get a teat plug of the self retaining type and leave in between milkings until opening heals and remains open of itself. Be sure to boil the plug each time before re-inserting.

COMPACTION.

To the Editor: we are having considerable trouble with our cows. The local veterinarian called it compaction of the stomach. He prescribed Epsom salts and linseed oil, but the cows refused to eat and continued to be droopy, finally getting over the spell in about three weeks but almost going dry. We feed alfalfa hay, beet pulp and bran, twice daily. We have had two such cases in four weeks. What should we do? —C. S. D., Grass Valley.

The following treatment for impaction is the most successful one the writer has used. Withhold all feed from the cow until she begins to chew her cud. This may take 4 or 5 days, or even longer. Don't let them have even small amounts of feed, but all the water they want. Give ½-dram doses of fluid extract Nux Vomica every four hours and one dram of Salol three times a day during this period. When they start chewing their cud again, give one quart raw linseed oil and bring them back to full feed gradually.

FISTULA.

To the Editor: In your issue of December 25, under Veterinary Queries and Replies, A. M. V., Nevada, asks for a cure for fistula of the withers. Your veterinary says "the knife and only that." Now I have no desire to quarrel with the doctor, but for the benefit of your subscriber I beg to say that there is a cure. If he will write Flemming Bros., Chemists, Union Stock Yards, he will get the medicine that does cure most cases of fistula. It is a proprietary article and may not be ethical in a professional sense, but it will cure a man's horse.—J. A. Romine, Kings county.

If the writer were a strictly ethical man he would in all probability not be trying to alleviate disease through the columns of a paper, but as ethics are almost unheard of, to the writer's regret, in the veterinary profession, he does not feel that he is transgressing in giving to the readers of this paper the best that he knows as a veterinarian. The writer, however, does not believe in patent medicines. There are many formulas that are used for the cure of fistula, but none of them are infallible and the experience of veterinarians as a whole indicates that operative treatment in this condition is the only method which will give a radical cure in the most economical way. To the writer it seems more sane to lay an animal up for a maximum of two months and get a cure than to use some preparation for periods varying up to a year and finally wind up where the start was made. It is a fact that in a small percentage of cases drugs alone will do the work, but had the knife been used in these cases a cure would have been accomplished in a much shorter time.

STATE SWINEBREEDERS' SALE.

We are advised by J. I. Thompson, secretary of the California Swine Breeders' association, that there have been 111 head of hogs consigned for the auction sale which is to be held by the association at Sacramento January 27. Included in the offering will be Berkshires, Poland Chinas, Duroc Jerseys, Chester Whites, Hampshires and Yorkshires. A banquet will be held the night before the sale at the Travelers' Hotel in Sacramento, which should be well attended.

NOTICE!

Wishing to devote my whole time to other business, I have decided to sell out my

Shire Stallions at Cost

in order to dispose of them quickly. Included are the stallions which have been at the head of my stud for the last two seasons. All are sound and good stock horses.

I can also spare one pair of "in foal" mares and three stallion foals.

If you are in the market, do not miss this opportunity.

A Ranch Devoted to Purebreds.

[Written for Pacific Rural Press.]

In many ways the livestock operations on the Hopland Stock Farm in Mendocino county are unique in character and large in scope.

In the first place all of the various purebred undertakings were preceded by experience with grades and, like the time-worn expression, "the proof of the pudding has been in the eating." Outside of all ambition ot maintain the finest livestock breeding establishment in the West on his Hopland ranch, A. W. Foster and his sons have been brought into the breeding fraternity largely through practical demonstrations of the worth of purebred sires in their own operations.

For years Mr. Foster's Hopland ranch was used primarily as a race horse breeding farm, but today all energies are expended in developing herds, flocks and studs made up of Shorthorn cattle, Berkshire swine, Shropshire sheep, Holstein cattle, Hungarian ponies and poultry. In all fairness to the other branches, with the possible exception of poultry and hogs, the Shorthorn herd is of commanding importance because it naturally presents desirable opportunities for development.

Started some seven years ago on what is known as the Lakeview ranch, located in Marin county, the present herds comprise about 100 head. A great deal of care was exercised in purchasing the foundation cows, and the result of that care together with intelligent selection of herd sires since has had much to do with the present excellence of the young stock.

From this Lakeview foundation was secured a large number of heifers, sired by the bull Tule King, a son of the well known bull King Edward. These heifers were taken to the Hopland ranch to act as the nucleus of the present herd there, being bred at first to the bull Music Master, a bull of remarkable breeding, now dead. At present the herd sire is Right Choice, a fine individual sired by the bull Choice Goods.

The policy is to keep all of the female offspring for enlargement of the herd at Hopland, intending eventually to have the entire herd at that place.

In line with this program the ranch has been equipped with suitable feed sheds, barns and silos. Several hundred acres of this ranch is bottom and the balance hill grazing land. Part of the bottom land has been seeded to alfalfa while the rest is partly farmed and partly used for pasture, furnishing winter grazing for the cattle, which is supplemented with chopped alfalfa hay and alfalfa silage.

There are five silos on the ranch, only one of which is filled with corn, the others being filled with first cutting alfalfa. During the winter the cattle are housed at night, but are out in the fields during the day. For summer pasture the hills are utilized, they being well fenced and cross fenced, providing an abundance of natural grasses.

As we inferred at the beginning, the purebred herd of Shorthorns is the outgrowth of former operations with grade cattle on the Lakeview ranch. For a great many years the cattle on that ranch were bred up by the use of purebred Shorthorn bulls, and as a result of that continuous breeding two-year-old steers were turned off last year averaging 1069 pounds each. While it is true that this was accomplished on exceptionally good Italian rye grass pastures, seeded 20 years ago, no grain or other concentrates were fed, and Mr. Foster believes that these results are the best form of arguments for the purebred sire.

WHERE ARE STOCK YARDS?

To the Editor: Are there stock yards at any of the markets in this State, where I can ship stock at any time, like the Kansas City and Chicago markets? Are there stock buyers and commission men, and if so, will you give me their addresses? Which is the best market place in this State?—H. G. N.. Dinuba.

[There are stock yards both in Los Angeles and San Francisco, but not in the sense you mean. The railroad companies maintain stock yards at San Francisco, in which stock can be held and feed purchased, but we would not advise you to do so. The only market where this condition does not exist on this coast is at Portland, Oregon, where a company known as the Portland Union Livestock Company maintains stock yards such as the ones maintained in Kansas City and Chicago. These yards provide for farmers sending their stock direct to market, where they are purchased at the highest bid made by the various packers' buyers. Provision is made at those markets for feeding the stock as long as the farmer sees fit, or till the market price meets with his approval, he, of course, standing all expense of feed, etc.

There are practically no livestock sold in this manner at the California markets with the exception of a small percentage of hogs, which are sometimes consigned to the packers, relying on their integrity for a fair price. Country buying is the rule, and unless you have carload lots to sell it will not pay you to try to ship to either San Francisco or Los Angeles direct. In that case you should correspond with one or more of the large packers, who will either send a buyer to your farm or advise you how they can best handle your offering.

Except for the possible difference in freight rates, Los Angeles and San Francisco prices correspond very closely, a slight variance sometimes occurring according to the needs of the local conditions, which cannot be overcome where each sale is a strictly private transaction.—Editors.]

MOLDY SORGHUMS.

Late harvested sorghums, especially feterita, are much harder to keep from heating in the sack than those harvested earlier in the fall.

Some of the farmers in the southern part of San Joaquin county who delayed planting till well along in the summer last year found it exceedingly difficult to store their grain after harvesting. When sacked and put into piles, the grain absorbed moisture from the air badly, although covered with heavy canvas in damp weather. The result was moldy grain.

In some cases it was taken directly to the mill and run through a fanning mill. This lowered the temperature and by piling afterwards in tiers, with air space on the sides, the grain kept in good condition.

This work is unnecessary when the crop is planted early enough in the season to permit of thorough ripening in the head by the middle of September.

FIRST SEMI-ANNUAL SALE
OF
Kings County Poland China Breeders' Association
will be held at
The Fair Grounds, Hanford, Calif.
Saturday, Feb. 5th, 1916.
On this date there will be one hundred and fifty head of Registered Poland Chinas sold, consisting of
Bred Sows, Bred and Open Gilts
and a number of High Class Boars
Some of the best animals from the leading herds of Kings County will be sold without regard to price or value.
This sale will be absolute AND WITHOUT RESERVE.
No protection measures of any kind will be permitted.
Sale under cover and will be held, rain or shine.
CONSIGNORS:
M. Bassett, Wm. Bernstein, J. A. Crawshaw, Oscar Dimmick, T. J. Gilkerson, J. D. Ross, Geo. A. Smith, W. D. Trewhitt

GRANDSONS OF TILLY ALCARTRA
At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.
We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Seasonable Hints for Hatching.

To the Editor: Last fall as a beginner I took your advice and brought out two settings of chicks. No doubt numerous others, on a large or small scale, took your advice. Mrs. Swaysgood gives seasonable hints for spring hatches. Dare I suggest your giving occasional seasonable hints on fall hatches, to help at least the new hands, to bring their chicks on successfully through to a finish.—J. S. A., Los Angeles.

[Answered by Geo. H. Croley.]

If our correspondent had stated some trouble he was having, it would be much easier to offer advice or give seasonable hints on rearing fall hatched chicks. The best adviser in any difficulty is usually one who nas had a struggle with disappointments before gaining satisfactory results.

In handling fall hatched chicks we had so little trouble, as compared to the exacting attention we found necessary in raising late spring hatches, that we are puzzled to know what to write. To be sure, we were careful with our fall chicks and gave them ample attention; but the provisions against rain, cold, and natural winter conditions, while different required no more effort or expense than to provide shade, cool water, protection from blighting north winds, etc., for the growing spring hatched chicks. And when proper preparation for winter was made it invariably produced joyful results, whereas on the other hand it often seemed that no matter what we did for them in July and August, the chicks hatched in April and May—and sometimes March—just refused to thrive.

Perhaps a hint or two may be worked into this reply by relating an experience we had about twenty-five years ago. In September we moved our plant from a "winter swamp" to higher ground a mile distant. We first built a cottage, incubator house, and moved everything but the brooder house, leaving this until we were more comfortably settled. The first week in October we filled the incubator with about 500 Brown Leghorn eggs, producing not quite 400 strong chicks after disposing of a very few weaklings not worth rearing. In the meantime unusually heavy, early rain prevented moving the brooder house.

This was awkward, but we met the emergency by brooding the chicks in apple boxes, about 50 chicks to each box. A single thickness of clean grain sack was placed on the bottom of each box and the chicks were put on this; a similar piece of sacking was laid on the top of each box. At night these boxes of chicks were stacked in the incubator house containing incubators in operation; each alternate box was turned half way around, affording ventilation through the sack covering of the two portions of the boxes that extended beyond the box on top of it.

During the day these boxes were carried outdoors and each placed in a run about 5 feet wide by 8 feet long and two feet high, made by placing two 12-inch boards on edge, one above the other. At the back end, a portion of these runs was covered with a three board Arkansas roof. Under this roof the boxes were placed after the chicks were dumped into the runs, which were carpeted with short, young grass. When a storm occurred, they were scooped up in double handfuls and replaced in the boxes. If a severe and cold rain, the boxes were covered with the sacking, otherwise they were left open on top.

Five or six of these fowls were killed by varmints and two, when about half grown, died from some unknown cause, but the others grew into splendid broilers or breeders and large, thrifty pullets.

All this required much time and care; the brooder house was so much more desirable that we let nothing stand in the way of moving it before another hatch came off. These chicks were at first fed dry mixed infant chick feed and later with mixed whole grain and moist mash. Dry mash feeding had not yet become popular.

POULTRY NEWS NOTES.

By Geo. H. Croley.

A poultry association has been organized at Ramona, San Diego Co.

At the Modesto poultry show the silver cup for best display of White Leghorns was won by McHenry Poultry Farm.

Nearly all the Bronze Turkeys entered in the Exposition poultry show by eastern exhibitors were sold to Pacific Coast breeders.

We have recently received enquiries for Gray African Geese, White and Silver Laced Wyandottes. Who has them for sale?

A lot of 206 cases of Chinese eggs, the first lot to arrive since Sept. 10, 1915, reached San Francisco on the steamer Hazel Dollar on Dec. 29.

There has recenly been some enquiry for Narragansett turkeys that were once quite popular in California. This variety is not so inclined to wander as the Bronze turkey and for that reason they are better suited to small ranges near villages or in thickly settled country districts. There were fifteen entries of this breed at the Panama-Pacific Poultry show but were all exhibited by eastern breeders.

Poultry Breeders Directory

MAHAJO WHITE ROCKS—Incubator Chicks, $25 per hundred. Hatching Eggs $10 per hundred. The best all-purpose fowl for farms and the most profitable one. Lay well and consistently; best for capons and broilers. Beautiful snow white plumage. Gentle dispositions. Colonize them in your orchard and reap double profits. Send for catalogue. At Panama-Pacific Poultry Show were awarded sweepstake on Cock (295 Egg type), as best utility bird in show—200 Birds competing. Mahajo Farm, Box 597, Sacramento, Cal.

BABY CHICKS—All sturdy youngsters from good stock and hatched right. Rhode Island Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Orders booked now for delivery any time to suit you. Campbell Poultry Ranch, Campbell, Cal.

STIRLING FARM—Place your order now for eggs and chicks from Stirling Layers. Utility Leghorns exclusively. Our pure-bred tested layers are bred for size, vigor, quality and heavy-egg production. Send for descriptive circular and prices. Route 2, Box 1416, Sacramento, Cal.

MACFARLANE STRAIN WHITE LEGHORN eggs, $1.50 per 15, $2.50 per 20, $5.00 per 100; chicks Dec., Jan., Feb., 12c each, afterward 10c. Order now, any quantity. Cockerels, $2.50. Big plant, low prices, stock better than ever. Catalogue free, correspondence solicited. Newton Poultry Farm, Dept. 1, Los Gatos, Cal.

MAKE BIG MONEY with our White Orpingtons. Best breed for every need. Lay most when prices highest; make finest eating; return greatest profit. 1000 grand range-raised birds, trap-nested and bred for heavy laying. Eggs, chicks, stock. Prices reasonable. Catalog free. Whitten Ranch, R. D. 5, Box 647, Los Angeles.

WHITE PLUMAGE POULTRY FARM and Hatchery. Sells day-old chicks from healthy, vigorous breeders. White Leghorns at $10 per 100, $90 per 1000. Barred Rocks and Rhode Island Reds at $15 per 100. We sell the Victor Incubator and Brooder. Circulars free. H. A. Schlotthauer, Exeter, Cal.

BARRED PLYMOUTH ROCKS—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for Catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 398, Los Gatos, Cal.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs, Baby Chicks and 10 weeks' old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired **Heavy Winter Layers.** W. C. Smith, Prop., Corning Cal.

PENN'S QUALITY BARRED PLYMOUTH ROCKS—At the World's Poultry Exhibition, San Francisco, our **Western Bred** Rocks ranked among the best in the world, both in untility and exhibition points. Catalogue free. Breeding stock and eggs for sale. Golden Rule Poultry Farm, St. Helena, Cal.

WE LEAD IN CAPACITY—THE SANTA CLARA VALLEY HATCHERY AND POULTRY RANCH—We can serve you with the best the Valley can afford; 8 varieties of baby chicks. White leghorns in 1000 lots a specialty. Your correspondence solicited. Information cheerfully given. Route 6, Box 336C, San Jose, Cal.

ALL KINDS OF BREEDING and laying hens, roosters and pullets. Petaluma incubators, new and used. Baby chicks of Brahmas, Orpingtons, Anconas, White and Barred Rocks, Rhode Island Reds, Black Minorcas, Buff White and Brown Leghorns. Best quality. Prices reasonable. Immediate deliveries. Brown's Poultry Yards, 2550 San Pablo Ave., Oakland, Cal. **Closed Sundays.**

ROOFDEN CHICKS are hatching every week. When do you want yours? White Leghorns that are worth while, by hundred or thousand. Black Minorcas, beauties, great layers of big eggs, and a hardy strain. Rhode Island Reds, the breed for meat and winter eggs. We can supply you with prices that are **right.** Ask us. Circular free. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

BUFF ORPINGTONS, BUFF LEGHORNS, BOURBON RED TURKEYS, BUFF DUCKS—Winners at Riverside, Pasadena, Los Angeles and San Francisco. Breeding stock. Hatching eggs. Baby stock. Free illustrated booklet. The Ferris Ranch, R. 2, 144D, Pomona, Cal.

HERE IS YOUR CHANCE to get thoroughbred White Leghorn hens Hoganized heavy-laying strain. $18 per dozen. Cocks, $3. No culls. Correspondence solicited. Stoldt Poultry Ranch, R. 6, Box 258, San Jose, Cal.

BABY CHICKS — White Leghorns, Black Minorcas. We guarantee safe arrival and full count. Strong, vigorous chicks. 1916 catalogue contains instructions on care of baby chicks. Free Lasher's Hatchery, Petaluma, Cal.

BROWN LEGHORN, WHITE LEGHORN day-old chicks that are well-hatched and strong, from healthy vigorous breeders. SAN JOSE HATCHERY, 373 Meridian Road San Jose, Cal. "Chicks well hatched are half-raised."

INCUBATORS AT MANUFACTURERS' PRICES—To assist the poultry industry, we are making this concession. Write the GEO. H. CROLEY CO., INC., 631-637 Brannan St., San Francisco, for particulars.

WHITE ROCK BABY CHICKS from good winter layers. Booking orders now. Early hatched chicks make early Fall layers. Few Hoganized cocks for sale. Mrs. J. B. Tupper, Ceres, Cal.

WHITE LEGHORN BABIES and Hatching Eggs from Hoganized heavy-laying strain. Correspondence solicited The O. C. McDonald Poultry Ranch, King and Jefferson, San Jose, Cal.

BARRED ROCK COCKERELS—$2.50 each. Am booking orders for Rhode Island Red and Barred Rock chicks for February, 15c each. G. L. Hawley, Madera Cal.

PERFECTION FIRELESS BROODERS—There is none better. Simple, inexpensive, easy to operate. Free trial. Ask for particulars. H. E. Teal, Willits, Cal.

BABY CHICKS AND EGGS—Hoganized Black Minorca, White Leghorn stock specialties. Free instructions on raising chicks. Hicks Jubilee Hatchery, Petaluma.

WHITE LEGHORNS—Hoganized. Bred to lay. Booking orders now for hatching eggs. $6 per 100, $50 per 1000. No chix. R. H. Dickinson, Los Gatos, Cal.

BABY CHICKS—Eastman's bred-to-lay Barred Plymouth Rocks from Hoganized and trap-nested stock Fairmead Poultry Farm, Fairmead, Cal.

WHITE ORPINGTONS—200 egg strain and Buttercups, the new farmer's fowl. Write for prices and description. M. S. Woodhams, San Mateo.

ORPINGTONS: BUFF AND WHITE—Black Minorcas and Carneaux pigeons. Cockerels ready for service. Susan Swaysgood, R. 2, Pomona, Cal.

WHITE LEGHORN BABY CHICKS that are hatched right, from good stock. Order now for spring delivery. Mrs. G. Logan, Morgan Hill, Cal.

HATCHING EGGS from Hoganized S. C. W. Leghorn two-year-old hens, $1 per setting, $5 per 100. Allendorf Egg Ranch, Kerman, Cal.

EAST SACRAMENTO HATCHERY—Capacity 16,000. Special low price for large lots of chicks. Box 1205 M St. Road, Sacramento, Cal.

S. C. RHODE ISLAND REDS—Bred to lay. Hatching eggs and baby chicks. Cocks and cockerels. B. C Quessenberry, R. 4, Lodi, Cal

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

RHODE ISLAND RED BABY CHICKS and Eggs. Heavy laying strain. Send for circular. Rosedale Ranch, R. 1, Hayward, Cal.

TRAP-NESTED LEGHORNS—Eggs and chicks. Heavy layers. Write for catalogue W. G. Suits, 378 Bandini Ave., Riverside, Cal.

BLACK MINORCA, R. I. Red, Buff Orpington Cockerels. Eggs for hatching. Mrs. R. A. Holdridge, P. O Box 282, Dixon, Cal.

TRAPNESTED LEGHORNS—White and Buff Stock. Eggs, chickens. Arthur E. Schroeder, Box 179E, Mountain View, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, PEA FOWL. Address Wm. A. French, 545 W. Park St., Stockton, Cal.

S. C. RHODE ISLAND REDS—Hatching eggs, Baby chicks and cockerels. Mrs. V. P. Hewitt, Dixon, Cal.

SINGLE COMB Rhode Island Reds. Eggs and stock for sale. Dirk Dairy Farm, Lemoore, Cal.

BLACK MINORCAS—Cockerels. Reasonble. Chester Fosgate, Quito Road, Campbell, Cal.

HARES AND RABBITS.

LEADING RABBITRY IN AMERICA—Flemish Giants and New Zealands. Cut your living expenses. Catalogue free. Empire Rabbitry, Empire, Cal.

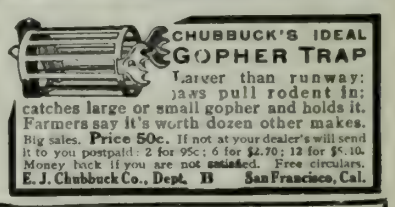
BELGIAN HARES—Young stock for sale. Hurd Bros. St. Helena, Cal.

TURKEYS, DUCKS AND GEESE.

TURKEYS—Bourbon Red, White Holland, Mammoth Black. Pens headed by 1st prize winners at World's Fair, San Francisco, 1915. Young males, $8 and $10. Old males, $12 and $15. Young hens, $3.50 and $4. Old hens, $5 and $6. Choice sturdy stock. Eggs, $5 per dozen. Mrs. B. Hocking, Guasti, Cal.

BOURBON RED TURKEYS and eggs for hatching. My birds won all the honors in the Alameda County Poultry Exhibition in Oakland, 1914. Just as fine this year. A. E. Balmer, Alhambra Valley, Martinez, Cal.

MAMMOTH BRONZE TURKEYS—THE BEST IN THE WEST—Extra special prices. Further information cheerfully given. Write now to secure best birds. Geo. A. Smith, Corcoran, Cal.



HART'S BRONZE TURKEYS—Vigorous young stock. Also large yearling hens, $5 each. Eggs in season. Circulars free. Albert M. Hart, Clements, Cal.

ROCKWOOD FARM WHITE HOLLANDS are selling rapidly. Let us quote you stock. 201, R. 6, Santa Rosa, Cal.

THOROUGHBREDS—White Holland Turkeys, White African Guineas for breeding. T. M. Calvert, McFarland, Cal.

HOPLAND STOCK FARM

POULTRY DEPARTMENT, HOPLAND, CALIF.

Best Equipped Poultry Farm in California.. Sanitary conditions perfect.

RUNNING THE INCUBATOR.

If your incubator is in a good cool cellar or building with plenty of fresh air the conditions are right for your work. If, on the other hand, you are attempting to run an incubator in a bedroom, a kitchen, or in any place where the temperature varies ten to as much as thirty degrees, don't expect to get a big hatch of strong chicks. I admit you may do it, but the chances are bigger that you won't. I know it because I have been all through that part of the game. There is nothing in it; build a small cellar or a separate place.

How to Start.—Never start your hatch with a dirty burner or an old wick. After things are ready start your lamp and run the incubator until it reaches 103, or whatever degree you wish to start at, then regulate it and keep at it until you get it so that it stays at 103 without losing or gaining. Not until it has run thus several hours is it safe to put the eggs in. In placing eggs on a tray, there is always the desire to put just a few more on each tray, and that extra few cause more losses than they ever do good. It is as bad, in a way, as crowding chicks in a brooder. If you have more eggs than the machine will hold, hire a couple of good hens to set on them until you can test the machine out, then you will have room for them. Place the eggs in a slanting position, never on end; the germ does not lie at the end of the egg but midway between, a little nearer the large end than the small one. When the egg sets slant-wise the heat can strike the germ of each egg, but if placed on end in order to crowd a few more eggs on a tray, the heat rays cannot do what they should do and you take the eggs out later as having started, but not grown. There is your loss for crowding.

It is better to put eggs in early in the day, and then watch the machine until the thermometer gets to the degree you set it at. Don't be in a rush to change it, unless it tries to run too high. In case it does, work patiently until you have it adjusted. The life of the hatch often hangs on the first five days; eggs will stand more abuse after that time than before. Be sure everything is right before you leave it and then it will in all probability stay right, if you burn good oil.

Testing the Eggs.—The first and second day just attend to your lamp; don't open the door until the third day, then move the trays into different positions and turn the eggs. Then if you are an old hand you can test out white eggs and make room in the trays. Have your room fairly warm, or cover the eggs so that they won't chill and work fast, one tray at a time, getting the eggs in already turned as quick as possible. If the eggs feel cold to the touch put them back without testing all, but turn them, as they must not stay in one position any longer. If you are not an expert better leave the testing until the fifth or seventh day.

On the third and fourth day you will notice a small black spot with blood streaks running from it, but it is so small that you will not be able to tell whether it is a growing germ or a dead one unless you have tested a great many eggs. Of course anybody can tell the clear eggs that can see, and those can all be taken out. With dark colored eggs it is not safe to test at all under five days, and seven is safer. Dark eggs are very deceitful, and no matter how many you have tested unless you have a very strong light you are liable to take good fertile eggs out: eggs that would mean chicks.

After ten days test again and if there should be a bad egg escape you, you will certainly smell it on opening the incubator door. Once you smell it, find it if it takes an hour.

After the fifth day turn the eggs twice a day and if weather is cold that will be all the airing they need until the tenth day when you can leave them until they feel cool to the touch. Also at every turning or taking out roll the eggs a little, being careful not to break them. Rolling eggs is exercise for the chicks and makes them stronger, and is also an aid towards preventing cripples.

If you notice, the last chicks to hatch are the cripples, very rarely any that hatch early are so deformed; and the reason for this is that the shell, or rather chick, has been laid in that one position so long that the limbs are deformed. Rolling helps them to hatch quicker. The moisture question is usually given consideration by the man that sends out the machine and I always think he knows more about that particular machine than anybody else, so if you have lost the directions and are at a loss to know what to do, don't ask anybody, but just write the maker, tell him your troubles, and he will set you right if anybody can.

After Hatching.—It is not good policy to open the incubator until the hatch is off, though it is done many times with no seeming ill results, but for the amateur it is wise to keep the door closed until near the end or he may chill eggs that would hatch good strong chicks. As soon as all are hatched that are going to hatch, open up the doors and take out the shells and trays, give the chicks some fresh air and leave them right in the nursery for 36 hours. Adjust the air and heat by the contentment of the chicks. You will notice if they are too cool they will huddle together, and if too warm they will gape for breath. These things are wrong, but I am telling you so you will know what is the trouble if they occur. A contented chick sits down and "cheep cheeps" quietly and lazily or stands wondering why he is kept in that box when he wants to run.

California Poultry Practice

WRITTEN TO TEACH BETTER POULTRY METHODS ON THE FARM.
By Mrs. Susan Swaysgood.

Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

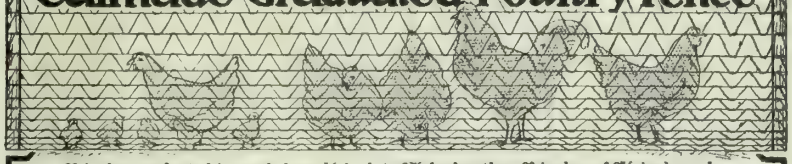
"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.

"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."



The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Price, cloth-bound, postpaid, $1.00.

Pacific Rural Press, Publishers

525 Market Street, San Francisco, Cal.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1⅞ inches then 20 inches of 2¾ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

MRS. BEST'S BULLETIN.

My dear Friends:

Amid this season of "Sales" I am sure that some startling new wares are being unpacked in the basements and lofts. Some few are already finding their way to view as the post-holidays bargain pursuers clear off the counters.

Somehow I am afraid that the fine leather garments now in the height of their smartness in New York are "catching on" rather slowly here. The progressiveness of our smart dressers is hardly to be considered at fault, however; rather it is a result of climatic conditions. The impressive leather redingotes, jerkins, waistcoats and cap collars—to say nothing of turbans, which are more in evidence here on the coast than costumes in leather—may be very chic and snug where zero blasts toy with the ladies. But here they might be a little beyond comfortable except in an open automobile. But they are the rage in the East in all shades of color and in many kinds of finish from the glaze of patent leather to the velvety suede.

More in favor are the knit sport coats in this modified climate. The outfit generally includes a toque and scarf of the same material and shade. One very snappy outfit was in pink thread silk with the wide belt and a generous knot in front, embellished with appliqued bands of vivid green tartan plaid on the collar, cuffs and pockets, and on the toque and ends of the scarf. Such scarfs are usually priced at $10 with the other goods in proportion.

Saw a regal jet bead overdress for evening wear at $27.50, fit to wear at a court function.

In hats I saw a small black velvet shape with closely curled brim that was made bewitching with one black medium-sized plume flowing rakishly back from the front where it was fastened with a large plain silver buckle.

Something to interest Small Son—a baseball uniform set at $1.10. It includes a 2-piece striped cotton uniform, cap, belt and socks.

As a help to the amateur in photography there is an exposure meter device for fastening to the shutter with data for exposures suitable to the various times and diaphragm openings.

For a mantel knick-knack there is an alabaster model of the Coliseum at Rome, for $1.

The woman's mackinaw coat has arrived. It is like the men's except that it is cut very, very full and skirts quite long and ample.

And I think this chat has been quite long and ample and I will forbear, With kindest of regards,

ROSABELLA BEST.

(Note—Readers wishing information from Mrs. Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

THIS WEEK'S BEST HOUSEHOLD HELP:

To clean painted woodwork—simply moisten a rag with coal oil (kerosene) and rub the surface to be cleaned.

Often Enough.—"Pa, what is repartee?" "Oh, merely an insult with its dress-suit on, my son."—Puck.

A COMFORT OF HOME IS THE COMPANY SHELF.

"We have never found Mrs. S—— unprepared," say all her friends, of a woman noted for her ready hospitality. But their admiration is of second consideration. Since her foresight in having what she calls her "company shelf" has saved her from embarrassment and flurry on many an occasion, to her own satisfaction. On this shelf she keeps practically untouched, except on emergencies, a supply of those eatables that may be quickly served. Once begun, this shelf is maintained with little expense, well stocked with ammunition against surprise. Here is a list of suggestons for this shelf, which is considered apart from the regular larder.

1 doz. box sardines.
½ doz. cans baked beans (large size)
½ doz. cans salmon.
3 cans tunny.
3 cans chipped beef.
6 cans deviled ham.
3 cans herring.
Olives
1 jar cheese.
1 bottle salad dressing.
1 pkg. seeded raisins.
6 cans soups.
1 large can corned beef
Bouilion cubes.
3 packages egg noodles.
6 pkg. macaroni & vermicelli.
1 doz. pkg. crackers & cookies.
Bottled grape juice.
Jellies and jams.
3 cans oysters.
3 cans tamales.
Canned corn, tomatoes, peas.
1 can tomato sauce.
1 pkg. rice.
1 pkg. minute tapioca.
Pickles (mustard, sweet, sour and dill).
Bottled pineapple juice.

With a supply like this, one can start an indoor or outdoor picnic any time. But the main idea is to keep it replenished.

THE IDEA EXCHANGE.

Who knows the best recipe for a "Mulligan"? This popular stew is demanded by the brawny menfolks at the ranch of Mrs. K. D. V., Sonoma county.

We have it from a reader at Santa Ana that potassium permanganate at the rate of a teaspoonful of the crystals to a gallon of water will prolong the freshness of cut flowers standing in it.

Thanks to Amelia R. of Yuba City for her appreciation of the plum pudding suggested in the Dec. 25 issue.

If the correspondent signing herself "Sycamore," Fresno, will provide her name and full address the formula she desires will be mailed to her.

COMMUNITY PROPERTY.

Something that no doubt will command the attention of women all over the state—married women above all—is the agitation just begun through the California Federation of Women's Clubs for amendments to the constitution affecting property rights of the sex. A recent conspicuous domestic disturbance provoked the agitation, which will be put before the legislature on its general merits. The reforms aimed at are: First, to relieve the wife of paying inheritance tax on the community property; Second, to treat the husband and wife alike in inheriting the whole of the community property without formality, except for the usual rights of the children in the deceased partner's half; and Third, to make it obligatory that all community real estate stand in the name of husband and wife.

HERE'S A SAVORY DISH.

Are you preparing a meal with macaroni? You need not cook a meat dish separately.

Have your macaroni in the pan and start it baking. Then twenty minutes before it should be done lay small pork sausages on top of the dish and let them bake with it, turning them once so that they brown on both sides. The flavor of the sausages will permeate the entire dish of macaroni. And the tempting sight and the aroma of it as it reaches the table will make all hitch their chairs closer.

HAVE YOU TRIED:

Putting in a bit of salt when cooking very sour fruits to need less sugar?

Using a scrap of waxed paper instead of beeswax on ironing day?

Washing the cook stove with clean soapsuds as a substitute for polish?

Using a teaspoonful of vinegar in the lard while frying doughnuts to keep them from soaking it up?

Sprinkling a pinch of flour over eggs when frying to prevent grease popping?

SATISFACTORY SWEET MUFFINS.

(This Week's Preferred Recipe.)

A quick and most satisfying formula for muffins is the following: Mix and sift 1 cup sugar, 3 cups flour, 2 teasp. baking powder and 1 teasp. salt; add 1 pint sweet milk, 1 beaten egg, 1 tablsp. melted butter, and 1 teasp. vanilla extract. Beat vigorously and bake in greased muffin pans. This recipe will make 18 delicious muffins.

YOUNG PEOPLE'S FILMS.

All over the country the subject of motion pictures is receiving renewed attention. The fact is that children under a mature age are absolutely not catered to by producers, and therefore they have to see pictures that in many cases they do not understand or appreciate, or that may be positively harmful to them.

It is a question that is hard to solve. In the first place a picture perfectly satisfying to a young child is the most baffling thing to undertake imaginable; in the second case the manufacturers find it commercially advisable to cater directly to the more mature spectators. This is the case even where they are in sympathy with the complaints that reach them about lack of adaptability of the film subjects to the infant mind.

In an effort to assist grown people to select such a program of films as will not be objectionable for children, the National Board of Censorship issues a periodical list of films it has reviewed which it thinks can do no harm to children under 16. Such a list of titles is given herewith as a sample, this being the latest issued, and some of the films are probably on the market yet.

Brown's Summer Boarders, Getting Rid of Aunt Kate, The Ranch Girl and the Cowboy, Lake Louise, Canadian Rockies, Dreamy Dud in the Old Swimming Hole, Sonny Jim and the Great American Game, A Prince in Disguise, In the Palace of the King, The Honeymoon Pact, In Double Harness, The Barnyard Mixup, When the Light Came In, The Wizard of the Animals, Captain Kent's Educated Seals.

A Two-Cent Mystery, The Kid Magicians, The Hired Girl, Whiffle's Busted Alibi, An Intimate Study of Birds No. 1, One Reel Feature, Dreamy Dud in King Koo Koo's Kingdom, Grand Canyon, Old Good-for-Nothing, The King of the Air, Dreamy Dud Goes Deer Hunting, In the Mountains of Jutland, A Slavey Student, The Quest, Twice Won, Mr. Paganini.

Dreamy Dud: A Visit to His Uncle Dudley's Farm, Willie Stayed Single, The Ring-Tailed Rhinoceros, Mr. Jarr and the Visiting Fireman, The Elephant Who Worked for a Living, A Ten-Cent Adventure, The Fox Woman, Tracked Thru the Snow, His Two Patients, The Fairy Prince.

Of course it is impossible for the board to guarantee that the children will vastly like a program made up from this list. Some of the titles are not very promising for a hilarious shout of glee from the little ones. For instance Lake Louise, Canadian Rockies, would not send them rolling off their chairs in enjoyment, though it is doubtless very improving.

In the writer's opinion it is a mistake to ram all the educational films down the throats of the small children, while the grown-ups dodge them and select something with a thud and smash in it. However, several minds are now seeking to devise lively dramatic and comedy films particularly intended for children. It is to be hoped something comes of it.

HIS ONE TUNE.

Pietro is old and is bent and is grey,
A worn barrel organ he turns all the day,
And one tune you hear every time you pass by,
That old childhood favorite, sweet "Rockaby."

"Rockaby baby, on the treetop"—
Into his cap the pennies now drop,
"When the bough breaks the cradle will fall—"
What tender visions those old notes recall.

Men who are busy with weighty affairs
Pause for a moment forgetting their cares,
Memory quickly goes back to the day
Their own mother sang it her own loving way.

"Rockaby baby, mother is here—"
Surely she is; you can see her face dear,
"Angels of slumber, hovering nigh—"
Pietro, there's gold in your old lullaby.

Pietro's one tune echoes on year to year;
Poverty's gnawing he never need fear,
Rivals may come with their ragtime more spry,
But Pietro will win with his sweet lullaby.

"Rockaby baby"—memory's wings
Take the man back as his money he flings,
"Rockaby baby—" evening draws nigh—
O, Pietro, once more with your old lullaby.

—By J. E. Sanford.

AN AID TO THE SHY.

"As I think back," said Aunt Martha, "I wonder how we can ever get along without the phonograph."

"We would talk for a time to the shy young man caller about the weather, and then we would discuss the coming church picnic and hope that we would have good weather for that, but that about used up our topics of conversation.

"It helped a little for me to play two or three pieces on our good, old square piano, but when I swung around on the piano stool — there were not so many piano benches then—we would come to another silent spell; and then pretty soon the shy young man would say:

" 'Well, I guess I'll have to be going now.'

"But now," went on Aunt Martha, "why, now when the conversation lags you have the phonograph.

" 'Oh, have you heard this?' you say to the shy young gentleman, and then you put on the disk and crank the machine.

"From that on there is no trouble. In the course of time, when the young man rises to go, you hear not, 'Well, I'll have to be going now,' but this: 'My! I didn't know it was so late;' spoken with animation. He has had a pleasant evening.

"Really, it seems to me that to shy young people the phonograph is nothing less than a blessing. I don't know how we ever got along without it."—N. Y. Sun.

Ruth's Reply.—Ruth went to call on her little friend Mary. She was met at the door by Mary's mother, who told her that Mary had had the mumps and she must not come in, for then she would be exposed, and she, too, would have the mumps. Ruth reflected for a moment, then said: "O, I can come in, for I'm sure I won't take them, for I was exposed to a very bad case of broken leg last week and I didn't take it."

FIRST BASEBALL MITT.

About 1867-68, a baseball team came to Rockford, Illinois, writes an "old timer" in All Outdoors, to play our nine. They called themselves the "Unconquered Clippers of Illinois," and plastered our town with big posters. We made up our minds to give them a drubbing, and at the end of the game the score was, Rockford 76, Clippers 0.

There was a little chap playing third base who grabbed everything that came near him, and held it, too. I noticed that he wore a kind of glove. When the game was over, I went to him and asked what it was that he wore on his hand. He told me that he was a machinist, and had got his hand badly hurt a week before, and he showed me the wound in his palm. He said the boys did not want him to play in that game, but he got a piece of thin sheet steel and made it slightly concave, but so that it did not quite touch the sore place. He then made a short glove to cover all the hand excepting the first joints of the fingers, and doubled the leather in the palm so that he could slip the plate between.

I asked him if it hurt, and he said it did not, and that he could take a hot one and hold it better with the glove than without it. That is the whole story. I don't think that Spalding ever talked to the little chap with the iron fist, as the boys dubbed the third baseman, but everybody in Rockford knew about the mitt; and he may have got the idea from him. Anyway, that was the first glove that any ball player ever wore.

IT SOUNDS MODERN.

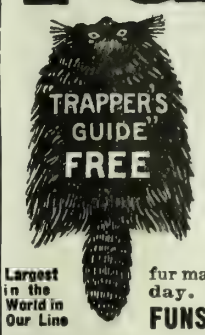
Overalls for women are becoming the fashion among Georgia housewives, says a story from Savannah, Ga. The demand for these useful garments has become so great that storekeepers are laying in supplies of them in boys' sizes and cut especially to fit the female figure.

"Overalls are the ideal dress for housework," says Mrs. E. W. Davidson, who uses them and makes no secret about it. "The unconventionality of the garb should not count, because women are not supposed to be on exhibition when housecleaning.

"If you wear a nice dress you soil it, and if it isn't a nice dress you don't look well in it. I find that undoubtedly the proper dress for cleaning windows and sweeping floors and the like are overalls. They can be neat and white, and they don't need to be unlovely.

"Did you ever set out hotfoot after old Mr. Dust in a dress, and, while you were chasing him, seem adorable, and at the same time eliminate the dust instead of transferring it to your own garments?"

Took the Only Thing Left.—"Did the trained nurse take your temperature?" asked the man of his convalescent friend. "Yes," responded the sick man. "After the surgeons got through with their charges, that was about all there was left to take."



Hopeful. — Traveler — Isn't this train pretty late? Station Master—Yes, she is a bit behind, mister, but we're expectin' her every hour, now. —Harper's Magazine.

Only One.—Victim of Accident—Did you notice the number of that machine that hit me? Si Botts—Sure. Victim—What was the number? Si Botts—One; how many did you think it was?

Good Advice. — Arthur — About how much salary should a chap get before marrying?

The Bookkeeper—Oh, just a bit more than he ever will.—Chicago News.

FUNSTEN BROS. & CO., 393 Funsten Bldg., St. Louis, Mo.

The Markets.

Unless otherwise noted, prices quoted are f. o. b. San Francisco.

San Francisco, Jan. 12, 1916.

WHEAT.

Buyers are taking a little more interest, and there is said to be a little more movement in the country, though growers are generally holding for an advance. Values show no quotable change.

Cal. Club, ctl.	$1.70 @ 1.72½
Northern Bluestem.	1.80 @ 1.82½
Northern Club	1.72½ @ 1.75
Northern Red	1.65 @ 1.80

BARLEY.

The market has stiffened up a little in the last week, as buyers are again coming into the market, and both grades are moving at an advance. Most offerings, however, are firmly held.

Shipping, ctl.	$1.35 @ 1.37½
Choice Feed, ctl.	1.30 @ 1.35

OATS.

There is no heavy demand here, the movement being mostly of a jobbing nature. Northern holders, however, report a demand from the East, which may develop into a large movement. White oats are a little higher.

Red Feed	$1.30 @ 1.35
Red Seed	1.45 @ 1.65
White	1.40 @ 1.45

CORN.

Yellow continues to stiffen up in the East, resulting in a further slight advance here, and desirable lots of California corn bring about the same figure. The sorghum grains are unchanged, but continue in very good demand.

Eastern yellow, ctl.	$1.75 @ 1.80
Milo Maize	1.40 @ 1.45
Kaffir	1.65 @ 1.70
Egyptian	1.45 @ 1.55

BEANS.

The first decline noted in several months has occurred on cranberry beans, which are 20c lower. Large whites and pinks have again been marked up a little, other lines standing as before. A few shipping orders have come in since the first of the year, but the demand so far is nothing like what it was a month ago. Stocks, however, are light in most lines, and with a much greater demand expected in the spring the market is firm.

(On wharf, San Francisco.)

Bayos, per ctl.	$5.00 @ 5.10
Blackeyes	3.50 @ 3.60
Cranberry Beans	4.90 @ 5.00
Horse Beans	3.25 @ 3.50
Small Whites (south)	5.80 @ 5.90
Large Whites	5.75 @ 5.90
Pinks	4.30 @ 4.40
Limas (south)	4.60 @ 4.70
Red Kidney	6.50 @ 6.75
Mexican Reds	4.50 @ 4.65

SEEDS.

The varieties quoted receive only slight attention at present, as most of the planting has been done. The seed market in general, however, is quite active. Values show little change.

Alfalfa, per lb.	18 @ 19 c
Melilotus Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

Current arrivals have been very light, in fact rather below current market requirements, owing to unfavorable weather. While the demand here has been light, all offerings have moved readily, and prices have averaged a little better than before. With more favorable weather, a heavy movement is expected, as many buyers who have been holding off are now disposed to put in stock to last till spring. Whether this will stiffen up the market is uncertain, as the favorable crop outlook will no doubt bring in a lot of hay that has been held back.

No. 1 Wheat	$12.00 @ 15.00
No. 2	10.00 @ 11.50
Tame Oats	10.00 @ 16.50
Wild Oats	8.00 @ 11.50
Alfalfa	10.00 @ 14.00
Stock Hay	6.00 @ 9.00
Straw, per bale	.25 @ .40

FEEDSTUFFS.

The feed business in general is keeping in good shape, and alfalfa meal has been marked up again. Cracked corn also is higher in sympathy with the advance in corn, and rolled barley is firmer.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$21.00 @ 22.00
Alfalfa Meal, per ton.	19.00 @ 21.00
Alfalfa Molasses Meal per ton	21.00 @ 22.00
Bran, per ton	25.00 @ 26.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @ 25.00
Cracked Corn	39.00 @ 40.00
Middlings	32.00 @ 33.00
Rolled Barley	26.50 @ 27.50
Rolled Oats	29.50 @ 31.00

VEGETABLES.

The effects of the frost have been apparent for the last week, lettuce, celery, cauliflower and artichokes especially being hard hit, though southern vegetables did not suffer. Arrivals were very light for a few days, but have been much heavier this week, consisting largely of damaged stock. This has caused very easy prices on ordinary offerings, though desirable lots in practically all lines are firmly held. Lettuce especially is in heavy supply. Rhubarb is coming a little more freely, and is easy but not quotably lower.

Cabbage, ctl.	35 @ 50 c
Cauliflower, doz.	35 @ 75 c
Sprouts, lb.	3 @ 4 c
Rhubarb, box	$1.00 @ 1.25
Peas, southern, lb.	.08 @ .10
String Beans,	.08 @ .12
Lima Beans	.08 @ .10
Peppers, bell, lb	.05 @ .08
Tomatoes, L. A., crate	.50 @ 1.00
Eggplant, lb.	.05 @ .07
Celery, crate	2.25 @ 2.50
Artichokes, doz.	.50 @ 1.00
Lettuce, small, crate	.75 @ 1.25

POTATOES AND ONIONS.

Potatoes and onions of all kinds are higher, as the California stock is cleaning up, and the market is drawing rather heavily on outside markets. Delta onions are cleaned up along the river, with only a few cars in storage, and Oregon stock is up to $2.

(On Wharf.)

Oregon Burbanks	$1.60 @ 1.85
Salinas Burbanks	1.90 @ 2.00
Delta Burbanks	1.25 @ 1.60
Sweet Potatoes, ctl.	1.30 @ 1.75
Onions, Delta, ctl	1.60 @ 1.75
Oregon	1.50 @ 2.00
Garlic, per lb.	10 @ 12½c

POULTRY.

The turkey market is irregular, short arrivals some days sending prices up, while a slight increase of shipments causes a drop; but the quoted figures cover the average range. Chickens, etc., show no change for the week, but the market is firmer in tone, as the demand has picked up appreciably and arrivals of most lines are moderate.

Turkeys, dressed	24 @ 30c
Live Turkeys, old, lb.	19 @ 20c
do, young	20 @ 21c
Broilers, 15 lbs. to doz. and less, lb	30c
do, over 15 lbs. to doz.	23 @ 25c
Fryers	21 @ 22c
Hens, extra, per lb.	16 @ 17c
Small	15 @ 16c
Smooth Young Roosters, per lb.	17 @ 19c
Squabs, per doz.	2.00 @ 4.00
Geese, per pair	2.25 @ 3.00
Ducks, young, lb	18 @ 19c
Old	14 @ 15c
Belgian Hares	9 @ 11c

BUTTER.

Creamery men are greatly interested in the amended law which took effect Jan. 1., requiring that butter bearing a geographical name shall be marked with the place of origin. Extra grade is rather scarce, and prices are a little higher than last week, being also above the level of last year. There has been a sharp advance in the north, and liberal shipments are going that way, consisting largely of storage stock. The outlook is considered favorable for increased shipments to Australia this year.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26½	26	27½	28	28	27½
Prime Firsts	25½	25	25	26	26	26
Firsts	25	24½	24½	24½	24½	24½

EGGS.

Extras have dropped 3c. during the week, and pullets also are slightly lower, as production continues to increase and the local demand is nothing extra.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	32	31	30	30	29½	29½
Sel. Pullets	29½	29½	28	28	28	28½

CHEESE.

There is little new in the cheese market, fancy flats being slightly higher on light receipts, while other lines are steady at the former figures.

Y. A.'s, fancy	17 c
Fancy Calif. flats, per lb	15½c
Monterey Cheese	16@17c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	28	28	28	28	28	28
Eggs	33	32	30	30	30	30

DECIDUOUS FRUITS.

Apples constitute practically the only offering in this line at present, and they are now all coming from cold storage. The local demand for the last week has been very light, and while there has been some inquiry for shipment, business is not very active. Oregon stock receives more attention than local.

Apples, Cal. Newtown	$ .75 @ 1.25
Pearmain	.65 @ 1.00
Greening	.65 @ 1.00
Baldwin	.75 @ 1.25
Oregon Spitzenbergs	1.50 @ 2.50
Jonathan	1.20 @ 1.75

DRIED FRUITS.

The market locally is very uninteresting. The only quotable change is on prunes, on which the range has narrowed down considerably, with 5½c. as the top figure, and rather extreme at that. In fact, nobody wants prunes very urgently at present, and anyone anxious to sell might have to offer special inducements. The quantity on hand, however, is not heavy, and holders generally are confident that the market will stiffen up as the season advances, so there is not enough pressure on the market to cause any distinct weakness. In other lines packers say there is nothing doing, mainly because there is practically nothing left in the state, aside from small and widely scattered lots. These, if of desirable quality and offered when there happens to be demand, should bring good prices: otherwise it is hard to tell what they will bring. Just now the trade is not taking much interest in anything, and offerings will probably be better received in another month. Raisins at present are quiet, but steady, the movement up to the holidays having been very satisfactory. The Associated Company announces its intention to pay a ¼c advance for sultanas for the next two years. The New York Journal of Commerce says:

Though very little material change is apparent in the New York market for prunes, Coast advices state that the general tendency among packers is somewhat firmer, and that prices appeared to be slowly moving toward a higher level. With stocks of California figs growing very scarce on the Coast, operators report that the market is very quiet and that only a moderate buying is in progress in any quarter. Coast apricots, though quiet are maintained on a very strong basis. Peaches for future shipment from the Coast are steady, with no change in the general range of prices.

Apples	6½ @ 7½c
Apricots, per lb.	9 @ 12 c
Figs, white	5 @ 6 c
Black	3½c
Calimyrna	8 @ 10 c
Prunes, 4-size basis	5 @ 5½c
Peaches	4½ @ 6 c
Pears	4 @ 7 c

CITRUS FRUITS.

The eastern citrus auctions show a little higher prices for navels than before. The lemon market is in good shape and prices well maintained. Tulare county has practically closed its most successful orange season, the average being about $1.90 per box paid to the growers.

At New York on Monday, Jan. 10th., the auctions averaged for navels from $1.85 to $3.65 per box; for lemons $3.20 to $4.20. At Chicago the same day, prices averaged for navels from $2 to $3.25, and lemons $375 to $4.25 per box.

Grapefruit has found little demand for the last couple of weeks, and with accumulating supplies prices have been marked down sharply. A little better movement has resulted. Oranges and lemons are doing a little better the last day or two, but have been quiet most of the week.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50 @ 2.75
Tangerines	1.25 @ 1.75
Grapefruit	1.75 @ 2.50
Lemons, box	1.50 @ 3.75
Lemonettes, box	1.25 @ 1.75

HONEY.

The local demand for honey has not revived to any extent, sales being almost entirely in very small lots, though there is an occasional lot shipped to other markets. There is enough of most grades on hand for all requirements, though fancy comb honey is rather scarce.

Water White, comb	13 @ 15 c
Amber	8 @ 12 c
Water White, extracted	7 @ 8 c
Light Amber	3 @ 4 c
Dark	2 @ 2½c

NUTS.

The general demand is naturally light at this season, though any desirable lots of walnuts would find a fair market, owing to the scarcity. There is still a fair supply of almonds, but the crop is expected to

Special Live Stock Market Report.

The strong tone of hog and mutton markets all over the country has been an influencing factor in bracing up the local market and as a result several classifications have been marked up. As an evidence of the strength of the hog situation, Chicago receipts broke all previous records on Monday with a run of 85,000 head, the market only breaking 18 cents, which was entirely recovered the day following. Light hog arrivals are still fairly free here, but supplies are getting pretty well cleaned up in the country on all lines and it now appears certain that feeders who were generous with grain and kept their hogs will realize satisfactory results.

The mutton market is improving and while the larger packers are drawing on their feed lot supplies to meet requirements, others are compelled to go to Utah and Idaho and it looks as though this condition will continue for some time.

The fresh meat market here is recovering from the effects of the Christmas glut and is expected to get back to normal by next week. At the present time trade in cattle is slow, owing to the above condition, but the apparent seriousness of the hay situation is responsible for heavy offerings from the country, which are not, however, meeting with any response from the buyers. This condition is expected to improve some as soon as the dressed meat market gets right again. Both the Portland and Seattle quotations on cattle are higher than the local buyers will offer.

WOOL.

A wire from Boston today says: "Boston market is extremely active on fine wools and medium grades are strengthening. Now looks as though we might have slightly higher prices. Advice here is to sell on the market. Selling freely and advancing prices with sales." There is still little if anything being done in the local market and no activity reported.

clean up well before this year's crop is ready.

HORSES.

The local market has been without interest since the first of the year, as no shipments of any importance have come in, and there is no indication that additional offerings could be sold to advantage. A renewal of shipments is expected, however, within the next few weeks, and from all indications there should be a better demand for heavy stock in the spring.

(Approximate values at San Francisco, based on auction sales.)

Publisher's Department

We learn that the veteran publisher of Los Angeles, Henry Kruckeberg, has secured the floricultural magazine California Garden, which has been published in Pasadena for the past ten years, and will move it to Los Angeles and issue it as a monthly under the title of "Suburban California." We suppose the new title means that the scope of the paper will be enlarged to take in the various agricultural activities comprehended in the name, and as "Krucke" likes fine printing we anticipate his producing a beautifully printed wide awake journal. Here's to your success.

Second Thousand Questions.

Our newest book "Second Thousand Answered Questions in California Agriculture" is just from the press and is being sent to those who gave us advance orders. This book is made up of questions and answers which have already appeared in the Pacific Rural Press. Prof. Wickson has given a good deal of time in re-editing and arranging the matter. Many of the questions are answered by staff and special writers, among them being Prof. F. W. Woll, Dr. H. B. Wintringham, Mrs. Swaysgood, Geo. H. Crowley, E. O. Essig and others.

The book contains 256 pages, is cloth bound and well printed. The matter contained is entirely different from the first book, issued two years ago, of which it is the sequel. The book covers fruit growing, vegetable growing, grains and forage, crops, soils, fertilizers and irrigation, live stock and dairy, feeding animals, diseases of animals, poultry keeping, pests and diseases of plants. The man growing fruit, grain or vegetables, or the stock and dairyman, poultry keeper or general farmer will find many a bothersome question answered.

The first volume of this work met with a rapid sale, and may be reprinted. Every buyer of "1000 Questions" will want this second volume and those who failed to get a copy of the first should surely secure this book. Price $1.50 postpaid. A special offer is made to our paid-in-advance subscribers (new and old). Send us a postal request and we will give you a chance to get this book at an attractive price.

"Please find a check for renewal of my subscription to the Pacific Rural Press. I still read it and like it, although too old to do much out of doors. This is the thirty-third year that I have taken it continously.

"Concord. Mrs. Sylvia A. Stowell."

Made-In-California Pumps Favored In East.

The largest single requisition for pumping machinery said to have ever been received by a western concern was that recently telephoned from Denver, Colorado, to the Layne & Bowler Corporation of Los Angeles. The American Zinc Company, owning extensive zinc mines near Mascot, Tennessee, through its chief consulting engineer, A. C. McDaniel, of Denver, ordered five large centrifugal turbine deep well pumps from the Layne & Bowler Corporation for the purpose of dewatering its largest mine in Tennessee. These pumps are capable of raising 10,000 gallons of water per minute. Owing to the great demand and high price of zinc, due to the war, the mining concern was in urgent need of the pumps and had them shipped to Tennessee from California by fast express, three entire baggage cars being necessary to transport the pumps and other apparatus. The express charges alone on these five pumps amounted to $13,000, but speed in shipping was of vital importance as the zinc company lost $5,000 every day the order was delayed. Three of the best installing engineers on the staff of the Layne & Bowler Corporation went to Tennessee to install the large pumps.

During the meeting of Plymouth Rock Club of Southern California, held Dec. 10, the use of the score card for judging poultry shows was endorsed.

Classified Advertisements.

MISCELLANEOUS.

SAVE MONEY ON YOUR PUMPING PLANT—We are reducing our stock of Gas Engines, Oil Engines, Centrifugal Pumps, Friction Clutch Pulleys, etc., and can name you very low prices indeed. Write us at once. Commercial Iron Works, 481-497 Fifth St., San Francisco, Cal.

MOGUL TRACTOR, 45 H. P.; used one season; fine condition; will demonstrate; have no use for it; will sell for half cost and give terms, or exchange for horses or mules Drills, discs and other farm machinery for sale. Address W. H. Hord, 704 Market St., S. F.

SECOND-HAND WATER PIPE and screw casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

APPLES!—Buy direct from producer. Newtowns, 90c; Missouri Pippins, $1.00; Bulk pack, 4 and 4½ tiers, equal proportion. No. 2 grade for cooking, 65c. Edwd. A. Hall, Watsonville, Cal.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance, WM. J. SCHROTH CO., 112-B Market St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

ETTERSBURG STRAWBERRIES — Plants: dozen 25c; 100, $1.50; 1000, $10. Delivered. E. Welty, Ripon, Cal.

ASK FOR SNOW'S GRAFTING WAX—If your grocer does not have it, send to D. A. Snow, R. 3, Box 255, San Jose, Cal.

A BARGAIN—One 60 H. P. Mogul Tractor Engine in good order. Cheap. F. P. Smith, Davis, Cal.

BALED WHEAT HAY FOR SALE in carload lots. Write H. E. Van Hensen, Hollister, Cal.

TREES AND NURSERY STOCK.

SUDAN GRASS SEED for sale by the grower, direct to farmer at a saving of 60 per cent—less than Seed dealer's prices! Choice seeds; none better. Send in your orders now while it lasts. Greatest forage crop known for dry or irrigated land. Better and finer hay than Timothy. **Wm. P. Spalding, R. F. D., No. 1, Box 64, Los Molinos, Cal.** 30c in less than 50 lbs.; 25c per lb. in lots of 50 lbs. and over.

WALNUT TREES — Late blight-resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root, as the California Black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placentia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

WALNUT TREES—San Jose Mayette, Barry Mammoth—on California Black Root, at lowest prices. San Jose Mayette, Barry Mammoth and Franquette Grafting Wood for sale. California Black Seedling Trees. Write for our low prices. Mammoth Walnut Nurseries, P. O. Box 597, Watsonville, Cal. Nurseries at 80 Tully Road, San Jose, and Watsonville, Cal.

TRIBBLE NURSERIES, ELK GROVE, CAL.—Grafted walnuts and grafted paper-shell pecans. Exclusive propagators of Tribble, Mayette, Kerr Parisienne, Glady and Improved Franquette. 19 other varieties. Fine stock of almonds, prunes, Bartlett pear on resistant roots, and other fruit trees and plants. New list ready.

1000 SACKS OF AMERICAN WONDER and High Top Burbank, clean seed Potatoes, from fields that produced 388 sacks to the acre, winning third prize in State Contest. Act quick as they will not last long. H. A. Hyde, Watsonville Nurseryman.

ORCHARD TREES, BERRY PLANTS, long on Gooseberries and Currants. To introduce my catalogue, I will send 1 doz. best bush and climbing roses for $1.50; 1 doz. different German Iris, Choice, for 75c. H. A. Hyde, Watsonville Nurseryman.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

WALNUT TREES—Eureka and El Monte varieties a specialty; also Franquette and Placentia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

EUREKA WALNUTS are the best grafted on native black roots You'll be surprised at our prices. Write today—tomorrow never comes. Geyer Bros.' Walnut Nursery, 214 S. Almason St., Alhambra, Cal.

PAPER SHELL PECANS—Standard varieties—Success, Stewart, Frotcher, Delmas and Van Dieman. 7-8 feet, $2; per 100, $150. 5-6 feet, $1.50; per 100, $100. R. Fischer, San Gabriel, Cal.

RHUBARB PLANTS—Crimson Winter 1 year, per hundred, $2; 2 year clump, each 10c. Seed per pound, $3.50. Wagner's Giant, 1 year, per hundred, $3.50. Currier Bulb Co., Seabright, Cal.

FRANQUETTE AND MAYETTE grafted on California Black. Sizes 3 to 10 feet. Prices reasonable. Special discount on large orders. Sunset Nursery, 525 W. San Carlos St., San Jose, Cal.

FOR SALE OR EXCHANGE—1500 San Jose Mayette Grafted Walnuts. Six to ten feet. Price low or will exchange on light auto or good heavy team. Chas. Story, Rivera, Cal.

FOR SALE—Two and three-year-old Mission Olives, propagated from my own trees—no mistake about variety. Also Thompson Seedless Vines. W. A. Hayne, Box 461, Marysville.

SOUDAN GRASS SEED—California grown and pure. For prices write undersigned and state quantity wanted. George Boock, Los Molinos, Cal.

WAGNER'S CRIMSON GIANT WINTER RHUBARB—Subdivided plants. $15 per 1000; $2 per 100. G. E. Shelford, Healdsburg.

SPINELESS CACTUS for seed, $5 per ton. G. E. Fillbrook, Lakeside, Cal.

BARTLETT PEAR TREES—$10 per hundred. N. M. Cunningham, Red Bluff, Cal.

PRUNE TREES—12 cents. Walnuts, 30c. Cash Nurseries, Sebastopol, Cal.

APPLES, PEACHES—10 cents. Gage Nursery, Corning, Cal.

WANTED.

WANTED POSITION as manager of Orange Grove, Highland, Redlands, or Riverside district by orchardist and nurseryman of life experience. Middle-aged, married. Thorough, conscientious work guaranteed. Best references. Orchardist, P. O. Box 102, West Riverside, Cal.

Model 83 B

With unerring judgment of value—

With a rush that swallowed up a record production in jig time—

The public took more than 50,000 of the $750 Overlands in six months.

In six months we've absorbed all the overhead; absorbed all the development expense; realized on all the experimental cost that is usually spread over a year.

We covered our material requirements at before-the-war prices—saved three and a half million dollars on aluminum and another million on steel.

We have increased our production capacity of 300 cars per day last June *to 1000 cars per day.*

So again we have broken *all* records.

Again we have planned and bought material for a bigger production program.

And again we are setting a new and supreme standard of value—

You can now buy the big, roomy, comfortable, thirty-five horsepower Overland for $695.

Here is the value which has clearly dominated the automobile market for the last six months—now made even more clearly dominant.

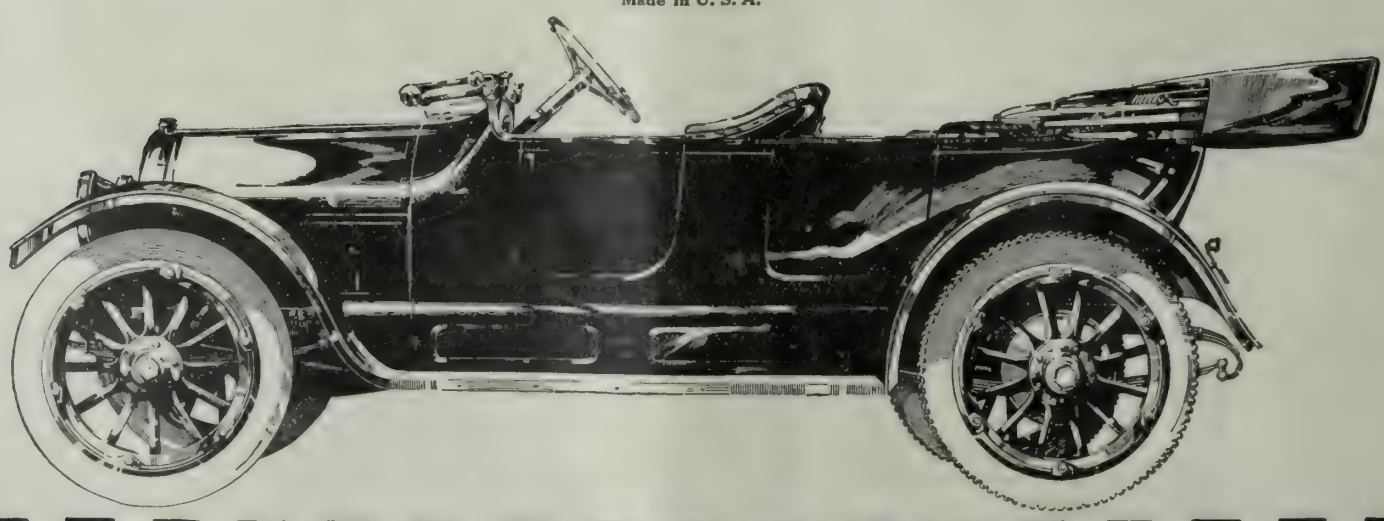
Here is the car with a performance record never even approached by any car of its size ever built—fifty thousand in every day service.

And though the price is reduced the car is improved.

It has an up-to-the-minute power plant, en bloc type, developing full thirty-five horsepower. It has abundant power and speed and an exceptionally quick get-away.

The value is pre-eminent—unapproached.

We guarantee that the price for this model will never be lower.



But this price reduction is made in the face of a rising material market—we cannot guarantee that it will not be higher.

See the Overland dealer now—anticipate your requirement if need be—but make sure of your delivery *now.*

Catalog on request. Please address Dept. 619.

The Willys-Overland Company, Toledo, Ohio

SAN FRANCISCO JANUARY 22, 1916. LOS ANGELES

What Should California Do for Bread?

Fourth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

WITHIN a century California has twice passed from a considerable surplus in wheat production to a considerable lack of it for the uses of her own population—not by flood nor drouth, nor by any other natural phenomenon, but by her own choice. In 1818 the missions produced 82,500 bushels of wheat; in 1840 the Californians were exporting to Mexico as much as 12,000 bushels; in 1850 the argonauts were crying for bread and wheat and flour were brought in ships from all the quarters of the globe. In 1860 California produced wheat beyond her own needs and began her career as a world-supply country. In 1905 California began to eat more wheat than she produced and has now for a decade ranked as a consuming country.

Of course California does not stand in general cereal production as these facts about wheat might indicate, because she is now, by a long lead, the largest barley-producing state in the union and is approaching in barley as high a producing and exporting mark in barley as she ever attained in wheat—but that is another story. Californians do not eat barley and they are rather shy in drinking it, as some other peoples do. Therefore what we do in barley does not compensate for our sin of omission in wheat and does not answer the question: "What should California do for bread?"

A Dramatic Affair.—Surely California's career as a wheat supply country from 1860 to 1895 was dramatic. If we were handy at film language we would try at a "scenario" in the hope that some moving-picture millionaire would make the films for it—but we must be briefer than that.

So long as California was turning out from fifty-five to sixty-five millions' worth of gold a year, as she did in the '50s, her small population of that day could retain its unique hold upon the world, but when that output was halved, and the people to subsist upon it were doubled, as occurred in the '60s, it became absolutely necessary to hit the world in some other way. Previous to the gold discovery the scant pastoral population secured all they wished from the outside world by sliding hides and tallow down the bluffs of the southern California shoreline upon the decks of a few trading ships, but that, of course, would not do as a means of maintaining a self-conscious American state. During the first decade of greatest gold output there was wide trial of agricultural production, chiefly for home use and to displace imports. This was successfully done with many things which did not require much skilled labor, but the crops which could be most easily, quickly and cheaply produced were demonstrated to be cereal grains. Wool, dairy products, fruit, etc., were all shown to be superlatively suited to the natural conditions but they all required more men, money and time to grow than grains did—besides grain had been hawked around the globe since the dawn of civilization and was saleable at sight and without argument wherever there were hungry people. And so, for these reasons, Cali-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., January 18, 1916.

Eureka	2.86	21.19	21.22	50	36
Red Bluff	.76	13.02	12.26	46	28
Sacramento	1.92	12.27	9.01	52	32
San Francisco	3.71	17.75	10.52	54	38
San Jose	2.02	11.02	7.64	58	32
Fresno	1.28	6.34	4.54	66	32
Independence	3.14	2.70	4.47	42	—
San Luis Obispo	4.84	16.13	8.64	60	30
Los Angeles	6.22	12.92	6.67	60	40
San Diego	*2.94	†6.68	4.40	60	38

*For 6 days.
†Seasonal to Jan. 17th. 6.68, report of 18 missing (San Diego).

THE WEEK

Those who like to base conversation on the weather surely have an enduring foundation this week. The great weather powers decided to anchor a storm off the California coast rather than off the mouth of the Columbia river, and it has resulted in a drenching such as our State seldom gets—pouring down from three to four inches of water within twenty-four hours at several points near the Southern California coast—than which, to indicate wetness, nothing more need be said—except that other parts of the state, from coast to snowy mountain districts, received their full share of the downfall. There has been regrettable hardship and loss of property from high wind, rising rivers and overflow here and there, but on the whole, of course, plenty of water is incalculably valuable and insures crops even in many places which are often too dry. This is California's share of weather disturbances, which have covered the whole continent since January began. At a point in Montana the temperature record is 48 degrees below zero. Even in Washington the cold has been sufficient to close saw-mills—which is surely a high point in efficiency.

In California we have the variety which is characteristically ours. The ocean-born storm raised the temperature in citrus places and fought the frost-bearing winds from the northeast more cheaply and effectively than orchard-warming appliances can do it, and the chances are that our great, good, warm-hearted neighbor, the Pacific Ocean, will regulate our temperatures during the remainder of the rainy season. Our recollection is that the third week in January ends the freezing—not including, of course, the spring frosts, which may visit the deciduous fruits after the citrus districts have safely passed their peril. How we may have a breath of summer even amid our severest measure of storms is shown by the fact that fresh strawberries reached San Francisco last from some point in the Imperial Valley. On the other hand globe artichokes on the coast of San Mateo met cold enough to arrest their usual winter work, which will make the crop late, and in some cases even the active plants were injured.

The abundant moisture will encourage activity in tree planting, and those who have not yet followed our advice, to make sure of the trees they needed from the nurseries, should not delay their orders. There is much new acreage going in and inter-planting among vines, which it may be necessary to displace, is being widely practiced. In the important grape section around Lodi it is estimated that the demand for fruit trees will be far greater this year than it has been for the past four or five years, during which it is estimated 100,000 trees have been set out each year. The same thing is going on in other districts.

Old Men and Old Trees.

Thinking about fruit-tree planting, we remember an old friend in the foothills who used to meet all questions as to why he did not plant some fruit trees on his place, with the answer that he was too old. And he went on that way although he lived long enough to find himself living on a bare spot in a forest of orchards which his neighbors planted. Men of ordinary old age are not too old to plant trees in California. It is interesting to note how old trees and old people get mixed up in this State. We read in an exchange that a "doctor has written a book to prove that California is the land of longevity, and declares that the average length of life in this State is 74 years, as against 44 in other States. He says that we have 400 centenarians in California and thirty in San Francisco. It is a most interesting book, and the eye is caught by pictures of a white man aged 118, a white woman 105, Indians going up to 180 and the Grizzly Giant, credited with 8000 years." Evidently the writer gets so enthusiastic that he forgets to intimate that the Grizzly Giant is a tree and not a man. But it does not matter much.

Waking Up the Traders.

The latest tidings about the California peach society is given on another page, and we hope peach-growing readers will give heed to it. Some of the environing facts about the undertaking enforce the old observation that just as soon as growers begin to hustle a little toward marketing their own products all the old dealers get enlargment of the heart. It is perfectly sure to go that way. Just as soon as a neglected spinster gets one assiduous sweetheart all the other eligibles in the vicinity begin to tumble over each other in quest of her. It is just that way with other peaches. Down Tulare way a lot of peach-growers are reported to be angry because one of them was not named as director of the society which is now a-borning. How much reason there is in their stand we do not know, but the result is what might be expected. The following is telegraphed thence: "A protest has been made and it is declared that if some satisfactory action is not taken the Tulare county crop of dried fruit will be marketed to independent buyers, who are in the field with many good offers." If the Tulare growers have swung that club as a bluff to get a director, it is no worse a thing that other lovers sometimes do, but if they meant it it shows that they have no appreciation of the fundamental requirement of co-operation which is to stand together till the heavens fall. That, however, is only incidental. What we wish to point out is that dealers are watching their chance to get the peaches, and if they can stir up strife they will soon have things going their same old way again. And then see what they are doing around Yuba City, according to this report: "Many packers are active here signing up growers on a basis of 5 and 6 cents under a five-year contract. It is believed this is being done to discourage the peach growers' organization." These things show us something more, and more important perhaps, and that is, that the drive on peaches for the last two years was not because the dealers did not want peaches, but that they wanted them too much because of the money they could make if they could get the product on the run. They practically did it, and now, because their game is threatened they are willing to get nearer to what dried peaches are worth. There is an old proverb that when knaves fall out, or get knocked out, honest men get their due. It is a peach of a proverb.

The Two Colonels.

The war is on in California. It is a little humiliating that no higher military rank than colonel can be claimed by either of the commanders—for both are assuming field-marshal services, and we hope we can have them brevetted for gallant conduct in the field before the historian begins his work. As we have weekly reported advance movements by Col. Weinstock since last November, his campaign cannot be fully understood from what is said about it in this issue, nor do we make special reference to that. His general advance is, however, intercepted by Col. Irish, whose sharp firing on another page must attract attention. Why Col. Irish hits the other Colonel in the corset and not in the collar-button, where he has won such undisputed victory in the past, we do not know—except that it may have higher strategic value as a flanking movement. In view of the difficulty of locating the cause of the European war, we wish to state, frankly, that we caused this one. We provoked it; we commissioned the officers on both sides; we are supplying the munitions, and we shall fight it out, unless our troops run away. If any of our contemporaries have protests to make, over not being admitted to this initiative, will they kindly address them to this office? Having ourselves some of the qualms of political conscience, which stand-patters, reactionaries and "loil democrats" enjoy, though we have never been all these things at once, we had an idea that the progressives should not be allowed to put this thing over without giving our readers a glimpse at what could be alleged against it. As we have long known Col. Irish as an expert in all kinds of political thought which have existed during his generation, we asked him to go to it—which he kindly does on another page of this issue. He does not shell the trenches—that is, not yet; he only shoots a little range-finder this time. What we wish to secure as the result of this war is this knowledge: Do California farmers wish to have things done for them, or do they not? Do they wish the State to do marketing, rural credit, State building by colonization, etc., or do they not? Our colonels are in fine fighting trim, and if we can keep Mr. Ford out of the State, we may find out a few things worth knowing.

A Pre-Requisite to State Marketing.

On another page will be found a few of the tentative conclusions which Col. Weinstock has reached during his recent observations on the sale of California products at the East. These will serve to keep our readers thinking and talking over such thoughts as they awaken, in their conversations and assembly discussions. One thing we particularly desire to emphasize, in view of the inchoate organizations of peach-growers and prune-growers, is the position which Col. Weinstock takes in these words, which are attributed to him:

"Undreamed-of possibilities were disclosed to me on my trip. The foundations have been laid with large banking interests in New York to finance dried-fruit growers of California, if they will organize into associations and establish standards for packed products, and permit these products to be inspected and labeled by the State. If I had had with me in New York last month warehouse receipts from any California dried fruit so standardized, I could have borrowed millions of dollars at 3½ per cent interest, up to eighty per cent, the value of such products."

Now, if Col. Irish wishes to take a shot at this declaration of what the State can do for the producer by inspection, labeling and approved warehousing, or if he can propose some other better way to do it, it's up to him. He fights under his own orders, not under ours—we only supply the highway and the munitions. But this is not our purpose in throwing out this declaration of Col. Wienstock. This is the purpose. He clearly states that he can only work through organizations of growers. When we tramped through Europe with him in 1913 we found all government undertakings proceeding through producers' organizations. Our conviction is that there is no other way. To paraphrase scripture, without disrespect, we must say: Co-operation is the principal thing: therefore, get co-operation; and, with all thy getting, get understanding also.

The Rural Credit Business.

Now it does seem that rural credit is getting to be a great business for non-ruralists in this State. Since our last issue we have read some very interesting things. Charles Remington, financial writer for the Chronicle, wrote this: "The annual report to the stockholders of the Agricultural Credit Corporation of California shows that the business of extending rural credits can be profitably conducted by private capital, as distinguished from public aid. A dividend of 8 per cent has been declared, payable to stockholders of record December 31, 1915." We have no critical objection to this statement except that it seems to intimate that some one must have thought that the rural credit business was not a good one. Perhaps there were such people. Our judgment was that it was too good a business, and the dividend of eight per cent on the money which the bankers put in to conduct the business, seems to demonstrate that. It is of course not high, in fact rather low perhaps, as compared with ordinary banking profits, but it still shows that the stockholders in this concern, if it had been a rural credit concern by ruralists on the European plan, could have taken 4 per cent for the use of their money and put the other 4 per cent in the reserve fund. Of course it is a good business for bankers, if skillfully conducted, and perhaps the manager is warranted in saying this in his report:

"The propaganda for State aid to assist farmers in competition with existing money-lending agencies was defeated, a result which might be expected for any propaganda to assist any one class of our citizenship at the expense of the other classes. This movement was not backed by real farmers, but was a propaganda calculated to secure the sympathy of farmers for the politicians and rural editors who were behind the movement."

And so the "real farmers" for fear that, if they paid less interest, they would injure another class, to-wit: the bankers and capitalists, generously voted not to pay less interest, although the politicians and rural editors did exhort them to such inhumanity! But we are not objecting. If the farmers wish to have the business done that way, they surely have the right. But how does the manager know that the farmers beat the amendment? If they did we imagine that it was not on the rural credit feature. However, they will have other chances to answer that, probably.

Queries and Replies.

Querists must give name and address.

Pruning Pears and Satsumas.

To the Editor: How shall I prune pears and Satsuma plums? My trees have been set three years and have been cut twice.—S. P., Clearwater.

Cut them again, shorting the new growth about one-half and wholly removing branches which are crossing others or making the tree too thick inside. Branches going in wrong directions should be shortened to shoots, which will occupy free space. Leave the short twigs alone as they should bear some fruit next summer, probably.

Apricot-Gumming.

To the Editor: Some of my apricot trees exude large amounts of gum on the trunk. This seemed to be fatal to several young trees, at least the dead ones had large balls of gum near the root-crown. In large trees I have seen no bad effect so far, though they were affected in the summer.—A. L. P., Kingsbury.

There are several possible causes of which, perhaps, the most probable in your case is a root-trouble, caused by too little or too much water—aggravated in some cases by alkali in the soil. We should dig out a young tree which takes to gumming badly with foliage action clearly interfered with. Gum-spots on old thrifty trees are frequent and seldom destructive. They should be treated in the way prescribed for prune-growing in answer to another question.

Plum Pruning and Gum Disease.

To the Editor: I have Wickson plum trees, one year's growth. Should they be trimmed, or let them grow as they are? Also have old French prune trees, which have gum disease. What is the best method of treatment, and when?—H. B., Reedley.

Wickson is a rapid, upright grower. You should cut back last summer's growth quite severely, just as you would a peach tree; also spread the tree by cutting to buds pointing outwards. Choose three or four well-placed shoots, cut them back as advised and remove all others. Gum disease is induced by several causes, which an experienced grower can usually discern. It may be caused by insects, by sunburn, or by soil or moisture conditions affecting the root, etc. One cannot prescribe confidently without seeing the trees. The local treatment, if there are isolated gum patches, is to cut around, remove the diseased bark and cover with Bordeaux paste. Our "Second Thousand Questions," just issued, has the formula for this and for all other fungicides and insecticides needed in doctoring trees.

Asphaltum or Whitewash for Crown Borers.

To the Editor: In connection with your answer about "digging out borers" in your issue of January 8, allow me to ask if it is necessary to apply "Asphaltum D" annually? Does not whitewash (much cheaper) give just as good results, providing trees are annually inspected and borers not allowed to get established? If asphaltum is used on all trees, especially if necessary each year, it seems that the expense makes it prohibitive.—A. H., San Jose.

We are not aware that this proposition has ever been comparatively demonstrated. but historically it is this way. Years ago whitewash mixed with crude oil, coal tar, etc., was quite freely used, but it did not serve as complete protection because such preparations disintegrated and left openings. After such experience Earl Morris, your county horticultural commissioner, used asphaltum for years, and reported that asphaltum made a covering which gave the insects no chance to get either in or out. It is not necessary to wholly renew the six-inch asphaltum band every year, but it has to be looked over and all openings in it patched with more asphaltum. We cannot speak from personal experience in the matter, but would guess that the cost of such treatment would be a small matter compared with the advantage of successfully protecting the tree. We would like to have our readers' experiences in this matter.

Fall Irrigation of Almonds.

To the Editor: I have irrigated my almonds in the fall for the past three years, with the result that they leafed and blossomed late in the fall. My soil is rather sandy loam, and trees are at least 25 years old. I have not fertilized at all. I finally attributed the cause of the second crop of foliage to fall irrigation and accordingly have not irrigated yet this fall. I do not cultivate excessively. My trees have threatened to come in blossom this fall, but a few cold nights have pretty well prevented it, and but few blossoms have appeared. What is your opinion on fall irrigation and when would you advise irrigating? I have a pumping plant in orchard and can irrigate any time in the year.—E. T. S., Hollister.

It is probably true that in your light soil allowed to go uncultivated, the moisture disappears and the trees are forced into dormancy late in the summer. If you irrigate in the fall while the temperature is high you surely start the unseasonable growth which you speak of. The trees should be well cultivated to lengthen soil moisture, and irrigation should be given before the leaves get too dry to stay on the trees and use it in finishing and maturing the season's growth. Such trees will be more likely to bear well the following year. If you are not willing to give such a late summer irrigation, wait until the cold weather comes and winter-irrigate to supplement the season's rainfall. Your trouble seems to be due to irrigating too late in the summer or too early in the fall. Fall irrigation is good for an active tree, except in places where hard frosts may injure immature wood. as is often the case in the more northerly regions of the coast, or in the mountain valleys of this State.

Peach Association Elects Trustees.

[Written for Pacific Rural Press.]

The California Peach Association with almost 3,000 orchardist members became more than a wild dream at Fresno January 12, when the legal machinery was put in motion for the incorporation of a million-dollar association of peach growers.

Although only a beginning of the vast amount of work that will be necessary in uniting a sufficient number of peach growers so that the association may control 75 per cent of the crop of the State this year, the success of the enterprise seems assured from the fact that over $360,000 has already been subscribed, trustees have been elected and both individual and community aspirations have given way to the broader view-point of State-wide representation.

The Fresno meeting put into the hands of growers the destinies of the association, thereby automatically relieving the Promotion Committee of five of further responsibility. This was done by the choosing of 25 trustees from all parts of the State who in turn will choose seven directors. These directors will sign the articles of incorporation, the by-laws and growers' contracts, and also prepare new subscription agreements. They will be selected from the trustees already elected.

The campaign for subscriptions will be again started as soon as the directors take office as there is approximately $240,000 to be raised by June 1, 1916, if this year's crop of peaches is to be handled. The rules laid down by the Fresno meeting to be followed in securing subscriptions is embraced in the following resolution, passed at the meeting:

Resolved: That it is the sense of this meeting of the subscribers to the capital stock of the California Peach Association to be organized after the election of trustees for said subscribers, that the association so organized should not undertake to exercise any of the powers to be specified in its articles of incorporation, so far as the same may involve the buying, selling, handling of or otherwise dealing in peaches or other fruits, until subscriptions to the amount of six hundred thousand ($600,000) dollars (including stock already subscribed), and crop contracts covering 75 per cent of the acreage planted to drying peaches in California shall have been procured.

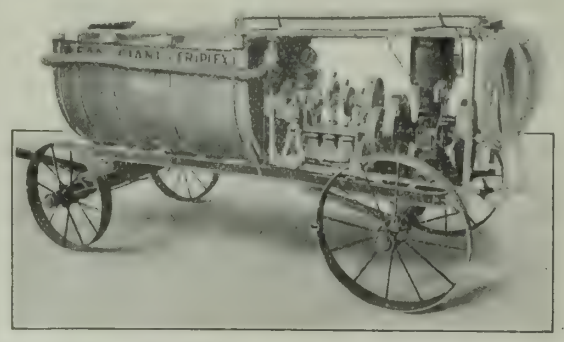
And we hereby authorize and direct our trustees to be elected at this meeting and the directors for said association to be elected by them, to take immediate steps to secure such additional subscriptions and crop contracts before exercising such powers.

Peach growers in all parts of the State should rally to the support of these directors in order to insure the success of a movement that promises to be worth many millions to the State. Whether or not this relief will come in 1916 remains entirely with the growers of the State.

GRAPE GROWERS' PROTEST.

At a large convention of grape growers held in this city January 8 the following declaration of opposition to proposed legislation was made:

"Whereas, There are to be submitted to the voters of California at the general election in November, 1916, two drastic amendments to the Constitution of the State, one prohibiting the manufacture, sale, giving away or transportation of wine and another making it a crime to serve California wines with meals in hotels, restaurants, cafes and clubs and preventing the sale of wine in sealed packages (not to be consumed on the premises) in grocery and other stores; and whereas, the adoption of these amendments will destroy not only California's wine industry, but will also cripple the raisin and table grape industries, which find an outlet for their surplus production through the wineries; will throw out of employment over 100,000 people engaged in these industries; annihilate an investment of $150,000,000; make non-productive 170,000 acres of wine grape land; destroy a revenue to the State and Nation and increase taxation, which must be made up by other industries; and whereas, the principles of the proposed amendment are contrary to the established policy of the State and Nation, which since 1862 have fostered viticulture and viniculture in California; therefore, the members of the California Grape Protective Association express our strong opposition to the adoption of either of the amendments first mentioned."



A strong movement in support of the grape growers point of view is to be organized in all grape growing sections.

FROST POTS PAINTED.

When the smudge pots are taken up in the spring, H. E. Wilkinson, a San Fernando lemon grower, has the dirt and asphalt cleared off from them and has them stacked until all are ready to dip in smudge oil. After the dipping, they are allowed to stand in the stacks until fall. Just before they are set out into the orchard again, they are dipped into hot asphalt mixed with stove distillate in the proportion of ten pounds per five gallons.

On the Limoneira Ranch in Ventura county the pots are thoroughly cleaned in the orchard by special apparatus on a wagon; coated with engine or stock paint, and set back under the trees on the highest ground possible as a general rule. They have been in the practice of setting them on newspapers, but since last winter rather doubt the desirability of this; because when a man sets a freshly painted pot on a piece of newspaper before setting it down, he practically always gives it more or less of a twist which wipes the paint off and leaves a freshly cleaned metal surface ready to rust as it stands under the trees through the summer. They are beginning to doubt, too, the desirability of leaving them on the ground all summer, for a little rust is a dangerous thing where leaking oil may kill trees or catch the frost fighter unprepared.

Pears are being planted on the C. W. Keen ranch near Acampo.

THE "BEAN" FOR RELIABILITY

You want a sprayer that is reliable—first, last, and all the time—a sprayer that will start up without trouble when you're ready to begin work and that will keep a-going until you're done. A sprayer like this can't be built in a day. There are 30 years of experience back of the Bean line—30 years of steady improvement, constant betterment, continual development. Today there are

10 Big Distinctive Features

This is the Bean Little Giant for spraying and whitewashing. Most powerful barrel pump on the market. Large air chamber and no stuffing box. Porcelain-lined Cylinders and Threadless Ball Valves.

—ten important outstanding advantages—that put the Bean in a class by itself. Among them are our Porcelain-lined Cylinders, Rustless Ball Valves, One-Piece Steel Frame, Bean Re-filler, Underneath Suction, and our matchless

Patented Pressure Regulator

which ends relief valve troubles. Holds the pressure at exactly the desired gauge. Absolutely sure, safe, dependable. When nozzles are shut off the engine works practically free, simply pumping the liquid back into the tank. This means less fuel, less wear and tear on engine and pump.

Peach Blight and Worms.

Two sprayings are necessary for the control of peach blight. The first one having been made before Dec. 15, the second should be made as late in the season as possible before the blossom buds burst into bloom. This completes the treatment for peach blight and is just in time to control curl leaf and the twig borer. Either the fall or the spring application, if lime-sulphur is used, will control pernicious scale (San Jose scale). The work should be completed just as the blossoms are appearing. In order to accomplish this the grower must be guided by the number of trees he has to spray, the weather and the capacity of his pump. In this second spraying it is only possible to do effective work with a power outfit, as the material must be driven into the rough places in the bark under a pressure of 150 to 200 pounds, instead of simply coating the branches, as was recommended for the first spraying. For this application the lime-sulphur only should be used, but it must not be used in winter strength after the trees are in bloom. If the commercial sprays, "Ortho" or "Rex," are used, dilute 1 to 11 or 1 to 8 respectively, and stir constantly while spraying.

Borers.—Twig borers were particularly destructive during the spring of 1915; and with favorable conditions for their development, they may occur again next year. The first damage from this pest is to the young shoots, causing them to wilt and die. Occasionally young trees are killed outright, but more frequently become misshapen and distorted in their growth. Later, larvae enter the fruit, causing wormy peaches. Larvae of the twig borer spend the winter just under the bark in the crotches of the limbs. By close observation, they may be detected by the frass or sawdust that is pushed out from the burrows. They leave winter quarters about the time the leaf buds open, so if the spraying is done as late as possible before the blossom buds bloom, the larvae are killed.

But to accomplish this, the liquid must be forced into the rough bark under a pressure of 150 to 200 pounds and the nozzle held close to the bark.

Curl Leaf.—It is equally important at this time to thoroughly coat the twigs and small branches for curl leaf and peach blight control.

Almonds.—Almond growers have very generally neglected to spray and many almond orchards are severely infected with peach blight. Where neglected, almond trees should be well pruned and the fall and spring treatment applied, as indicated above.

Apricots.—The shot-hole fungus of the apricot is so similar to peach blight that all apricot trees should have this treatment. In fact, all deciduous fruit trees would be benefited by a thorough application of the lime-sulphur spray while the trees are dormant. These two sprayings then are the most important a peach, almond, or apricot grower can give his trees and should not be neglected under any circumstances.

Rain.—An unusual amount of rain after the blossoming period may necessitate a third spraying. In this event, after the fruit is well set, Prof. Smith recommends Bordeaux mixture composed of three pounds of quick lime, two pounds of bluestone and fifty gallons of water. Spray followed by rain within 24 hours should be repeated.

TREATING ROOT APHIS ON PEARS.

To the Editor: In your issue of January 1st in article headed "Inspect and Treat Roots," your writer says, in reference to the woolly root aphis: "It may be easily killed by washing dirt off and dipping the roots in a mixture of Black Leaf 40, one pint per 200 gallons of water."

Sorry to say that this treatment is not efficacious in all cases, and unless a correction of this statement is made growers will be lulled into a false sense of security where trees have been thus treated. The dense masses of pear root aphis clustered among the fibrous rotos are often so protected by their woolly covering that mere dipping will not cause the liquid to penetrate the protective covering. Professor Gillette of Colorado emphasized this fact in his address at the Palo Alto fruit growers' convention last July.

Every pear or apple tree that leaves our nursery is sprayed under pressure of from 150 to 200 pounds with a strong solution of Black Leaf 40 and whale oil soap, the high pressure being necessary to break down the woolly covering and reach the aphids beneath. In the foothill belt the root aphis on pear is doing more damage than blight. When once established in an orchard eradication is almost impossible, therefore nurserymen must make every effort to send out trees so treated that they cannot possibly carry this pest. **A. L. Wisker.**

Grass Valley.

BAND WALNUTS FOR CODLING WORM.

[Written for Pacific Rural Press.]

Codling moth worms have only recently become a serious pest of the walnut. In 1914 some districts lost 25 per cent of the crop. According to Santa Barbara county horticultural commissioner C. W. Beers, there was considerable damage in that county in 1914, especially in one district about 1 by 1½ miles in extent. The season of 1915 was 10 to 14 days earlier, so that the lack of damage is presumed to be due to hardening of the nutshells before larvae arrived. Every district and most of the orchards were examined. Some nuts were found with as many as five eggs on the shuck; the larvae had pierced to the shell in many cases; but only where blight had weakened the shell and spoiled the nut already, did the worms get in.

The remedy is not spraying, if bands are placed around the trees in time. The larvae will crawl up the tree in springtime according to Mr. Beers, and they may be trapped under overlapping burlap bands placed tightly around the trees just below the crotches. This prevents whatever larvae may climb that high. They may be removed and killed periodically. Banding should be done as early as possible.

Good Bye! Mr Gopher

-and it's so easy! No bothersome traps—no uncertainty. Simply locate the tunnel, place in it a waste ball saturated with Kilmol. In 3 minutes ignite and cover up the opening with dirt. The deadly gases quickly reach every part of the burrow and it's good-bye, Mr. Gopher!

KILMOL
SQUIRLGOPHENE

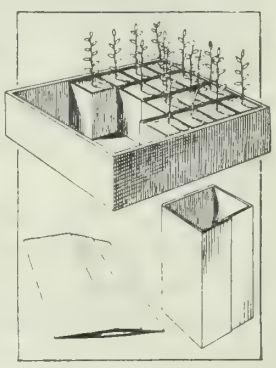
Will Kill 'Em All

Kilmol both asphyxiates and poisons—fresh air can't revive Mr. Gopher. The gas is heavier than air and so remains in the burrow for hours. Results guaranteed or money refunded. Used by Government, State and County officials with U. S. Destructor.

Get Kilmol and waste balls from your local dealer. The waste balls he sells are better and cheaper than home-made. Also ask him about new government formula of poisoned barley. Write for interesting information on the eradication of squirrels, gophers, etc.

Herbert F. Dugan
Dept. B
1170 Sutter Street
San Francisco, Cal.

U. S. Destructor, invented by U. S. officials. Forces gases into burrow.



Perforated Tree Protectors

that will keep Squirrels and Rabbits and Gophers from barking your trees. Also perfect protection from hot sun, sand storms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a Wrap to use. We make a number of kinds and can save every tree for you from pests.

COLLAPSIBLE PLANTING POTS.

These pots are bottomless. This allows you to plant the pot and plant, never disturbing your plant in transplanting it or checking its growth a single hour. Now is the time to start early Vegetables in them such as Tomatoes, Cabbage, Egg Plant, Cauliflower, Cucumbers, Cantaloupes and Squash. Also for propagating Rose cuttings, Geraniums, Eucalyptus and Conifers of all kinds. It's the only practical pot for propagating work. Write us for samples of either pots or protectors. Tell us which you are interested in.

Prune Growers Enthusiastically Organize

A mass meeting of over 600 growers adopts the form of organization submitted by the Prune Growers' Committee of 1915.

[Editorial Correspondence.]

San Jose, January 19.

The convention of prune and apricot growers, of which our columns have carried announcements for several weeks, assembled in a theatre auditorium in this city this afternoon. There were at least 900 present, and they were enthusiastic throughout in approving the work done by the Prune Growers' Committee during the last year and in approving the plans for further organization proposed by the committee. The attendance was largely from the Santa Clara Valley, but delegated representatives were present from the counties north of the bay, from Sacramento Valley and from Southern California.

J. H. Bone, chairman of the growers' committee, presided, and H. O. H. Shelley acted as secretary and presented the committees' report of the tranactions of 1915, which was approved.

Dr. Coleman of Cupertino made a stirring address, outlining the situation in prune packing and selling, expressing satisfaction with the achievements of the growers through their committee appointed last year, and urging more definite, formal and state-wide organization. He expressed the favoring attitude of the Santa Clara growers toward such an undertaking, based upon the experience of the past year.

Other speakers also approved and advised organization, including Dr. Lawrie of Napa, G. H. Hecke of Woodland, and others. Dr. Lowrie stated that Napa growers selling through the Farmers' Union, received $30 per ton more than outside growers, and urged organization. A speaker from San Benito county stated that the growers of that district had set a meeting for Saturday to take action in accordance with the recommendtions of the convention. Letters were read from prune growers in Sacramento, Sonoma and Butte counties.

Mr. Merrill presented a report prepared by a sub-committee recommending an organization to be known as the Prune and Apricots Bureau of Information, to be composed of growers of the fruits named and to be financed by assessment upon the output of growers as the Bureau shall itself decide. The policies and transactions of the Bureau are to be defined and discharged by a Central Committee consisting of thirteen members, of whom six shall be selected from the districts of the Santa Clara district (including Alameda, Santa Clara and Pajaro valleys); and one each from the Sonoma, Napa, Sacramento and San Joaquin districts, and one selected by the State Market Director.

Col. Weinstock, State Market Director, addressed the convention at length, approving the report of the committee in providing for a Bureau of Information, but advising the growers that much more than that was necessary to protect and promote the prune product as its necessities required and its opportunites merited. His plan would include standardizing and inspection so that a state label could be used; the warehousing of the product so that certificates would be accepted as security for advances and loans, which he believed could be had at as low rates as the best millionaire-securities commanded; a distribution system of the product through auctions held in leading eastern cities at such stated times as were found desirable. To do these things he advised the formation of a corporation with a capital of at least $250,000 and the signing up of a satisfactory percentage of the product.

Col. Weinstock's address was pointed and eloquent and commanded the favor of the convention. It was, however, so different in its nature and scope from the proposition made to the convention by the committee of 1915, that it was decided to adopt at once the commendation of the committee and to hold another convention, as soon as found practicable, to consider the subject of a fuller and stronger organization as outlined by Col. Weinstock.

The report favoring the organization of a Bureau of Information, as mentioned above, was then put to a vote and carried by the convention without opposing vote.

Upon motion, B. W. Folk, S. G. Cooley and F. C. Willson were appointed a nominating committee, to name members of the Central Committee of the Bureau. They reported as follows: Santa Clara District, J. H. Bone, R. P. Van Norden, H. O. W. Shelley, S. E. Johnson, C. H. Warren, John Garner; Sonoma District, J. E. Metzger; Napa District, Henry Wheatley; Sacramento District, W. A. Yerxa. Other districts, in San Joaquin and Southern California districts, were to be represented later.

These nominations were approved by the convention and the parties named are entrusted to proceed with the organization of the Bureau of Information as contemplated.

There was keen interest and confident feeling throughout the convention and much satisfaction expressed with the progress of organization so far as undertaken.

DON'T LET WATER FREEZE.

During the winter months the owner of a gasoline engine should take precautions against the freezing of water in his engine and thereby save himself much trouble. By draining the water from the radiator and water jacket at night such danger is overcome. But don't forget to fill it up again in the morning before using the engine.

When you start the motor in the morning, the first thing to do is to examine the lubricator and see that each feed is working.

Superior Northern Grown
TREES

Oregon grown trees have earned an enviable reputation in California. Many Inspectors have pronounced them the finest trees that come into their district. We have a limited surplus of the following:

PRUNES—
French on Myrobolan.
French on almond.
Imperial on almond.
Imperial on Myro.
Sugar on peach.
Sugar on almond.
APRICOTS—
Royal on Myro.
PEARS—
Bartlett. Anjou.
Clairgeau and other leading varieties.

These are all our No. 1 grade—strong, thrifty trees, good roots, clean and smooth. No cull trees that we are sluffing off at "bargain prices." Let us know your wants, now. Prompt shipment assured.

California Free Library Service.

[Some of its Activities of Value to Farmers.]

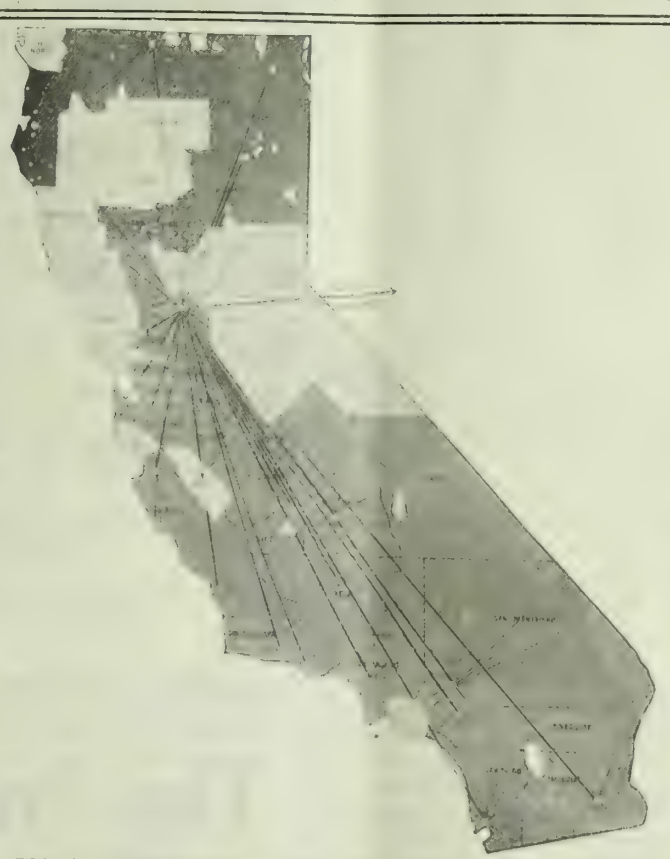
[Written for Pacific Rural Press by J. L. Gillis, State Librarian.]

The chairman of the Board of Supervisors in one of the richest and most populous counties in California recently said of their county free library: "It has become one of our permanent institutions, rooted deep into the very foundation of things." And their county free library had been in operation only a little more than two years!

And how is this enthusiasm accounted for? By the economical, equal and complete service which the county free library aims to give. In the article last week it was explained what the county free library is,—how its headquarters at the county seat are the distributing center for library material for that county and the connecting link between the people and the State Library; how from branches in every community in the county the people have access to as complete a library service as the resources of the State and county can supply; how the supervisors have the power to establish the library and appoint as librarian some one trained and certificated for the work; and how it is the business of the librarian to build up an economival, equal and complete service.

The forms of activity through which such service is given are numerous,—always interesting, often spectacular. Of course, the most frequent are the general community branches, where library service has long been as much wished for as school service. But school service seemed more imperative. The children were there! Custom demanded that there be a school to send them to. But a library? "If the people wanted books let them buy them!" The same thing was said fifty years about "schooling." "If he wants his boy to be educated, let him hire a teacher. Why should the rest of us help pay for it?" Co-operation changed that idea. And now co-operation has changed the library idea.

Broadly speaking, branches may be divided into two classes,—community branches and school branches. The community branches alone of the California County Free Library now number over seven hundred. This means that each community is a branch of the county free library, from which it receives its library service. Each branch has its supply of books and magazines made up both in kind and number as the needs of the place demand. And those needs are as various as are the occupations, industries and types of people. The man in the oil fields is glad to have books telling of the oil industry. At first he wasn't. Books on oil were sent back with the remark, "We see enough of that without reading about it." But interest increased, and in a few months, those same books were again asked for, and used till they resembled their topic in color.



The cotton grower in the Imperial Valley wants everything written on his particular pursuit. The county free library builds up a working collection of such books on cotton as will be read generally. But the man who wishes more than the county has, will have his need supplied free from the State Library. The employees in the lumber town find a great satisfaction in reading up on woods. In the sugar refinery town the people have a live interest in books on that subject. The branches in farming communities are kept busy supplying the books in constant demand on every farm subject,—alfalfa, hogs, dairying, fruits, vines, as well as on rural social and economical problems.

Other community branches verge almost on to the spectacular because of their special interest. One has been placed on a municipal recreation pier of a summer resort, so as to be accessible to the summer crop of visitors who are the town's asset. Many of the branches typify the purpose of the library to be of "service to everbody," by being located in foreign colonies, — the Swedish branches in Contra Costa and Fresno counties, the Armenian and Negro branches in Tulare, the Portuguese in Merced, the service to Germans in Sacramento,—these are only a few instances of the work the county free library is doing with foreigners.

Then there is the branch in a light house, another out in a borax mine, one in a power plant, one in a harvester camp, where in one month over 500 books and magazines were loaned out to the men. County jails and county hospitals are always among the first places to receive a branch, as the people there are especially in need of library service. Another unusual example of location is a million acre ranch (most of it in Mexico), where the employees are mostly foreigners, and many of them are making use of the library books to help them learn English.

Not only to the foreigner is the unusual or the special service given. Women's study clubs are helped, both in the planning of their programs and in procuring material for them. Chambers of Commerce and other Civic Improvement Clubs are taking advantage of the resources of the county free library and its branches. People taking up university extension work and agricultural study clubs find the county free library an almost indispensable institution. The farm adviser too is able to recommend the books he wishes read and have them furnished by the county free library. Municipal libraries which have joined (towns with libraries are not included in the county free library unless they wish) find the county able to supplement their service, and the town library thus gains a greater prestige and becomes a stronger factor in its community's life because it itself is made stronger for service.

Such are a few of the activities of the county free library in giving service through general community branches.

This is a reproduction of the huge county free library map hanging in the Ferry Building, San Francisco

Counties that are darkened have established county free libraries. White dots indicate branches; small black lines represent service to the branches from county headquarters. Broad black lines represent State library supplemental service. Arrow toward the East represents supplemental service from the larger libraries there and from the library of Congress.

CALIFORNIA GARDEN FLOWERS

If you live in Southern California, our representatives, Roeding & Wood Nursery Company, 1617 E. Washington St., Los Angeles, will take care of your orders promptly and in good order.

King Cotton Invades California.

Cotton has proved a highly profitable crop in Imperial Valley where the acreage has leaped to 45,000 in the five years since the first commercial crop was grown.

[Written for Pacific Rural Press.]

King Cotton has conquered a new domain, Imperial in extent and name. He has gained in stature and capacity by the conquest. Withal, his newest subjects are most hearty in allegiance, while many from his older realms have hastened to populate the fertile 300,000 acres of available irrigated lands in the new domain. Those from the older sections have brought preconceived ideas drawn from their experience under different conditions. In many cases this has prevented the best development of the new country. Those who have undertaken cotton growing in Imperial valley, with open minds to get the benefit of the government's expensive experiments, are planting the long staple upland variety called "Durango." They are employing methods of culture patterned after the experiences found most profitable by the most open-minded progressive growers. These methods are still changing, but they tend to produce a uniform staple 1 3-16 to 1 5-16 inches long which commands a premium of as much as 5 and 6 cents per pound over the short staple 1 to 1 1-16 inches long, according to E. A. Perkins Jr. of the Cotton Growers' Ass'n.

Great Yields.—Moreover, our friends in the old cotton States who are delighted with half a bale to the acre will scarce believe the fact that a number of Imperial Valley crops have averaged two bales per acre, and one bale is generally considered only fair. The yields for the valley mentioned below are of course reduced by ill-considered and ill-attended plantings.

Argyle McLachlan, president of the Imperial Valley Long Staple Cotton Growers' Association, says flatly, "It is economically unsound practice, as well as unnecessary, to grow less than a bale of cotton to the acre in Imperial Valley." Since he, as representative of the U. S. Dept. Agr., is largely responsible for the multiplied numbers of King Cotton's enthusiastic subjects here, having been the leading figure in the introduction of Durango, and having been in the cotton growing game since it started here in 1902 right after irrigation was brought to the valley in 1901, he speaks with authority. He is one of the few who "rogue" their fields systematically to eliminate all volunteer and foreign varieties so that pure seed may be furnished to Association members. "Roguing" is simply cutting out every plant except Durango, when they are well leaved out.

First Commercial Crop in 1909.—A few Valley farmers who co-operated with the government, grew small quantities of several varieties of cotton through the years after 1902, until in 1909 the first commercial crop was ginned by temporary machinery. This consisted of 350 bales from 450 acres. Some 1200 acres had been signed up co-operatively, in order to justify installation of a gin, but some failed to plant and some failed to pick. Among those who contributed to the 350 bales was F. W. Waite, now county horticultural commissioner. He picked an average of ¾ bale per acre from 55 acres as the result of his amateur planting. W. E. Wilsie is another pioneer, and he will plant 500 acres next season. Mr. McLachlan has since left the government service and bought a ranch on which some of the best cotton in the valley is grown.

Co-operation.—Long staple is being stimulated by the association previously mentioned. This Association is purely a co-operative, non-profit marketing agent for the growers, on a similar plan to the Cal. Fruit Growers' Exchange. It handles about a fifth of the crop and has stood ready to buy all cotton offered by growers, at prices which have kept the numerous independent buyers from depressing the growers' prices.

A warehouse was provided under bonded management and loans of $40 to $50 per bale were secured on warehouse receipts according to Mr. McLachlan.

Marketing.—The Association takes a large representative sample from each bale, labeling it according to grade (color, and quantity of leaf pieces and dirt) and length of staple. The cotton is sold to new customers by sample, while to old customers, it is sold according to the Association's grade. Mr. Waite notes that Imperial Valley short staple com-

IMPERIAL'S SPECTACULAR GROWTH IN COTTON.

In 1910, 4,000 bales were ginned. In 1911, three bales of long staple were produced, helping to make the 9,000 bales from 12,000 acres. The 1912 crop was 7,200 bales from 8,360 acres, reduced because of low prices for the preceding crop. It included 150 bales of long staple and 100 bales of Egyptian, a variety with a 1½ inch staple, but which has proved ill adapted to Imperial conditions. Some 21,000 bales were produced in 1913 from 21,000 acres, nearly a bale average for the whole valley. The 1914 crop was 44,697 bales from 38,000 acres in Imperial county and 32,000 on the Mexican half of the valley. Some 20,000 acres failed that year for lack of water, sand storms, lack of ditches and finances, oversupply of aphids, crickets, grasshoppers, etc.

Loss from over-planting by inexperienced growers, ill-conservation of water, poor preparation of land for irrigation, etc., put a crimp in the 1915 planting, which was about 15,000 acres on the American side and 30,000 acres on the Mexican side. At this writing, January 14, there is still much in the fields to be picked.

The production of long staple increased from 150 bales in 1912 to 6,000 in 1913, and 8,000 in 1914. Of 600 growers in 1914, 150 were producing long staple.

manded in 1914 a premium of $3.65 to $5 per bale (500 pounds) over that from any other section. This was largely due to the Valley's immunity from the storms that swept other sections while the previous crop was in the field. It was also partly due to the uniformity of staple (fiber) length due to control of moisture and general uniformity of conditions through the Valley.

Community Uniformity.—Mr. McLachlan points out the great advantage in marketing, which a community has where a uniform standard staple, type, and grade are grown in sufficient quantities to command attention from buyers. This can only be accomplished by adoption of a variety which tends to uniformity, and then by application of uniform cultural methods throughout the community. He believes that the variety most desirable is the long staple upland "Durango."

Many of the growers are from the older cotton states where long staple varieties have not yielded so well as short staple—hence the short staple production last year was four times as great in the Valley. But each year sees a greater acreage of Durango which really yields almost if not quite as much as the short staple Mebane which has become standard here.

Long Picking Season. — Another advantage of the Valley pointed out by Mr. Waite is the long picking season and the early planting possibilities. The first bale ginned in 1913 was July 23, in 1914 a bale was ginned at Calexico June 17 and the seed produced another crop that year. The first bale, however, came from volunteer plants. There is a practice of simply cultivating the old roots to get two or three crops without replanting, but Mr. McLachlan discourages this because it decreases yield in general, especially if practiced several years, and produces a staple which lacks uniformity. The picking season sometimes extends into Feb. because there is very little rain to injure or color the fiber.

Cultivation.—The general system of cultivation for Mebane cotton is as given by R. W. Bray of Dixieland, who says he produced 144 bales on 100 acres one year, and over 100 bales on 78 acres another. He was formerly a cotton grower in Ark., S. C., and Mo. Irrigate well, after leveling and before plowing time, which comes in March. Then run a four-horse lister through 6 to 10 inches deep throwing the ridges back into the furrows until the ground is thoroughly fined and left in ridges. Plant seeds 2 inches deep on top of the ridges and 3 to 10 inches apart, two rows at once with a machine practically like a corn planter. If the weather is warm, so the seed should come up at once, irrigate lightly right after the planter, not getting water within a few inches of the tops of the ridges. It comes up in 5 or 6 days and must be "chopped" out with hoes, when 2 or 3 weeks old, leaving stalks about 18 inches apart. Irrigate every 20 days from May through Sept. and cultivate often enough to keep weeds down. He cultivated his last crop at Dixieland only once. Some people are planting on the sides of broad, flat ridges with furrows between for irrigation. The seeds are planted half way up on the sides of the ridges so there are two rows of cotton for every furrow. This saves labor in irrigation and cultivation, and keeps the plants away from the alkali which is deposited mostly near the tops of the ridges and is more or less harmful, as in all arid countries. Mr. Waite says people are learning to plant either in March so the plants will be big enough to resist April winds, or in May to avoid those winds. They are learning also to use much less water, with advantage to the plants.

Few Pests.—Boll worm and weevil are unknown and strict quarantine is maintained to prevent their introduction, for Mr. Waite believes that where the host plant thrives, its diseases will come if allowed.

Gins.—A temporary gin was erected in 1909. Next year there were complete gins in five of the towns. In 1913 there were 8 gins, in 1914 there were 19 gins, half of which were at Calexico to care for the greatly increased crop on the Mexican side.

A greatly increased acreage will be planted in 1916, the Imperial Valley Press of El Centro enthusiastically claiming knowledge of 125,000 acres.

PRUNING THE APPLE TREE.

The months of February and March are the best months for heavy pruning, and the following suggestions may be helpful:

In removing large branches, make a smooth cut close to the stem or branch from which it is removed. Stumps left invite fungi and decay.

In reducing the height of the tree, or dehorning the tree, never leave naked stumps, but cut to a leader. This means that the side branch still would take the place of the center leader removed, and the tree would not look as if it had been dehorned.

If systematic pruning is done from year to year, there should be little occasion for the removal of large branches, as they would then have been removed when small.

Heavy winter pruning generally encourages the growth of watersprouts or suckers, and unless these are removed as soon as they appear, the amount of pruning to be done the following year will be greatly increased.

A good fruit grower will prune at all seasons of the year, for every time he walks through his orchard and sees a branch or a shoot out of place, he removes it. By such practice, winter pruning is largely dispensed with. The necessity for heavy winter pruning arises from the fact that the trees were not properly shaped and pruned before they reached the bearing age, and if the pruning and shaping has been carefully attended to up to the time the trees have reached the sixth year, the subsequent pruning would be very little. It is the neglect of the young growing trees that makes the winter pruning so heavy in later years.

What Should California Do for Bread?

(Continued from page 89.)

fornia fell into wheat at first just as all other new countries do and found out later that her wheat was in particular request because of its whiteness and softness and its blending well with the dark, harder wheats which Mediterranean and our Atlantic ports were sending to Great Britain and the north of Europe. The war of the early '60s assured good prices and California entered the list of wheat-supply countries under most favorable conditions. By 1865 the farm value of the California annual wheat crop was about equal to her annual gold product and for about 40 years continued to be greater—in some years even to doubling its value. It is really probable that, if one had the summaries, he would find that the single cereal wheat had brought to California during its export career of four decades as much value as the gold output has, from the discovery to the present day. Naturally so potent an agency, influencing life, labor, trade, invention, manufacturing, transportation, etc., has not only played a very important part in the development of California, but has shaped it to its own needs and uses. In a way, the point of view of the wheat era was born of the mining era and fitted itself to be the successor to it. As developed in California the wheat industry had an eye which could see great—as the mining industry had. It made and unmade millionaires, both in its production and in its trade. It filled the bay of San Francisco with wind-jammers, tramp steamers and other craft until the masts fairly bristled along the wharves, or the hulls were anchored in aisles or sat on the mud flats like tubs. No industry has ever peopled the harbor with ships as the wheat business did and no transportation gambler has ever made and lost so much money in any craft as in ships for wheat. Similarly, on land, no farm product has ever gathered land into such ducal areas or moved over it such capacious machinery of production or broken up so many men by its lure into speculative production or trade as has wheat. Nor has any farm land been so blackened by tragedy born of the worst passions of men as has land for wheat. In this respect also it links itself with mining in producing literary masterpieces of tragedy: for, as Bret Harte made a unique literature on the basis of California mining, so Frank Norris made, on California wheat-growing, "The Octopus," held by some critics to be "the great American novel," though he did smother his villain in a grain elevator on Carquinez straits where, to this day, there has never been one.

But we are manifestly swinging too far toward the dark side of the export wheat era. It also wrought many good things into the development of the State. It hastily subdued a vast area of wild lands which have recently been largely turned to more productive uses—to fruit planting and alfalfa growing, the latter the basis for large dairy production and for the chief part of the wonderful progress which has been made in improved livestock enterprises, for the most notable achievements with better horses, cattle, sheep and swine have been secured on lands farmed for export wheat. Wheat-growing also threw much land into good hands and the wheat trade furnished much wealth for city building. Its effect upon the development of good citizenship was also notable. Though it did wreck many families by the spirit of gambling and allied dissipation which it engendered, it stimulated a broader view of farming in others and many of the best of our second generation farmers, mentally well equipped and adequately capitalized, are the sons of the old wheat growers of three or four decades ago. It is to the wheat industry also that must be credited the most notable of the older farmsteads which one sees from train or highway—large, two-story, bay-windowed residences, generally gleaming white. As rural residence structures they are a misfit it is true, and yet it was natural enough that the builders, to emphasize their escape from cabin-poverty, should yearn for as much contrast as possible in the homes of their prosperity. And so they built white castles which could be seen from half the width of the great valley—monuments to money made in wheat or to the advance in value of lands cheaply secured for wheat growing—lands which sometimes repaid the purchase price with the first crop they bore!

An Appeal to the Prophets.—As we cannot depend upon the film artists to portray the stirring scenes we have hinted at, we appeal to the prophets to interpret their significance.

At the opening of the first "permanent" pavilion of the State Agricultural Society in Sacramento, in 1860, it was announced that "samples of California-grown wheat sent to the chief agricultural societies of both hemispheres elicit the most unqualified testimony to its great superiority—which testimony is sufficiently corroborated by the price it brings in foreign markets whither the farmers have, from the last harvest, shipped already a very large amount to various parts of the world." And the late Hon. John Bidwell, rising to this momentous fact, said this:

"From 1848 to 1853 we were dependent upon importation from abroad for almost everything — including the staff of life. In 1853 we imported 498,740 barrels of flour. How stands the case now? We are able to export half a million ourselves. In 1853 we imported 80,186 bags of wheat—now the scales have turned and we are able to export. Our success in raising to the greatest perfection this the most valuable staple of the world involves the momentous question of our capacity to augment the production with the increasing demand for the staff of life till we prove to other lands what we have already begun to exhibit, and what we can justly claim, that ours is the granary of the Pacific hemisphere." And five years later, at the State Fair of 1865 gave a confirmation of his forecast in these words:

"The soil, climate and many other features of California are unsurpassed. It is a region of wonderful variety and production. The cereals are here produced of superior quality and in larger quantity per acre

than in any other part of the United States. It would be a poor farm indeed, and poorly cultivated at that, if it failed to yield twenty-five bushels of wheat and thirty of barley or oats per acre. Fifty bushels of wheat are no uncommon crop and other grains in proportion."

In 1888 Justice N. P. Chipman, now of the California appellate court, said this: "Wheat growing in California for the markets of the world is at least precarious: average production per acre is diminishing; fertility of the soil is diminishing; we are at a disadvantage with our competitors by reason of their cheaper and better facilities for transportation. I am prepared to see Great Britain supplied from other sources within the next ten years. Lands no longer profitable for wheat-growing should be turned over to grasses and forage plants or should be planted to fruits."

In 1894 Hon. Horace Davis of San Francisco, then at the height of his activity in the milling industry of California, wrote these words: "Wheat export is the resource of a new community and of wasteful farming. I grieve to see the state wearing out its soil to give cheap bread to Europe, and every new product that can be raised profitably gives me new satisfaction. Smaller holdings, with diversified farming is the indispensable condition of prosperity here.. And I look forward to the time when this huge bulk of wheat shall be cut down one-half and for it we shall substitute a hundred different products requiring more labor, more skill, more industry and returning us more profit and greater prosperity."

All these prophets spoke true words and saw their predictions realized. General Bidwell lived long enough to see California become the leading wheat state in the Union, over Minnesota, her rival of that time, and to see her produce, in 1878 and 9, two wheat crops with a farm-value for each of over $43,000,000—more than twice the value of the California gold output for each of those years. General Chipman and Mr. Davis still live to enjoy the California advancement which they foresaw as the result of choosing other products than export wheat. In General Chipman's prescription of forage plants as a substitute for wheat we find a prophecy of the greatness of alfalfa. As we remember the utterance, his associates regarded it as a dream and not a particularly good one, either. But it surely has come true.

Problems of the Present Day.—It seems to us clear that wheat growing as pursued during the last half century is a closed chapter in California history, but what will follow? Shall we resume production of wheat for export? That depends upon what the world will pay for wheat; or, rather, what it has to pay for wheat when its needs are measured by the producing capacity of more recently opened producing regions in North and South America and the possible expansion of production in Russia, in Asia and, for aught we know, in parts of Africa. Certainly if the world's need is great enough to make a price, California can contribute to the export trade in wheat with less handicap than ever because of carriage shortened and cheapened by the Panama canal. And it may be of advantage to the state to enter again the old competition, striving to recover, by better tillage and fertilization, the acre-product which nature gave her half a century ago. It seems probable that California would have land for it which other uses of land might not call for for a century or longer. Some of the large areas to be reclaimed by river improvements now in progress may like to score in wheat and some of the deserts moistened by projected irrigation enterprises may also like the same recourse. Besides there are vast areas of uplands which can be won from wild pasturage by better tillage and the use of fertilizers. Then too if the fierce experience of Europe should make permanent prohibition policies which are now being tried as war measures, and if American prohibition should also proceed as seems likely, there would be a certain amount of the beer taken out of barley and our present product of twenty-five to thirty million dollars, farm value, might have to be shorn down to stock-feeding requirements. Then wheat, if profitable, would return to much land area convenient for cereal production and not required for other crops. But these are all speculative affairs into which one cannot surely see very far. They are all, however, what one might call real possibilities.

Something More Clear.—There is, however, one thing which is clearer and toward which this rambling discussion has been steadily tending, and that is: Should California grow her own bread or continue to purchase a considerable, and perhaps an increasing, part of it from other wheat-growing regions? To this question we have a firm conviction that the proper answer is that California should grow more wheat, and should buy less. Let us make suggestions toward that end:

First: No matter how great our population becomes and no matter how great our intensive special industries, with fruits, vegetables and live stock, may become, there will always be land for wheat. Coast valleys and uplands, interior valleys and foothills, mountain valleys, lands reclaimed by drainage, lands protected from drouth by irrigation or by rainfall conserved by tillage—everywhere in fact, up to a certain elevation, wheat can be successfully grown, if the right kind of wheat is grown in the right way.

Second: No matter how densely populated a civilized country has become wheat always retains its place in the agriculture of it; and this is true although wheat is usually the first offering of a wild, new country to the world's trade. The friend of a country's youth does not forsake it in its advancing age. Take a few of the countries which depend most upon importing wheat, and note what part imported supplies of wheat comprise of the total consumption in each case:

Great Britain, three-fourths imported;

Germany, one-third imported;

France, one-ninth imported;

Italy, one-fourth imported;

Spain, one-fifth imported;

California, One-half Imported.—Great Britain is in a class by herself because of large population of trading, manufacturing and leisure classes and enforced idleness of so much land. The other countries are better instances of small farms and intensive agriculture and they are largely producing their own wheat, as the fractions show. In their cases the grain is produced chiefly as a part of the output of small and diversified farming. Of the several countries France most resembles California in area and farm products, and to support her population, which is fifteen times larger than ours, she only needs to import one-ninth of her bread-requirements, although she is giving so much land to high-class, special soil products like those California is developing. France is

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

WHAT SIZE ENGINE?

To the Editor: I am expecting to purchase a small power outfit to shell corn, grind it, grind bone and also to saw wood and turn the washing machine. I have no part of the outfit yet and wish to get the most economical small outfit that I can. Might I do better to get a 3 h.p. engine? I know that the 2 h.p. engine will run as large a corn sheller as I want and think it would do for a grinder. Can I make it run a wood saw, even if I am careful not to crowd it? Could I throttle a 3 h.p. engine down to run a washing machine or grindstone without waste of gasoline?—R. E. Smith, Bishop, Cal.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[A one-hole grain sheller will require about 1½ h.p. Feed grinders are made to consume almost any amount of power from ¼ h.p. up. The power consumed by any one grinder varies directly with its speed. The amount of feed ground varies also in like manner.

A wood saw for sawing fire wood where the logs are of considerable size, will require about 3 h.p. for successful operation. One-half h.p. will be sufficient for a washing machine and perhaps ¼ h.p. for a grindstone.

It would seem that if the correspondent has much wood sawing to do it would be best to have a 3 h.p. engine. This can be used to operate a feed grinder which will have such a capacity as not to require a magazine bin for supplying the unground feed. It is a waste of time to attend continually a very small feed grinder. No doubt it would be best to install a short line shaft with suitable pulley enabling several of these machines to be operated at once, thus saving not only fuel for the engine but also time for the operator.]

ARTESIAN WELL DRILLING.

A letter was received by the U. of A. Agricultural Experiment Station recently from a settler in one of the artesian districts of Arizona, stating that his artesian well had been drilled to a depth of 650 feet and cased with a three-inch pipe, and that a two-inch hole had been put down another hundred feet, which was the limit of depth possible for so small a diameter. The resulting flow was only eleven gallons per minute, which will irrigate from one to two acres of land only, and it neither permits of farming operations nor of proving upon the desert entry. The letter inquires how to transform the artesian well into a pumping well. In reply, it is stated by Prof. G. E. P. Smith that perhaps the best thing to do is to excavate a pit over the well to a depth of forty or fifty feet, to line the pit with concrete, to disconnect the three-inch pipe at the bottom of the pit and to place the pump suction at that depth. It may be possible to develop seventy-five gallons a minute, which is a comparatively small discharge. However, it is practically impossible to make a good pumping well out of the present well, and the present investment is wellnigh lost, since it is desirable now to put down a new and larger well.

It is a great misfortune that larger wells are not drilled in the first instance, inasmuch as the cost of drilling a six- or eight-inch well is not materially greater than the cost of a three- or four-inch well. The ideal way is to put down a 16-inch casing to a depth of 100 feet, and then put down inside of this big casing a smaller casing, say a 6⅝-inch, to the artesian strata. This gives a much greater opportunity to develop the artesian flow, but if the artesian flow is not sufficient, then a centrifugal pump of ample size and high efficiency can be lowered into the 16-inch casing, and the well can be pumped under the most favorable conditions. If the water-bearing strata are within 300 feet of the surface, then the 16-inch casing should be used for the full depth.

TRACTOR CONTEST AND USES.

We are advised by W. Kimball of the Pacific Metal Products Co., who handle the Ideal tractor, manufactured by the Union Tool Co., at Torrence, Cal., that several tests have been conducted by that company during the past few weeks to determine the relative merits of horse power and tractor power in farm operations.

One of the most interesting of these tests was a contest between the Webb brothers of Linwood, each of whom had 32 acres of virgin soil which they wished to plow. One brother used an Ideal tractor while the other satisfied himself with two five-horse teams.

The horses were worked at top speed while the tractor was sent on its steady grind. News of the contest spread throughout the district and crowds gathered to see the contest. The tractor gained from the start. It not only did the work cleaner and better but did it much cheaper and at the end of a day's work there were no hungry, tired horses in the tractor barn. The contest was an easy victory for the tractor.

According to Mr. Kimball the Ideal uses only a gallon of distillate an hour and the following list gives an idea of the wide scope of work the modern tractor will perform:

Pull up trees and stumps; pull land drag, scrapers, road scrapers, road grader, rollers and crushers, plows, disc cultivators, harrows, seeders, mowers, reapers and binders, thrasher, rakes, bean planters, bean thrasher and cleaner, potato digger, manure spreader; run ensilage cutter, silo fillers, hay hoist and loaders, hay balers, corn husker and shredder, corn sheller, run feed mills, alfalfa cutter, wood cutters, pumps, milk separators and haul wagons and trailers.

AN ERROR.

In the article "How to Figure Tractor Horse Power" in our issue of January 8, the example given should have been

Px Sx5, 280 ft / 3300x60 instead of Px Sx5, 280 ft / 350x60

The Standard Soil Tester At Your Service

It Will Show You Accurately:

1. Whether a soil is in the right chemical and physical condition.
2. Whether a soil is **slightly, moderately** or **extremely acid.**
3. How much Lime is needed per acre to counteract the acidity
4. What quantity of Carbonates (Lime and Magnesia) a soil contains. It will indicate quantities, both in "percentage" and "in tons per plowed acre." From this you will see whether a soil is lacking in them or has plenty of them.
5. Whether disclosure of Carbonates is Alkali or Lime.
6. Whether a soil is lacking in Humus. It will show you whether a soil contains 1 per cent or more, ½ per cent, or none.
7. Whether a soil is in need of a green manure crop.
8. It will demonstrate the probability as to whether a soil will respond to applications of chemical fertilizers or not.

"Jackson MADE"

Write for Catalog No. 47 F

A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

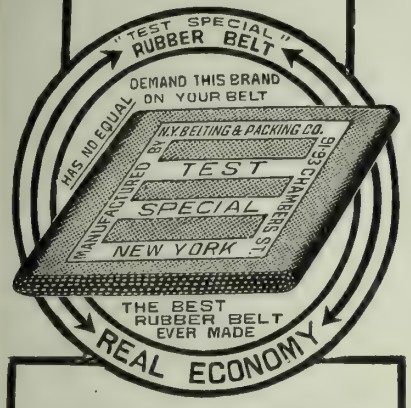
WHY A DIFFERENCE IN POWER?

To the Editor: I am interested in gas tractors and read with interest, Mechanical Power on the Farm in your paper. I bought a Samson Sieve Grip tractor in September, 1914, and sold my six horses which had previously done my work. When I had the tractor one year it had done all my work and enough outside to pay for itself. Of course I have not allowed myself any wages but counted all I paid out for hired help as I had to run it day and night when there was work to be had. It is a 12-horsepower pull at the draw bar, but there is one thing I don't understand, and that is why I can pull a 26-foot harrow (140 spike tooth) on high gear as easy as I can a plow of five 10-inch shares on low gear? The plow is a 12-horse load and it would take 12 horses to pull the harrow, but the tractor is only supposed to have six horse power on high gear, although it handles the harrow with ease. Perhaps some good reader could answer this question.—W. M. Lewis, Byron.

[Comments by Prof. J. B. Davidson, University Farm, Davis.]

The draft of a gang plow with five 10-inch beams or shares when plowing 5 to 7 inches deep will be in the neighborhood of 1000 to 1500 pounds. This will make a good load for the corerspondent's tractor when working on low gear. On the other hand the draft of a 26-foot spike tooth harrow ought not to be more than 600 to 800 pounds.

Harrows are light draft implements and it is not possible to load a horse as heavily when attached to a harrow as when attached to a plow, owing to the fact that walking over soft ground is more laborious than when walking over firm soil. Of course it is to be recognized that soft ground influences the power of a tractor as well as the power of a horse. If the harrow is attached closely to the tractor its draft may be somewhat less than when attached to a horse team. This is due to the lifting action produced by the close hitch. The harrow however, in the latter case, will not do as much work in pulverizing the soil.



STARTING ENGINE.

Try starting without priming. Try priming it, then crank. If it does not start, we suggest that you open the pet cocks in the end of each cylinder and turn engine over until the surplus oil has been blown out. Prime it again and crank. If no result is obtained, remove spark plug wires, hold them about one-fourth inch from the plug, turn engine over and see if you get a spark. If not, we suggest that you start looking for the cause at the dry cells or batteries. Test them, and if below 12 amperes you will have found the cause. If you can trace the spark to the magneto and not to the end of the spark plug cables you will know that it is in the cables, and they may be either oil or water soaked. You may find that the breaker box should be thoroughly wiped out—there may be too much oil in it. If your engine starts to skip don't jump to the conclusion that it is the carburetor adjustment or magneto trouble. The chances are that it is caused from water in the gasoline. Open the pet cock in the side of the carburetor and drain off a little. If this don't do it, you had better examine the gas tank and gasoline feed pipe leading to the carburetor from the tank and see that it is not stopped up. At this time of the year you will find more water in the gasoline than in the warmer season. This is on account of the colder weather, which causes the tank to perspire, both inside and outside.

Strain the oil in the crank case at frequent intervals.

Longer and Better

BELT SERVICE

We will give you longer and better BELT SERVICE than you are now getting at no greater cost than you are now paying.

Fill out the blank form below, mail it to us today, and we will send you a **FREE SAMPLE** of a Rubber Belt that we will recommend and unqualifiedly guarantee to perform the work satisfactorily; we will also send you free a little folder "How to determine the quality of Rubber Belt." General Agricultural Review.

DECIDUOUS FRUITS AND NUTS.

W. H. Street is planting 800 cherry and almond trees on his ranch northwest of Lockeford.

There are 7,000 acres of fruit in San Luis Obispo county, including 3500 acres at Atascadero.

L. M. Washburn of San Jose has leased the Sargent orchard near Gilroy for a period of 10 years.

San Jose men are contemplating the erection of a cannery at Hollister, which is badly needed there to care for the fruit of that section.

C. C. Woodruth has recently purchased 80 acres of land north of Acampo which he is planting to almonds.

A total of 55 acres of almonds will be planted near Porterville the coming season. This is a comparatively new crop for that section.

The New England-California Co. are making arrangements to plant 200 acres of almonds and olives on their ranch near Ripon this spring.

Several farmers in the vicinity of Orland will plant prunes this spring. This is the result of protable yields in the older orchards of that section in years past.

The U. S. Department of Agriculture leased 15 or 20 acres of walnuts last fall for a long term of years so that a thorough study of blight may be carried to successful conclusion.

G. A. Nehrhood of Paso Robles is exhibiting almonds from an old neglected orchard seedling which bore 128 pounds last year. They are rather small but well filled with meats of fine flavor.

Peach root borer has been found in some of the nursery stock that has been shipped into California from Oregon and horticultural commissioners are closely inspecting all trees from that State.

The Goleta walnut house of the California Walnut Growers' Ass'n handled about 900 tons the past season, despite the worst visitation of blight ever experienced. About four tons were from budded trees.

The heavy frosts early in January froze the tops of the year-old fig trees in Merced county and about one-third of the acreage was set back a year as a result. The orchardists of that county are busy pruning their trees at present.

Sufficient acreage will be planted this year to insure the establishment of a big green fruit shipping section around Oroville in the future. It is believed that this year will see the total acreage of shipping plums brought up to 150 or 170 acres.

Orchardists in the prune district of northern Sonoma county are making heavy plantings of prunes this year. A report from there says that there will be 2,000 acres of that fruit set out this spring. About one-third of the trees will be Imperials.

Acocrding to figures given out at Paso Robles the orchard acreage in that section will be materially increased the coming year. A total of 1626 acres is to be planted. Almonds lead in popularity among the new growers, followed by prunes.

In a statement made at Fresno last week, W. D. Bennett, sales manager for the California Fruit Exchange, announced that that concern will endeavor to organize the San Joaquin valley districts this year and that they have already appointed a manager for that section.

It is estimated by nurserymen that the acreage of fruit trees planted in the Lodi section this year will exceed that of previous years, because of the fact that many vineyardists are planting fruit trees among their vines. Cherries, plums, pears and almonds are the varieties being mostly used.

The Texas Prolific at Paso Robles blooms three weeks later than the Nonpareil, I. X. L. and Ne Plus Ultra, according to Carl Nichols, the recently appointed horticultural commissioner. This makes the Texas variety available as a pollinator so Drake Seedlings are being planted for pollination.

VINES AND RAISINS.

Extensive plantings of vineyards are being made in the vicinity of Tudor, Sutter county.

According to E. M. Sheehan of the State Viticultural Commission, there were 124,000 tons of raisins produced in 1915, compared with 90,000 tons in 1914.

A consular report from Valencia, Spain, states that the November estimate of the Denia raisin crop of 10,000 tons was high and that the crop will not amount to more than 6,000 tons and may not surpass 5,000.

The vintage of wine in France last year was only about one-third as large as that of the year previous, there being approximately 477,000,000 gallons made there last year. The French government reports old stocks in hand at 185,000,000 gallons.

Raisin growers who belong to the California Associated Raisin company have better credit than those growers who go it alone, according to bankers in the San Joaquin valley, who have great faith in the raisin association and have promised to do everything towards its advancement that is possible.

CITRUS AND SEMI-TROPICAL.

Secretary McAdoo has recommended to Congress the immediate appropriation of $300,000 to be used in fighting citrus canker.

The Teague-McKevett Lemon Co. of Santa Paula have purchased 40 acres of land which they will plant to lemons the coming season.

J. K. Catlin's lemon crop from old trees in Santa Barbara county was increased from 3000 field boxes in 1910 to 17,000 boxes in 1915 by pruning to renew fruitwood.

On account of the prevalence of the white fly pest, all citrus fruit trees shipped from Marysville will be inspected by horticultural commissioner G. W. Harney.

Tulare county will have shipped about 4125 carloads of oranges before the season closes. Of this amount 1823 cars were sent from Lindsay.

According to a consular report Winnipeg, Canada, uses about eight carloads of oranges weekly from December 1 to April 1. Florida oranges are being pushed in that market.

Reports from Riverside and Redlands indicate that the orange crops there are of exceptionally fine quality. Picking is being delayed by rains but what is being shipped is running to large sizes.

Preparations had been made by the packing houses in Riverside to ship 100 cars of oranges last week if the weather had permitted. The heavy rains early in the week, however, stopped all picking and shipments fell down as a result.

The eight to one test of oranges which the Pure Food Bureau has been advocating is reported to have been killed in Congress last week. The bill was amended so as to give the Department of Agriculture control over shipments of grain and other non-perishable products.

L. R. Boedefeld, horticultural commissioner of Colusa county, has notified owners of citrus trees in that county that they will have to spray their trees for the yellow scale. Unless it is voluntarily done the county will do the work and charge owners for the work.

The orange crop in the Corona section is reported to be smaller than that of last year but it is believed that the difference in the size and quality of the fruit will more than make up for the shortage. There are but few lemons in storage at the present time.

Argument on the Citrus Protective League's case before the Interstate Commerce Commission will be held in March to recover the difference between rates as high as $30 per car on pre-cooled citrus fruit, and the $7.50 per car which was ruled in 1911 to be reasonable.

Notwithstanding the frosts which have visited practically all of the citrus districts of the State in the past two weeks, very little damage is reported from any of the large citrus districts. Smudging was general in some sections, but moisture from rains, the dormancy of the trees and the maturity of the fruit are all said to have been of great assistance in withstanding damage.

Deglet Noor dates have shown fine growth near Heber, Imperial Valley but have failed to ripen fruit satisfactorily because of the low, cool, moist, hard soil and air conditions. A representative of the Ex-

IF YOU HAVE SHALLOTS, make offer to C. C Morse & Co., 125 Market St., San Francisco.

PRUNE TREES—12 cents. Walnuts, 30c. Cash Nurseries, Sebastopol, Cal.

APPLES, PEACHES—10 cents. Gage Nursery, Corning, Cal.

WANTED.

WANTED—About sixty young men and women to enter the WESTERN NORMAL on January 1, 1916, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information address, WESTERN NORMAL, J. E. HUMPHRIES, Principal, Stockton, Cal., Box 704.

WANTED POSITION as manager of Orange Grove, Highland, Redlands, or Riverside district by orchardist and nurseryman of life experience. Middle-aged, married. Thorough, conscientious work guaranted. Best references. Orchardist, P. O. Box 102, West Riverside, Cal.

EXPERIENCED, RELIABLE RANCH SUPERINTENDENT wants position. Diversified farming, dairying, irrigation, registered live stock, poultry; references. Box 202, Pacific Rural Press

YOUNG MAN, 21, wishes position on stock ranch. General experience with horses and some months with cattle. Best of references. F. Bennett, 2659 Filbert St., San Francisco.

Experienced Swiss Dairyman wants dairy on shares—10 to 15 cows. Box 203, Pacific Rural Press.

LAND FOR SALE.

DO YOU KNOW that you may NOW apply for any of 600,000 acres of California School land?

DO YOU KNOW that you can NOW get lists and STATE MAP of 600,000 acres of SCHOOL LAND for $2.50?

DO YOU KNOW there is 20,000,000 acres of GOVERNMENT LAND in California, some in nearly every County, that is vacant? Some of it was taken years ago, and allowed to come back to Government; NOW supposed to belong to absent owners.

At great expense of many thousand dollars we have searched out these sections or parts of sections, marked Government land on County sectional maps, different color, with streams, railroads, wagon roads, other data, plainly enough for 14-year-old child to find some of the best tracts. Maps, $2.50, any County.

DO YOU KNOW that in Australia and New Zealand the Government searches out the land, helps people get it? We do a similar work here for YOU. For $5, we will send you lists, particulars, services, make applications for you, until 1917. It will pay you to send for our full services; $5 for lists, any 3 counties; $2.50 each for 3 County Sectional maps; $2.50 for school land State map, total $15. While we will send you any part of this service, we know that those who send for COMPLETE SERVICES get best bargains, better satisfied, get the best results. We recommend their plan to YOU. Order NOW. JOSEPH CLARK, Manager. CALIFORNIA STATE LAND INFORMATION BUREAU. office and residence, 1511 K Street, Sacramento.

EXCHANGE For stock or grain ranch, low altitude; best little apple orchard in the famous Rogue River Valley of Southern Oregon. Sightly location, right in the ideal residence city of Ashland, 5,000 population. Averaged 900 boxes Spitzenburgs and Newtowns past ten years. 1916 crop, 1,400 boxes, will bring about $1,700. Price, $7,000. O. H. Barnhill, owner, Ashland, Ore.

CALIFORNIA LAND—Money-making little farms, high class, low-priced properties in all counties. Call or write the oldest land office in California; we will save you 25 to 50 per cent. C. M. WOOSTER CO., 303 Phelan Building, S. F. Catalogue free.

FARMS WANTED—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 93 Palace Bldg., Minneapolis, Minn.

LONG LEASE ON SHARES—Old established nursery. Wholesale and Retail. Good terms. Full particulars, write Tribble Nurseries, Lodi, Cal.

ORCHARD, ALFALFA, STOCK OR RICE RANCHES for sale or exchange. Alex. T. Gibson, P. O. Box 361, Chico, Cal.

20 ACRES IN ALFALFA adjoining Kirkman Nursery, near State Highway. Fine pumping plant. S. H. Kunkle, owner, Madera, Cal.

WANTED GOOD FARM, or unimproved land from owner H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

periment Station believes that the Haynai (Virket) or Sandy varieties would do well there. But he emphasizes the need of knowing variety requirements of soil, temperature, humidity, etc., and of putting each variety in suitable locations, of which there are many in Imperial Valley.

FIELD CROPS.

Dealers estimate that there are about half a million sacks of potatoes still in warehouses at Sacramento and Stockton.

The cantaloupe shipments from Brawley, Imperial county, totaled 4,721 carloads last year.

Fourteen hop growers of Mendocino county disposed of their hops recently at prices ranging from 8½ to 10½ cents a pound.

The sugar factory at Fallon, Nevada has been purchased by a new company this month, who will endeavor to run it next fall.

Announcement is made that the sugar factory at Corcoran, which has been closed several years, will be opened to handle the beet crop of 1917.

Stanislaus and Merced counties produced $325,000 worth of beans last year and we are advised that the acreage this year will exceed that of previous years.

According to reports from Turlock there will be 2,000 acres of cantaloupes planted in that section this year. There were 1500 acres planted there last year.

About 20,000 bales of the Imperial Valley cotton crop had been ginned up to the middle of January. The 1915 crop is light on account of frosts in Novemer.

Members of the Glenn county farm bureau have decided to establish a market commission in the county, through which farmers will be able to buy and sell direct.

According to County Horticultural Commissioner A. E. Beers of Merced county there was about 48 per cent of the total farm land in that county under cultivation in 1915.

Mr. Gallagher of Galt is seeding 40 acres of alfalfa this season. He has secured 100 pounds of sweet clover seed from Colorado which he will sow as an experiment on dry land.

Over 1,400,000 sacks of beans were harvested in Santa Barbara county last year, and it is the belief of farmers there that the acreage this year will be larger than last year's.

A report from Stockton says that the demand for beans is improving and that dealers in that city expect large shipments during the latter part of January and the fore part of February.

Henry Majors and Elmore J. Lee of Watsonville were awarded third prize in the potato growing contest conducted in the State last fall. They secured a yield of 22½ tons to the acre at a cost of $165.

Practically all of the onions now held in warehouses at Stockton are owned by dealers at this time. Prices have improved considerably during the past week and many dealers are expecting them to reach $4 per hundred.

Andrew J. Young of Huntington Beach has developed a new lima bean which is thought to be far superior to other varieties on the market. The bean yielded 40 sacks to the acre last year under adverse conditions.

The Pacific Rice Growers' Ass'n report the sale of 21,662 sacks of rice between January 3 and 12. The greater part of this was Japanese and brought right around $2.00 a hundred on the average.

According to the chief inspector of the San Francisco Chamber of Commerce there were 20,000 tons less barley stored in warehouses at Port Costa, Stockton and San Francisco, January 1, 1916, than at the same time in 1915.

Steps are being taken by merchants in Oroville to comply with a recent suggestion from a farmer of that vicinity, to open a pulic market where farmers could dispose of their produce without paying excessive commissions.

Grain dealers in the San Joaquin valley estimate that there are somewhere near a million acres of grain planted in that valley this year. A 50 per cent increase in the acreage is reported on the west side of the valley and a 25 per cent increase on the east side.

According to government figures Nevada produced during the year 35,000 bushels of corn, 1,600,000 bushels of wheat, 585,000 bushels of oats, 576,000 bushels of barley, 2,240,000 bushels of potatoes, 675,000 tons of hay in 1915.

The directors of the State Agricultural Society have fixed the date of the California State Fair September 2 to 9 inclusive. If present plans are carried out this year's fair will be larger and better in every way than any held in the past.

The U. S. Department of Agriculture announce that they will work with the California Water Commission at points in the Sacramento valley the coming year, to determine ways and means of developing the rice industry in the State.

E. S. Malis of the California Polytechnic school at San Luis Obispo notes that cuttings of roses, geraniums or other less common plants, unless a clean cut is made on the end that goes underground, do not callus, but rot. The top may put out leaves, but soon dies.

The completed plans for the formation of a Lima Bean Growers' association, organized along business and legal lines, a non-profit, non-capital, marketing organization that will put the bean growing industry on a substantial basis, were submitted to the organisation committee last week at Ventura.

In his annual report for 1915, Farm Adviser Niles Searls of Yolo county made plain that the duties of a farm adviser are many and varied. Here are a few of the things which he has been responsible for: Hogs vaccinated for cholera, 750; hogs vaccinated for cholera by others on adviser's suggestion, 2000; farmers visited, 532; farms visited, 953; business calls made on adviser in his office, 228; cows tested for milk production through testing associations, 1500; animals tested for tubercolosis on adviser's suggestion, 105.

Save Money on Wire Fencing!
-send for WHITING-MEAD'S Free 1915 catalog showing how to save 20% to 40% on Building Material

Warner Fencing $4.10, $4.90, $5.55 per Roll, for Stock and Poultry

This class of fencing is known all over the country and usually sells for considerably more. First placed on the market some ten years ago to meet the demand for a substantial combination stock and poultry fencing.

It is closely woven and made of No. 14 galvanized wire, the spaces between the wires being graduated from the small mesh at bottom to keep chickens in, to the regular stock fence mesh at top. Has heavy cable edge at top and bottom, which enables it to withstand sudden shocks without injuring the fence.

Ten rods to roll and sold in full rolls only.

Height inches	Approx. Wt. per rod	St ays in ches	Bars number	Price per roll
35	7	6	15	$4.10
45	8	6	17	4.90
55	9.2	6	20	5.55

POULTRY FENCING $3.25, $3.60, $4.30, $4.90 PER ROLL—GRADUATED MESH—GALVANIZED

Has many advantages over the ordinary poultry n etting, being three times as strong, does not require a top or bottom board, as the selvege wire at top and bottom may be stretched to give perfect close fit to ground, and the top affords no place for chicken to rest.

All the features of the popular heavier fencing, including the interlocking mesh, with special graduated mesh to keep small chickens in. Sold in full rolls. 3 ft. high, $3.25; 4 ft. high, $3.60; 5 ft. high, $4.30, and 6 ft. high, $4.90.

WARNER HOG FENCING $5.00

Specially woven hog fencing, with barb wire selv ege at bottom, which effectually prevents hogs raising the fence, and does away with the necessity for and ex pense of bottom boards.

Made of best quality No. 14 galvanized wire, he ight 26 inches; weight per rod 4.5; stays, 6 inches; with 7 bars barbed at bottom. Sold in 20-rod rolls only, $5.

POULTRY NETTING 45c, 60c, $1.10
GALVANIZED—2 IN., 1½ IN., and 1 IN. MESH.

A great special buy, amounting to almost a full carload, in these much wanted sizes. Remember, it's all perfect in every way.

1 in. mesh, $1.10 per 100 sq. ft., 18, 24, 36 and 48 i nches high. 1½ in. mesh, 68c per 100 sq. ft., 24 inches high only. 2 in. mesh, 45c per 100 sq. ft., 18, 24, 36 and 72 inches high.

These prices will apply only so long as this lot remains in stock, so get your orders in early as they will be filled subject to stock on hand.

FENCE STRETCHER AND COMBINED HOIST $1.25

A most necessary tool in erecting wire fences and very handy to have on the farm at all times.

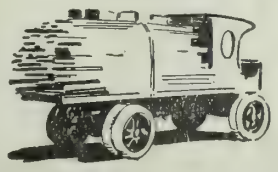
May be used as a lifting hoist, similar to block and tackle, has automatic catch which holds wire or load at height required. Thousands in successful use. Two sizes, $1.25 and $1.50 each.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet	$1.15
2-ply, double-sanded, per roll of 108 square feet	$1.40
3-ply, double-sanded, per roll of 108 square feet	$1.65
1-ply "King" smooth, per roll of 108 square feet	$1.25
2-ply "King" smooth, per roll of 108 square feet	$1.50
3-ply, "King" smooth, per roll of 108 square feet	$1.75

Send for free sample. Remember we ship direct to you.



Everything in New Building Material for Less

PAINTS! PAINTS! PAINTS! WE BEAT 'EM ALL PRICES

Our paint department is now in full swing, a complete stock having reached us since the recent fire. We can give you the lowest prices ever on paints, brushes and painting supplies.

Standard House and Floor Paint $1.50 gallon.
Standard Porch Paint $1.75 per gallon.
Black Graphite Roof Paint 50c gallon in 5 gallon lots.
Standard Shingle Stain 50c gallon in 5 gallon ots. All colors except grey.

Oregon Pine $10 to $15

—Good new rough Oregon Pine Lumber, all sizes, at $10 to $15 per thousand.
—Oregon Pine Lath, 4 ft., new, $2.50 per thousand.
—Best grade Slashed Grain Oregon Pine, sanded finish, $37.50 per thousand. This makes a beautiful interior finish.
—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

$30 Wallboard $19.00

The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fibre board. Cheaper and neater than plaster or lumber and any one can install it in one-quarter of the time. Per 1000 square feet

$19.00

PRELIMINARY VIEWS OF STATE MARKET COMMISSIONER.

If the farmers of California will organize into one great cooperative organization, standardize their products and co-operate with the State Market Director, so that they can have their goods inspected and stamped with the label of the State, they will be able to borrow from New York banks, 80 per cent of the market value of their goods on warehouse receipts at the low interest of 3½ per cent per annum.

Such was the announcement of State Market Director Harris Weinstock, upon his arrival home after an extended trip through the east, investigating markets for California products.

Colonel Weinstock states that his first work will be to aid in strengthening the growers' organizations already formed and the promotion of new organizations of producers. He realizes that he can do very little towards solving the present marketing problems, if he tries to deal individually with the thousands of farmers in the State.

He is of the opinion that one of the costliest things, if not the costliest thing, to the producer and consumer of perishable products is the glutting of markets. The interest of the producer in preventing gluts lies in the fact that gluts kill prices and make the industry unprofitable. On the other hand, gluts are usually followed by famines, which, for the time being, serve to boost prices for the consumer. It is the interest of the consumer that the market shall be steadily supplied so as to minimize speculative prices and to keep the cost down to a point where the farmers can live, and yet enable the consumer to get his supplies at a reasonable figure.

The regulation of the market supplies, therefore, is a vital factor, and this can only be done by having the growers thoroughly organized. Which emphasizes the importance on the part of the commission market to devote its fullest energies in aiding the growers to bring this about.

Even when the producers are well organized, as in the case of the citrus growers, he believes improvements can be made which will mean a big financial saving to the State. He thinks the fluctuation in orange prices can be remedied by the establishment by the commission market of a clearing house through which citrus products can be properly distributed without associations of orange or lemon growers losing their identity. One reason citrus growers have not established a distributing bureau has been fear of the Sherman law. He argues that the Sherman law does not prohibit such an institution.

That the market commissioner will lose no time in his effort to aid growers' organizations is certain and his work will be eagerly watched by the farmers of the State.

Jobbers' and retailers' costs of distribution, published by the Cal. Fruit Growers' Exchange several months ago as being based on investigations in a limited number of cities, are being systematically and thoroughly investigated now, according to Sec'y F. O. Wallschlaeger of the Citrus Protective League.

Absolutely the Best
OLIVE TREES
Grown in California

Scientifically propagated from the best fruiting trees in the State and under personal observation and supervision of a man who "knows how," thus producing trees 100 per cent perfect. You may say: "All Olive trees look alike." This may be true to a casual observer—but there's a vast difference, which will be evidenced soon after planting—more especially at fruiting time.

Armstrong trees come to bearing early

produce enormous crops of highest quality of Olives. "Safety first" in starting an Olive grove. Plant the best trees—they cost no more—perhaps less, than trees of unknown and uncertain origin and quality.
Can supply any number of trees wanted from one tree to several hundred thousand in the following varieties:

MISSION, MANZANILLO, ASCOLANO AND SEVILLANO.

Order Your

Avocado Trees

NOW --- SOON

The present demand for trees of proven varieties of Avocados is heavy and will evidently be all "sold up" early—hence it is highly advisable to make your selections and place your order at once. Should you have a favorable and suitable location for growing this wonderful and highly profitable fruit, you should have your trees planted and growing as soon as possible—**the experimental stage is passed and present growers are reaping a harvest.**

The Avocado will thrive under similar conditions as required for successful Citrus culture. **The hardier varieties, such as the Northrup, will withstand, without serious injury, 14 degrees of frost.**

NORTHRUP AVOCADO

"Taft" a thick-skinned variety

TAFT AVOCADO

Taft Avocado

A handsome, thick-skinned variety. Fruit, large, pear-shaped, weighing about one pound; flesh of extra good quality; ripens in June, July and August.

The Hardiest of its Type

The parent tree bears regularly, and is becoming more prolific each season. Can supply choice budded trees, balled or boxed at $2.00 each and up, according to size and quantity wanted.

Can also supply trees of many other proven varieties, such as

HARMAN, GANTER, NORTHRUP, CHAPPELOW, CHALLENGE, LAMBERT, LYON, MESERVE, SHARPLESS, SURPRISE, WAGNER, AND OTHERS.

at most reasonable prices.

Ask for free copy of my 1916 illustrated and descriptive catalog of Avocados and all other fruit trees of highest quality, at most reasonable prices.

Explicit instructions for planting and cultivating the Avocado supplied all customers.

Miller's Late Peach

Without a Doubt the Finest of All Late Peaches.

a yellow freestone, ripening November 1st to 15th, and commands fancy prices. Originated by John S. Armstrong and propagated solely by the Armstrong Nurseries, Ontario, Cal.

You should order a few trees of this new variety at once—

choice trees at 40c each; $3.50 per 10 and $30.00 per 100 f. o. b. Ontario.

Ask for free illustrated and descriptive catalog of 27 other varieties of Peaches, adaptable to California and the Southwest.

Write for special prices on large quantities of any sort of fruit trees wanted.

Apple, Peach, Apricot, Pear, Plum, Walnuts, Almonds, Pecans, Orange, Lemon, Grape Fruit, Limes, Tangerines, etc.

WHAT THE SUGAR BEET MAY DO FOR CALIFORNIA.

There was recently given at Oxnard, Ventura county, by the American Beet Sugar Company, a barbecue which more than 2000 people attended. After the feast Robert Oxnard of San Francisco addressed the assembly and included these paragraphs:

"It is interesting to speculate upon what the sugar producing possibilities of California would be. California, with an area of over 150,000 square miles, is as large as France. If only 3 per cent of its area were devoted to beet-sugar production, it would produce 4,000,000 tons of sugar, consumed in the entire United States. This would have a value of $400,000,000, which is equal to the whole of the present product that comes from the soil of California in the shape of field crops, orchard, live stock and forests.

"In addition to this, sugar-beet pulp would fatten 2,500,000 steers every year—one fat steer for every man, woman and child in the State. Then, another by-product, the molasses, could be turned into alcohol to give a gallon every week to every man, woman and child in the State. This might not be an unmixed blessing, but you will admit that it would make things lively. To accomplish all this, would require less than 100 factories such as you see before you now. It has been the universal experience everywhere that a beet factory doubles and trebles the value of the land around it. It also builds up prosperous communities around it that have all the advantages without the disadvantages of the great cities."

TEPARY VS. BLACKEYE BEANS.

[Written for Pacific Rural Press.]

One year's experience does not necessarily prove one crop better than another, but Ed Powers of Manteca received so much more money for his Tepary bean crop last year than he did for an equal acreage of Blackeyes that he says he'll plant Teparys after this.

Last year he planted a sack of Teparys as an experiment and when harvested they yielded five sacks to the acre more than his other beans, the sacks weighed heavier and the Teparys sold for $1.70 a sack more. Both the Blackeyes and Teparys were planted later than usual last year so neither did as well as possible, the Blackeyes running 10 sacks to the acre and the Teparys 15.

Besides the difference in yield the Teparys are an early maturing bean and if planted in May never get caught by early fall rains. Mr. Powers plants eight pounds of Blackeyes to the acre and only four of the Teparys, the latter being a smaller bean.

The University Experiment Station, located on 40 acres at Meloland, Imperial county, is emphasizing dates in their fruit planting. Already several hundred date palms are at fruiting age; and others are soon to be set about 30 feet apart among the young citrus trees which were considerably frosted in mid January. It is hoped that the shade of date palms may favorably modify the summer heat and winter frosts on the oranges.

WHAT SHOULD CALIFORNIA DO FOR BREAD.

(Continued from page 99.)

a demonstration of the fact that a fertile country with a good climate can be most highly developed in the line of special products and still make her own bread.

Third, from an agricultural point of view, wheat is an indispensable factor in the rotations which we shall observe as we farm more rationally and have more regard for the maintenance of fertility in the soil. A high-priced cereal is the collector of the money which the other factors of the rotation are storing up. Pasturage, legume-growing, deep-root growing and other factors in rotation should pay their way, and as much more as wise use of the products can get out of them, but it is the high-priced cereal which is depended upon to coin into dollars the savings of the other crops. There are two high-priced cereals, wheat and rice, and they will both do as rotation collectors, but wheat is vastly more available because of the extra water and soil handling which rice requires. Therefore wheat is indispensable in California's improved farming of the future.

Fourth, California should produce her own flour and flour for export because milling exports the least valuable part of the grain and saves to the state the part of the grain which is most valuable, to-wit: the bran and other feed-stuffs for stock which are directly required for the dairy and other branches of the live stock industry and indirectly required to increase and enrich the annual by-product in manure. From this point of view it would do perhaps to import wheat and export flour, but California's milling industry will be permanent and prosperous if it can continue to command California-grown wheat. Great mills have a natural tendency to draw near to plenty of wheat.

Fifth, California needs to hold onto wheat production because the wheat plant with us makes most growth while the water is falling and turns at once into vegetation much moisture which would otherwise be lost in run-off or fly away by evaporation. Because of our growing winter, it is possible to get the maximum results from a minimum of precipitation. Therefore the arts of better tillage, which have come to be called "dry-farming," will do more in California than in any cold-winter climate. Wheat is the best selling of the dry-farmed crops and therefore indispensable to the fullest use of our unirrigated lands. Wheat is also indispensable from the point of view of irrigated field crops for the reason that it is irrigated during the winter when water is most abundant in streams and least needed for fruit and forage crops.

Sixth, wheat growing is needed because of the inspiration and opportunity it gives to invention and manufacture. California has the most unique and capacious grain-growing and harvesting machinery in the world, the introduction of which to other countries is being profitably pursued. Though wheat growers of the future may operate on a smaller acreage per capita of ownership and do the work better and get a vastly larger acre-product, it is altogether likely that arrangements will be made to retain the advantage of tractors in tillage and hauling and harvesters in cutting and threshing. Even though they may be modified to meet new conditions which may evolve, it is too soon to prophesy that they will be displaced in the fundamental of cheap power and their efficiency as labor savers.

For these and for a number of other incidental reasons, economic and humanic, which the interested reader can develop for himself, we answer now the question propounded at the beginning and declare that "What California should do for bread" is to grow more wheat and we shall hope at another time to suggest ways by which more wheat can be profitably grown in this State.

THE PEACH-ALMOND.

To the Editor: Regarding your inquiry about the peach-almond for a stock, they don't seem to grow true to type, but have a tendency to revert back to almonds. To breed them up so they would grow true would doubtless require 8 or 10 generations of seedlings, selecting a certain type to plant each time, continuing this till the type becomes fixed, so it will reproduce true from the seed. This might require nearly a lifetime. T. J. True.

Dairymen—

HERE IS A BOOK THAT YOU OUGHT TO HAVE

Send for a Copy Now—

It contains some valuable information on feeds and feeding, together with plain, simple facts about dried beet pulp—the feed you will eventually buy. Your name and address on a postal will bring you the book free. Send for it now.

LARROWE'S DRIED BEET PULP

—is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage, with as great or greater succulence—swelling to fully six times its original bulk when moistened. It will increase your milk yield from one to five pounds per day from each cow—and at the same time improve the health of your herd.

Order a single 100-lb. sack (either plain or with molasses) from your feed dealer and test it on one cow whose milk record you know. You'll be pleasantly surprised at the results.

FREE! Our Booklet "Profitable Feeding."

It will pay you to send for and read this booklet. Do it now.

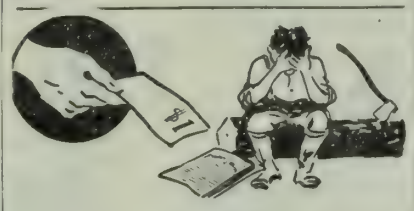
California Swine Breeders First Sale.

[Written for Pacific Rural Press.]

There is no longer any doubt but that California has "arrived" from a purebred livestock breeding standpoint and that the problem confronting the industry at the present time is, how best to distribute the "seed" on hand, so that it may do the greatest possible good.

With swine this is particularly true at the present time and while the Exposition Berkshire sale is the only co-operative attempt that has been made in the past, its success in distributing the best blood of that breed to all parts of the State, at remunerative prices to breeders, seems to have paved the way for many more sales of the same character.



Among the first to realize the advantages of this plan of selling were the members of the California Swine Breeders' Association, and their first sale at Sacramento, next week, is the result.

That the idea has met with favor among the breeders of the State, is evidenced by the fact that a total of 107 animals, representing the Berkshire, Poland China, Duroc Jersey, Chester White, Yorkshire and Hampshire breeds have been consigned, whereas it was the original intention to confine the sale to 40 head.

With the above number, many of which are from the most prominent herds in the State, the undertaking really becomes a hog show as well as a sale and together with the program that has been arranged for the annual meeting of the association, January, 26, one of the largest crowds of farmers ever in attendance at an auction sale in this State should be attracted.

Prof. J. I. Thompson, secretary of the association, sends us the following program for January 26, which will start promptly at 10 o'clock at Travelers' Hotel, Sacramento:

President A. M. Henry, presiding; Hog Cholera and Its Control, Dr. B. J. Cady, U. S. Dept. of Agriculture; The

If this farm paper doesn't make you happier, stop it and get your money back

No preaching — but nearly 1,000,000 homes are better places to live in because there's one paper that feels and voices the real needs of the farmer and his family, as well as the needs of his acres and his stock.

Have you the time to read a paper that makes you glad you live in the glorious country? Send $1 for five years; or write for free sample of Farm Journal and free copy of Poor Richard Almanac for 1916. Write today to

Hauck's
Big Type Poland China
Offering.

I am consigning to the Swine Breeders' Sale at Sacramento 3 boars and 2 sows, sired by **LONG MODEL**, a boar which weighed 600 pounds at 22 months.

This lot of boars were farrowed June 19, 1915, and are out of dams sired by Longfellow 3rd.

The gilts I offer were farrowed June 30, 1915, and are out of a dam sired by **Iowa Wonder**, a son of A. Wonder.

They all have nice heads, wide, well-arched backs, good hams, large bone, and stand up well on their toes.

Be sure and have a bid on one or all of them.

Breeding stock for sale at all times at my farm.

NATE HAUCK.
ALTON, Humboldt Co., Cal.

JACK LONDON OFFERS---

At Sacramento Sale,

A Trio of Durocs out of Glodine, a 700-pound sow, sired by Sonoma, a son of Cal. Volunteer,

and

Two Chester White boars, sired by Jose, a 700-pound boar. These two boars are ready for light service and fit to head any herd.

We also have for sale at our farm:

1 two-year-old Registered Jersey bull.

1 Yearling Reg. Jersey Bull.

Several fine grade family cows.

A few good grade work horses, 1600 to 1700 pounds.

Full particulars upon request to

JACK LONDON.

FIRST ANNUAL AUCTION SALE OF PURE BRED HOGS

Under the auspices of the California Swine Breeders' Association, will be held at the STATE FAIR GROUNDS, SACRAMENTO, JANUARY 27, 1916.

100 head of pure-bred hogs of various breeds will be sold. These represent the TOPS of some of the best herds to be found in California. All hogs sold will be registered and be guaranteed breeders by consignors.

W. H. HORD, Auctioneer — J. I. THOMPSON, Secretary

Selling Side of the Pure Bred Hog Business, C. B. Cunningham, Mills, Cal.; The Value of a Good Sow, Nate Hauck, Alton, Cal.; Judging of market barrows, to be slaughtered afterwards and exhibited the next day at the sale; The Value of a Good Sire, A. B. Humphrey, Mayhew, Cal.; 1916 State Fair, Chas. W. Paine, Secretary State Board of Agr.; The Value of a Good Pedigree, C. N. Slocum, Willows, Cal.; Fitting Hogs for the Showing Ring, J. L. Thatcher, Riverside, Cal.

As an indication of the quality to be offered in this sale, the following description of a few of those offered are of interest.

A. M. Henry, is offering four Poland China boars, all of which are of serviceable age and sired by H's Big Bone, the grand champion boar at the 1913 State Fair. Two of these boars are out of Western Winner, another out of Lady Improved and the other out of Turlock Wonder, all immense sows with good individuality, as are their sons.

C. B. Cunningham offers five bred gilts, two of which are sired by W. Earl and out of Miss Trim and W. May. These two gilts are bred to Chief Triumph. The other three are sired by Missouri Lad, who was sired by White Eagle Chief. Two are bred to Perfection Boy. The other is bred to California Prince 2nd, a boar recently purchased from the University Farm. This stock is right in blood lines and the matings should produce something nice.

Breeders will be interested in the announcement that Jack London, the author, has five entries in the sale. He is offering a trio of Durocs, out of "Gladine," a 700-lb. sow, sired by "Sonoma," a son of old "Cal. Volunteer." He also enters two Chester White boars, sired by "Jose," a 700-lb. boar. These two boars are now ready for light service, and are fit to head any herd.

The five Poland China pigs that Nate Hauck is consigning to the sale were sired by Long Model, a young boar that Geo. M. Cantrall bought in H. Fesenmeyer's 1914 sale. He is a large hog weighing over 600 pounds at 22 months old in light breeding condition.

The dams of these pigs were sired by Longfellow 3rd, a son of Longfellow Jr., and the pigs themselves are exceptionally well put up.

The Oak Grove Dairy Farm offers the two service boars, Cee Master, by Artful Masterpiece and out of Jewel Cee, farrowed March 10, 1915, in a litter of eight, and Wilts Masterpiece 2nd, another son of Artful Masterpiece and out of Belle Wilts 35th, farrowed March 28, with a litter of eight. They also offer two bred gilts, Oaks Master Belle 4th, a litter mate to Wilts Masterpiece 2nd, and equally as good an individual, now bred to Brinton's Longfellow, and Improver Lady Value 4th, sired by Improver B, farrowed November 11, 1914, with a litter of eight. She was bred to Brinton's Longfellow November 20, 1915. Her dam was Woodland Lady Premier, one of the company's old standbys.

L. D. Collins is offering five bred Duroc gilts, all sired by Slocum Crimson Wonder, sire of Chief Defender and litter mates of Red Wonder of Cal., Prince Collin, California and Senorita. They are all bred to Model Chief, a young boar of great vigor and promise.

A. H. Brinton has two Berkshire sows in the sale sired by grand champion Baron Duke 170th, one of which is out of Victor Belle 15th.

L. R. Painter is consigning the Poland China boar Snyder Hadley, a proven breeder carrying some of the best blood of the breed in Missouri.

Mrs. Nettie Douglass has two Poland China boars in the sale, one, Lucifer by Skidmore, 11 months old, and the other Roy Boy, litter mates.

W. H. Hord of 704 Market St., San Francisco, will do the auctioneering

SPOON-FED FARMING DEPLORED.

To the Editor: A simple amendment to the Reserve bank law would solve, as far as government can do so, the rural credit problem. Let the reserve banks be authorized to receive from auxiliary banks, as security, long time farm mortgages at 4 per cent. This would remove the offensive features of other propositions which treat the farmer as a servile dependent upon government favor. It would place his securities on a par with those offered by men in other kinds of business.

The proposition of Mr. Weinstock that farm produce shall be officially handled, routed, shipped, stored and sold, is one that also treats the farmer as a poor dependent creature incapable of attending to his own business. It has been shown here that producers are entirely capable of co-operating in shipping, routing and selling, and all classes of rural producers should be encouraged to follow this example rather than to use Abraham's bosom for a pillow and let the most important part of their business be attended to by one of many political machines.

I think Mr. Weinstock would be insulted if the farmers should propose a state commission to take official charge of his business, and sell, distribute and route the sale of his bright ribbons, modern hip and straight front corsets, laces, underwear and things.

In these high and mighty days of reform the chemically-pure politician is becoming a greater pest by far than the old common garden variety he has displaced. He does not seem to know that experience is still teaching school, and that the more government does for a people the less they will do for themselves, until individual initiative becomes a lost quality. Jno. P. Irish.

Oakland.

LARGE TYPE POLAND CHINAS

AT

SACRAMENTO, JANUARY 27.

We have consigned to the

California Swine Breeders' First Annual Auction Sale,

WESTERN PRINCE 245,319, sired by H's Big Bone and out of Western Winner, farrowed March 27, 1915.
BIG WONDER 245,323, sired by H's Big Bone and out of Lady Improved, farrowed April 25, 1915.
BIG BONE JR., 245,317, sired by H's Big Bone and out of Western Winner, farrowed March 27, 1915.
CHIEF THICKST 245,321, sired by H's Big Bone and out of Turlock Wonder, farrowed November 26, 1914.

These boars are all sired by **H'S BIG BONE, the half-ton Grand Champion** at **California State Fair 1913,** and are out of our immense sows.

Each one is a good individual and will suit the particular buyer. Be sure and see this lot before the sale starts.

We also have several young litters by **H's Big Bone** and **Dude,** not included in this sale, which we shall be pleased to send you full descriptions of; or, better still, come and see the herd and be convinced of its excellence.

More and Better Hogs in California.

Turning off six-month-old pigs by the carload, weighing an average of 190 pounds each, is made possib le by breeding and feeding.

GETTING HOGS TO MARKET EARLY.

[Written for Pacific Rural Press.]

Get a hog to market early if you want to make the most money out of him, is becoming more and more of a slogan among progressive hog growers in California.

What is possible in this respect is pretty well demonstrated on the 30-acre alfalfa ranch two miles from Modesto managed by B. E. King. About 350 head of hogs, little and big, are handled on these 30 acres; and it is a rule strictly adhered to not to keep a market hog over 8 months of age. Naturally this is made possible only by breeding and feeding.

The brood sows, of which there are 50 (to be increased, however, to 75 at once), are selected from the young gilts and are later mated with purebred Berkshire boars. This system of selection and mating naturally serves as a foundation for fast growth when feeding conditions are right.

An Inyo County Berkshire, owned by J. L. Gish.

The brood sows, both before and after farrowing, are not turned onto alfalfa pasture as the other hogs are; but are fed alfalfa hay, rice middlings, and some buttermilk at times. It is after weaning that the heavy putting-on of weight is done on this ranch, the hogs immediately after weaning being turned onto 20 acres of sub-irrigated alfalfa, securing a ration of alfalfa pasture, buttermilk, ground barley, and rice middlings till they weigh about 90 pounds. They are then put onto a concrete feeding floor and fed all of the buttermilk and grain ration they will eat.

The pens are provided with self-feeders in which ground barley and rice middlings are always before them together with charcoal, salt, and other health food. Mr. King estimates that the hogs in the feed pens consume on the average about four gallons of buttermilk daily which is secured at ¾c a gallon, and about three pounds of the grain mixture.

The value of this ration in securing gains is demonstrated by the average gains made in two pens between Aug. 9 and 27. Each of these pens in the beginning contained 20 head, and the average gain per day per head was 2¼ pounds in one pen and 2.47 pounds in the other. These hogs were marketed at six months of age in San Francisco and weighed 178 pounds after shrinking 12 pounds each from their 14-hour rail trip.

Convenient Feeding.—In feeding such a large number of hogs on such a small acreage, it is natural that convenient and sanitary quarters must be provided. Two feeding sheds have been built, each being 26 feet wide and 100 feet long, divided into five compartments, each 20 feet wide and 26 feet deep. Along the front of this building a concrete floor and skim milk trough extend 9 feet from the edge of the building. Next to this is a concrete wallow which drains into a gutter and is easily cleaned out. A wooden bridge connects the concrete feeding floor with a board-floored pen back of the wallow. This latter pen is protected by a roof and has hinged doors on both back and front, which may be closed in winter and opened in summer. This provides excellent sleeping quarters for the hogs in either wet, cool weather or exceedingly warm weather. A gate connects these sleeping quarters with a five-foot passageway running along the outer edge of the building, which is also floored with lumber. At one end of this passageway is a loading chute; and at the other end is a corral and dipping vat. Each of these houses accommodates 100 hogs and is kept in sanitary condition by the daily scrubbing of floors, wallows, and feeding troughs.

The farrowing house is built on similar lines, the pens in this instance being but 10 feet wide, thus making the sleeping quarters 8x10 feet deep. This building is floored with lumber in place of concrete, as that has been found better for the young pigs.

Watches for Cholera.—Cholera is considered the only objectionable feature of raising hogs in this manner, as once it gains a foothold it is difficult to stamp out. It was brought onto the place last year by the purchase of shoats from another county, which had cholera in a chronic form and did not show symptoms until heavy feeding was commenced. Since that time, all the hogs have been vaccinated, and from now on it is the intention to finish only those hogs which have been grown on the ranch, immunizing the brood sows and keeping a liberal supply of serum on hand in case any outbreaks should occur.

Mr. King emphasizes the point that when hogs are properly fed they can be easily brought up to suitable market size at six to eight months with less expense than when kept improperly for longer periods.

MR. HOG ON DIVERSIFIED FARMS

There are advantages to diversified farming and by no means the least of these is the opportunity afforded for swine raising.

A highly diversified ranch was recently visited on which Mr. Hog was shifted around like this: First he learned to eat at the dairy, where he had skim milk from the dairy and the run of a small patch of alfalfa. After weaning he was sent into the orchards, picking up waste fruit here and there which was sandwiched in with almonds that had been knocked from the trees by birds. Incidentally he helped himself to ripe olives, the result of early frosts, and cleaned up the unpicked grapes in a nearby vineyard. Most of the time he was "fruiting" he had access to the alfalfa pasture.

This series of feeds carried him well into the fall of the year and had developed him into a good-sized feeder, ready for grain finishing. Although not previously planned that way, it happened that just then there was a 16-acre field of sorghum and Indian corn harvested, where Mr. Hog and 49 of his relatives found enough waste grain on the ground and stalks to finish himself up in tiptop shape. This and an alfalfa pasture was his last feeding ground.

If variety is the spice of life California hogs on diversified farms surely ought to have plenty of life.

For the third time, J. D. Lott of Holtville is raising hogs. The first bunch died with cholera; the second bunch, purebreds, were vaccinated with old serum and died; the third bunch of about 200 are being vaccinated with satisfactory serum; 70 were vaccinated last week.

FIRST SEMI-ANNUAL SALE

OF

Kings County Poland China Breeders' Association

will be held at

The Fair Grounds, Hanford, Calif.

Saturday, Feb. 5th, 1916.

On this date there will be one hundred and fifty head of Registered Poland Chinas sold, consisting of

Bred Sows, Bred and Open Gilts

and a number of High Class Boars

Some of the best animals from the leading herds of Kings County will be sold without regard to price or value.
This sale will be absolute AND WITHOUT RESERVE.
No protection measures of any kind will be permitted.
Sale under cover and will be held, rain or shine.

CONSIGNORS:

M. Bassett
Wm. Bernstein
J. A. Crawshaw
Oscar Dimmick
T. J. Gilkerson
J. D. Ross
Geo. A. Smith
W. D. Trewhitt

AUCTIONEER:

COL. BEN A. RHOADES,
Assisted by T. J. GILKERSON.

or any consignor, Hanford, Cal.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

J. S. Gibson Co., Box 97 Williams, Cal.

FOR SALE, SINGLE OR CARLOAD LOTS

KING LANCASTER,

Son of King Edward, Grand Champion Bull California State Fair 1909, 1910, 1911. The only Bull 3 times Grand Champion at State Fair.

My range-raised bulls this year are the finest lot I have ever had.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

Advantages of Heavy Horses.

[By Wayne Dinsmore, Secretary Percheron Society of America.]

The advantages draft horses have over light horses in farm work are numerous. The tractive power horses can exert is governed by weight, strength and temperament. Under extraordinary pressure horses can exert from four to six horse power, but under conditions of daily work exert a pull which is about one-tenth of their working weight.

The horse power traction required to move farm implements depends on the soil, climatic conditions, and the condition of implements used. Under favorable conditions five draft horses weighing 1600 pounds or over will pull a two-plow gang of 14-inch plows a little more than twenty miles, averaging from five to five and a half acres per day. It will take seven horses that weigh from 1100 to 1300 pounds to do the same work, and it is not practicable to work seven horses on one gang plow with the ordinary class of farm labor. It will therefore require two men on single plows, one with four and the other with three light horses, to do the same amount of work that one man will do with five draft horses.

The same general ruling applies in seeding, disking and harvesting, for while one man can readily handle five draft horses on the implements needed, he cannot advantageously nor safely use enough more light horses to give his equivalent power. The use of draft horses therefore increases the amount of work one man can do in the field; and in actual practice the work is better done when drafters are used. When to this we add the fact that less barn room is needed, and less labor required in handling the heavy horses, than is necessary where enough more light horses are used to make up equivalent power, the advantage becomes marked.

Besides this, the heavy horses sell more readily and at higher prices, when surplus is to be sold. Light weight horses have been bought at prices ranging from $110 to $150, while draft horses have brought from $200 to $300 each. This is an important factor, for every well managed farm has a few surplus horses to sell annually, and the readier sale, and higher prices realized for draft stock, are factors which must appeal strongly to all thinking farmers. Maximum cash returns are what we are all interested in, and this we obtain from drafters used in farm work.

Dairy Production for 1914-15.

[Written for Pacific Rural Press.]

Dairying fattened farmers' pocketbooks to the tune of $38,377,342 during the year ending September 30, 1915, according to a report just issued by Secretary Andreason of the State Dairy Bureau. The fact that this is almost four and a half million dollars more than was received by farmers from this source in the year ending September 30, 1914, indicates that dairying is having a healthy growth in the State.

The figures given below show that the greatest gain in the various branches of the industry were made with butter. Other figures in the report show that the average price of butter during the year was $.2870 as compared to $.2761 the year previous. Cheese prices, however, did not fare so well, the average the past year being $.1410 as against $.1606 the year before.

By counties Stanislaus continues to beat out her nearest rival in butter production by a goodly margin, with Imperial second and Humboldt third. The accompanying figures show how the different counties favor the dairy cow.

County	1914	1915
Alameda	316,912	437,401
Alpine	25,000	27,000
Amador	140,000	114,890

PEROXIDE NOT GOOD FOR RABBIT EAR SCABS.

[Written for Pacific Rural Press.]

Use of peroxide for rabbit ear scabs failed for Mrs. Oakes of Contra Costa county, whose beneficial results as reported in Pacific Rural Press proved to be only temporary. She and one of her neighbors succeeded beautifully, however, by applying olive oil, mixed with sulphur to a gravy-like consistency. This was applied directly to and around the scabs with the tip of a feather. The worst cases required daily treatments for a week; and one of them was later found uncured. A few treatments of the same kind, however, fixed this case. Mrs. Oakes reports that a medical friend says use of peroxide seems often simply to drive the germs farther in rather than killing them. This was the case in one of our recent veterinary queries.

COW WITH THROAT TROUBLE.

To the Editor: Have a cow that stands around with her tongue out and tries to cough and never chews her cud. She filled up on corn fodder about six weeks ago, and I gave her cow tonic which seemed to relieve the bowels. One of my neighbors says she has lost her cud. Can you tell me what to do for her?—H. M. B., Turlock.

[Examine her throat and see if anything is caught there, then give her two pounds of Epsom salts and one ounce powdered ginger at one dose. Follow this with one dram fluid extract nux vomica twice a day until she is relieved. If the salts do not act on her bowels in 24 hours repeat the dose of salts.]

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

RE MO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

Redwood Manufacturers Co.
1608 HOBART BLDG., SAN FRANCISCO.

DAIRYING.

Mr. R. Fisher of Ripon, San Joaquin county, is increasing his dairy herd by outside purchases and is building a large modern dairy barn.

C. R. Merrill of Colusa has purchased the dairy of A. M. Hampton which he will overhaul and put in shape for sweet milk production.

R. D. Stitt of Holtville has already disposed of three or four poor producing cows after only six months of recording milk weights of individual cows.

J. M. Reardon of Bieber, Lassen county, has been looking over the dairy field in the vicinity of Chico and is considering the erection of a cheese factory at that place.

American condensed milk is being exported in record-breaking amounts with sales aggregating 37,235,627 pounds in the fiscal year 1915, against less than one-third that amount in 1911.

Garclaugh May Mischief, an Ayrshire cow belonging to P. Roberts Jr. of Pennsylvania, has just finished a year's record with 25,328.7 pounds of milk containing 1052.83 pounds of butter.

Some 350 separate separator houses have been built in Imperial county the past year. This has been a great factor in the increased quality of cream and butter, according to Dairy Inspector H. T. Nye.

J. D. Huston of Imperial is putting in extensive improvements such as concrete floors in the dairy barn, two big silos, and a small cold storage plant for cream to be shipped for a high price to Los Angeles.

Cheese production in Imperial county decreased to 61,000 pounds in 1915 from 185,000 pounds in 1914; while butter production increased to 6,334,316 pounds in 1915 from 5,710,287 pounds in 1914.

Dairy Inspector H. T. Nye of Imperial Valley believes it is best not to pasture cows but to cut green feed for them daily. It saves them exercise in the hot season and gets more feed per acre. R. D. Stitt is one who does this.

E. A. Clausen of San Francisco reports the sale of a registered Holstein bull calf to J. M. Cremin of Sacramento. This bull was sired by Artis Pontiac Butter Boy and out of a young cow not yet tested whose sire was Maplecrest Korndyke Pontiac.

Dr. E. J. Weldon returned from the east last week with 112 registered Holsteins which he purchased in the east, 80 of which were for the J. M. Henderson company of Sacramento county. Dr. Weldon will keep the other 32 head on his ranch near Galt.

An interesting program was prepared for the annual meeting of the Humboldt County Dairymen's Ass'n which was held at Ferndale January 12. F. J. Cummings was elected president to succeed H. A. Perry who has served in that capacity for three and a half years.

The California Polytechnic school at San Luis Obispo will soon begin to make cheese. A cheese maker from Denmark was engaged after he had made a special study of the business at Tillamook, Wash., according to E. L. Westover, who has charge of the dairying at that school.

Mr. A. Gregory of Redlands has purchased 515 acres of land between Redlands and San Bernardino which makes his total holdings about 650 acres. Mr. Gregory plans to plant this acreage to alfalfa and increase the size of his dairy. He is also contemplating the erection of a cheese factory.

According to the monthly report of B. F. Kegel, tester for the Stanislaus County Cow Testing association, there were 85 cows in that association which produced over one and a half pounds of fat during the month of December. The heaviest producer during the month was the Holstein cow Abbie, owned by N. E. Cornwell, who gave 82.4 pounds of fat.

Men in charge of 43 cow testing associations in Wisconsin who have found the Babcock test the biggest single asset to their business success as breeders and producers of profitable dairy cattle will hold a conference in Madison during the Wisconsin Farm and Home Week, Feb. 7-12, which is the twenty-fifth anniversary of the butter fat test by Prof. S. M. Babcock.

The N. H. Locke Co. write: "We have recently sold A. B. Kendall, Manchester, Midget's Valet of L., sired by King's Valet and out of Lady of Lockeford's Midget, who gave 61.6 pounds of fat in one month and 52.29 pounds fat in the seventh month of her lactation period. Also the bull Lodeman's King of L., grandson of Valet's Golden Biddy and Borello's Golden Laddie.

The high character of the public sales of Guernseys is worthy of commendation. The demand for Guernseys at private sale has been so tremendous for the last few years that there have been very few sales of Guernseys from the commission or dealer's standpoint. This has been so marked that the Fasig-Tipton Company, Madison Square Garden, New York, found it impossible to secure Guernsey consignments to their recent sale.

A report from Modesto says that the Western Securities Co. of Los Angeles have buyers in Stanislaus county with orders to purchase 1500 head of dairy cows for settlers in Milford Valley, Utah. An effort is being made to secure grade Holstein cows, which will be bred to purebred bulls that the company expects to purchase in Wisconsin. We can see no reason why progressive Holstein breeders in this State should not get some of this bull trade.

SWINE.

A pig raising club will be organized in the Chico high school sometime this month.

Willoughby & Sons of Calexico are gradually working over their large herd into purebred Durocs.

Another carload of hogs was shipped from Los Molinos last week to the San Francisco market.

Ralph Bull of Arcata, Humboldt county, purchased a carload of hogs at Ukiah last week for shipment north.

A pig club was organized at Tulare early this month through the efforts of R. R. Ingell of the U. S. Department of Agriculture.

Mr. Forest of Holtville lost 30 hogs by cholera, and bought some more which were vaccinated in mid January by the double treatment.

An outbreak of hog cholera is reported from Yerrington, Nevada. A representative of the Nevada University is on the ground aiding the farmers in eradicating the disease.

Hog shipments from Yuba City this year have been heavy. Henry Chism and H. A. Walton shipped a carload from that place last week and expect to make other shipments soon.

Hog shipments from King City, Monterey county, have been heavy so far this month and the stock going to market are said to be in exceptionally fine condition, bringing around 5½ cents a pound, delivered at cars.

Peters and Lamson of Imperial county, being so far removed from the rest of the State, have established a sample sales herd near San Bernardino, while still raising their stock under the favorable conditions of the old ranch. Most of their sales have been in Imperial Valley.

Dr. R. W. Ritter has recently vaccinated hogs for the following people about Holtville: 600 registered Durocs for Peters & Lamson, 450 Poland Chinas for Mr. Scott on the Davis ranch, 300 for Frank Powell, 250 for W. A. Thompson, 225 for Harry Cooper, and 85 for La Costa Bros.

Peters and Lamson of Holtville recently bought the registered Duroc boar Colonel the King from Lyons Bros. of Neb. for $150 besides $21 express from San Francisco. He is a grandson of Old Missouri Top Model and of King the Colonel, which was the sire of the $5,000 boar Old Defender.

Carruthers Farms has sold this month, to Miller & Lux, six Berkshire sows and a boar, to go to their farms at Dos Palos. To R. E. Sheldon of San Francisco, three yearling Berkshire sows. Mr. Sheldon offered Mr. Carruthers $500 for his Berkshire boar, Ames Rival 70th, but failed to get him. H. H. Hewings, Calistoga, purchased Forest Grove Duchess 5th, one of the winning sows at the Panama-Pacific; he also bought three of the best yearling sows on the ranch for a show herd to be exhibited this year.

BEEF CATTLE.

The Spreckels company shipped 200 cattle from Kings City last week to Oakland. These were beet pulp cattle and the company still have 1590 head in their corrals.

Word comes form Chicago that a new breed magazine to be known as the Shorthorn World will shortly begin publication under the editorship of James H. S. Johnstone.

The ranges of Nevada will be seeded with Australian grass under the supervision of the Nevada University. That grass has been found to be particularly adapted to Nevada conditions.

A report from Santa Barbara states that there are more beef cattle on the coast ranges this year than for many years past and that the grass is, generally speaking, in excellent condition.

V. F. Dolcini, who has been a professor at the University Farm at Davis for the past two or three years, has leased the Jones ranch of 100 acres near Davis where he will establish herds of purebred stock.

What are said to have been one of the finest lot of beef cattle ever turned out in the Salinas valley were the two carloads shipped by Miller and Lux one day last week from their beet pulp feeding station at Alisal.

Within the next two months specialists on range grasses will make trips to Humboldt county to talk to the cattle men there on the various range grasses and the possibility of introducing better varieties into that county.

The Secretary of Agriculture has authorized for the season of 1916 the grazing of the number and class of live stock on the El Dorado National Forest as follows: 9700 cattle, 50 swine, 17,500 sheep, 400 horses and 1500 goats.

Cattle owners from Nevada are working in connection with the Oakland and Antioch railroad in an effort to secure a round trip livestock rate from Nevada to California points. The Nevada cattle raisers are desirous of wintering their cattle in the Montezuma Hills of Solano county.

W. T. Sesnon of San Francisco has received from the east a carload of registered Hereford heifers, very strong in Anxiety blood. To head this herd he has also received a $1000 bull calf from the celebrated herd of Harris & Sons of Missouri. The stock will be placed on Mr. Sesnon's ranch near Aptos.

Live stock men in Napa county met last week at St. Helena to perfect the organization of the Napa County Livestock Ass'n, whose purposes are set forth as favoring and aiding in every possible way the advancement of purebred livestock in the county. Homer Hewins of Maplewoode was elected president of the new organization.

W. M. Carruthers will receive this week six cars of fine stock from Iowa, consisting of 50 head of serviceable Hereford and Shorthorn bulls, and 50 head of Shorthorn and Hereford heifers. The Shorthorns are made up of Scotch ancestry, and while they were purchased last March it was not till now that they could be shipped out here.

Elko county, Nevada, has a staghound which is doing the work of several men in the etxermination of rabid coyotes. The hound is owned by Asa Womach, a rancher in the northern part of the county. Womach has brought to Elko the scalps of 100 coyotes, nearly all of which had been run down and killed by the dog, which has been trained for the work.

Lima bean straw is half the price of alfalfa ($15 to $16) at Goleta according to J. G. Williams; and it is not worth more than that proportion in feed value. Mr. Williams fattens beef for himself on lima bean straw, principally, but it is a slow process. He gives it to his dairy cows with grass, pumpkins, beets and alfalfa. They clean it up well after being accustomed to it.

A total of 7650 horses, 3200 head of cattle, and 300 hogs, may be

PEDIGREED HOLSTEIN BULL $250.

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. Her present record is 21.09, made at four years old, but she can make around 25 lbs. with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service.

Write or come and see him.
F. H. STENZEL,
San Lorenzo, Calif.

Carruthers Farms

are now offering for sale

50 Head of Shorthorn and Hereford Bulls

Serviceable, tuberculin tested, registered.

50 Head of Shorthorn and Hereford Heifers.

Tuberculin tested, registered.

These bulls and heifers are a remarkable lot, the Shorthorns being nearly all Scotch breeding.

For particulars and prices address

W. M. Carruthers
515 Hearst Bldg.,
San Francisco.

E. K. Brown
Superintendent.
Mayfield, Cal.

grazed in the Santa Barbara forest this season, according to word received from the United States Department of Agriculture by Forest Supervisor J. R. Hall. The grazing season commences in March and lasts until November. The fee for pasture is about 64 cents for the season for cattle and 80 cents for horses.

The University of California has purchased the Shorthorn bull Sultan Mayflower, from the Whitehall Estates, Inc., at Tracy. This bull is sired by Sultan Stamp and from an imported cow of Scotch breeding. As a calf Sultan Mayflower was selected by Leslie Smith of the firm of White and Smith, owners of the great show bull, Ringmaster, to share herd duties with the older bull, but was later secured by the Whitehall Estates Co. when the herd was dispersed.

W. M. Carruthers received this week from Rookwood Stock Farm, Ames, Iowa, the fine young Shorthorn bull Count Glory, sired by Count Avon, an International grand champion, and four yearling heifers also sired by Count Avon and out of Cruickshank cows, which he has placed on Carruthers farms near Palo Alto. Another lot of two Cruickshank-Lovelace and three Victoria cows will soon arrive to join the above stock. Mr. Carruthers' ambition is to build up the strongest Shorthorn herd in the west.

HORSES.

A carload of heavy horses was shipped to Los Angeles last week from Bishop, Inyo county. They were bought for the city trade.

The Hickman Estate sold 26 head of mules last week to W. W. Chandler of Holts for $2600. Mr. Chandler will use them for land checking.

Churchill and Doyle, who have been extensive buyers of army horses in this State recently, have returned to Stockton where they are again buying horses and mules.

DRAFT HORSE SALE POSTPONED.

At the meeting of the directors of the California Draft Horse Breeders' Ass'n, January 17, it was decided to postpone the sale at Davis, early in February, till some time in the fall, probably in October. This will allow more time for the securing of consignments and the proper advertising of the sale.

SHEEP AND GOATS.

C. H. Widemann of Gonzales, who proposes to establish a goat dairy, has just received three carloads of Anglo-Nubian and Toggenberg goats from Mexico. He also has another shipment of 500 goats on the way north.

In his annual address to the National Wool Growers' Ass'n, at Salt Lake City last week President Frank J. Hagenbarth of the association said that unless something is done to prevent what he pronounces unwise distribution of the public domain, the sheep industry will be destroyed.

The production of wool in the United States in 1915 is estimated by the Bureau of Crop Estimates, Department of Agriculture, as 288,777,000 pounds, compared with 290,192,000 in 1914 and 296,175,000 in 1913. The price to producers for unwashed wool has averaged about 23.4 cents per pound, as compared with 18.4 cents in 1914 and 15.7 cents in 1913.

During 1915, Petaluma shipped 2,248,801 dozen eggs more than during the year 1914.

LIVESTOCK DIRECTORY.

DAIRY CATTLE.

REGISTERED HOLSTEIN SERVICE BULLS—Ages 4 to 5 years. From excellent families. Prices on application. Miller & Lux, Colony Farm, Dos Palos, Cal.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good bams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practical and profitable—the kind that are highly satisfactory Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD of registered O. I. C. Swine. Pigs of both sexes from March, April, May and June farrows. Four sires used: Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. All the dams are the smooth, big type. A few bred sows to offer. Everything is cholera immune. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

YOUNG'S POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Advancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

RANCHO RUBIUS HERD DUROCS—Won 1st under six months, Junior Champion, Reserve Grand Champion, Champion Sow bred by Exhibitor, 2nd Sow under 2 years, and two other premiums, all on four entries at P. P. I. E. A few service boars and weanling pigs for sale. Elmer Lamb, Ceres, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915, I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind. I don't have to auction them off. John P. Daggs for prices, Modesto, Cal.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

WHEN TO DEHORN.

To the Editor: I have one cow that will freshen January 15 and two others that will freshen March 15. When will be the best time to dehorn them?—Subscriber, Escalon.

[Any time after they freshen, before the fly season comes on and when the weather is not frosty and wet.]

GROWTH ON HORSE'S LEG.

To the Editor: My horse has a growth on his hind leg, below the hock joint. It is about the size of a medium-sized orange, apparently in sections, and similar in appearance to a large wart except that it is red and full of blood. Advise me of treatment.—E. L. D., Linden.

[This is "proud flesh." Paint once a day with butter of antimony until it disappears.]

LAMPERS IN HORSES.

To the Editor: Is there a simple or effective remedy for lampers in young horses?—P. A., Lodi.

[There is no such thing as "lampers." If an animal is teething it will naturally have a sore mouth and gums. If these organs become very much inflamed rinse out the mouth with a saturated solution of potassium chlorate once or twice daily, or as needed.]

MAY BE TUBERCULOSIS.

To the Editor: We have a cow that takes spells grunting for three or four days at a time. During those spells she just lies around most of the time. She eats well and chews her cud at such times. She will be fresh in four and a half months. Should we use her milk?—H. L. W., Laton.

[Have this cow tested for tuberculosis. If she does not react give her a good purge, two pounds of Epsom salts, whenever these spells come on.]

WARBLES ON BACK.

To the Editor: Have a cow that has small lumps on her back. A few have opened and a little matter or pus ran out. What is the trouble and how should we treat it?—W. M. J., Earlimart.

[These lumps are caused by the grub of the hypoderma lineata or warble fly. They remain buried under the skin during the winter and emerge in the spring. The lumps may be opened and a few drops of turpentine placed in the cavity.]

MARE WITH THRUSH.

To the Editor: I have a mare that is troubled with the frogs of her front feet. She walks very carefully and limps somewhat. When I clean the dirt from around the frog there is a very offensive odor as from decay and the frog seems to be of a dark color underneath. Is it better to keep her shod or barefooted and what else can I do?—F. E. W., Lake county.

[This is thrush. Clean out the foul deposit thoroughly with a piece of cloth and a small stick, then pack the openings with cerate of cantharides. Repeat this treatment in four days and again in a like time. This should remedy the trouble.]

TICKS AND EYE TROUBLE.

To the Editor: Have a mare that got something in her eye. Matter ran from it for about two weeks, then seemed to be all right, but a thin blue scum has come over the eye and she seems to be blind. What can I do for her? Also, how can I keep ticks off from horses that are running out in brush land?—R. S. P., Plymouth.

[Have the following put up: Ointment of yellow oxide of mercury 2 per cent. Place a piece the size of a pea in the eye once a day until the eye clears up. Lime-sulphur dip will kill the ticks on the animals, but there is nothing you can use that with one application will keep the ticks off.]

SWEENY AND SICK PIGS.

To the Editor: I have some pigs which eat but don't grow. Their eyes get watery and some go blind. Small lumps form under their legs and some have blisters on them. Some get mangy. Please advise me what to do for them. Is there any cure for hip sweeny and stifle in horses? If so, what is it?—W. J. P., Lindsay.

[This is Necrobaciliosis. Dip these pigs in a 2 per cent solution of liquor cresolis compositus daily for four or five days, then once a week for four or five times more.

There are cures for hip sweeny and stifle trouble, but a more careful history will have to be given before treatment can be advised.]

GARGET AND LUMP JAW.

To the Editor: About a year ago I lanced the jaw of one of my cows and it never seemed to heal over, although she keeps in good condition and raised two calves for me last year. Is her milk fit for human consumption? Have another cow whose milk contains lumps resembling cream or butter. What is it and is her milk all right?—J. R. R., Folsom.

[Have both your cows tested for tuberculosis. If they do not react give the cow with the lump jaw one dram Calcium Iodide twice a day for a period of four to six weeks and paint the lump with tincture of iodine every other day during this time. The other cow has garget; give her two drams potassium iodide twice a day for two weeks or until the trouble is relieved. The writer as it is not fit for human use the milk from either of these animals as it is not fit for human use.]

HEAVES AND TEAT TROUBLE.

To the Editor: My mare colt has the scours and gas as soon as I begin feeding her oat hay and alfalfa. She keeps up well in flesh and seems all right when on the range. She breathes with difficulty after running. A hard lump about the size of an egg came on the teat of my cow last year about a month after she freshened. She will be fresh in February. Will the same growth appear and how should I treat it?—Subscriber, Redding.

[Your colt has heaves. Give her ½ oz. Fowler's Solution, three times a day, moisten the feed to hold down all dust, and reduce the bulk of her ration by giving more grain and less hay. This will slowly alleviate her trouble, but if you neglect to keep up this treatment it will come back. The medicine is to be given for two months, then skipped a month, and so on indefinitely. Try painting the lump on the teat with tincture of iodine daily until the skin becomes roughened, then skip a day or so and begin again up to the time she freshens. If this does not reduce it an operation will be necessary.]

NOTICE!

Wishing to devote my whole time to other business, I have decided to sell out my

Shire Stallions at Cost

in order to dispose of them quickly. Included are the stallions which have been at the head of my stud for the last two seasons. All are sound and good stock horses.

I can also spare one pair of "in foal" mares and three stallion foals.

If you are in the market, do not miss this opportunity.

Farm Feeding Problems.

[Answered by Prof. F. W. Woll, University Farm, Davis.]

GRAIN FEEDS FOR DAIRY COWS.

To the Editor: When beet pulp can be had for $23 per ton, alfalfa meal at $19.50 per ton, cocoanut meal at $26.50 per ton, with barley grain grown on the place, would it seem advisable to put up a silo? (Above feeds do not contain molasses.) Do those feeds make an ideal ration and in what proportion should they be fed to dairy cows? Oat hay ad lib. — H. F., San Luis Obispo.

[A silo will prove a good investment on dairy and stock farms almost anywhere in the state, because it enables farmers to secure palatable succulent feed of uniform quality and available for feeding at any time during the year. If this were not the case silos would not go up in increasing numbers every year all over the State, from the Imperial to the extreme northern counties. If the correspondent can grow either Indian corn or sorghum varieties, these will prove most valuable silage crops, but the first and the last crop of alfalfa, as well as green oats and other cereal crops, can also be made into good silage. If alfalfa is raised on the ranch, a mixture of beet pulp, barley and cocoanut meal will prove cheapest at the prices given and will make a good grain ration. If alfalfa is not available it will be advisable to include alfalfa meal in the mixture provided alfalfa hay cannot be bought at much lower price. The cows have plenty of time to do their own grinding and there is no advantage in feeding high-priced alfalfa meal to them, whatever its value may be for poultry or swine. If alfalfa hay cannot be obtained at a fair cost, say $12.00 or less per ton, and oat hay is fed, a small amount of alfalfa meal may be added to the grain mixture, making it up as follows: Barley, beet pulp, cocoanut meal and alfalfa meal, in the proportion of 2:2:1:1 by weight. About a pound of this mixture for every 5 pounds of milk produced will prove sufficient for good milch cows. Young stock and fresh milkers may be fed somewhat more grain to advantage.]

FETERITA STALKS FOR STOCK FEEDING.

To the Editor: There has been considerable experimenting in this district with feterita, but several things relative to its raising do not seem to be known. The food value of the dried stalks after harvesting; could they be shredded or cut and fed the cows with a beneficial result? I know that green, cows, horses and hogs have great preference for it over nearly any other forage. Also if feterita is planted by the first of February and cultivated, could it be raised without irrigation? Our soil is a light, sandy loam. How often should it be cultivated?—G. L. H., Winton.

[Feterita stalks make a very acceptable rough feed for farm animals. They do not differ greatly in composition from Indian corn stalks and contain approximately a similar proportion of digestible nutrients as these. They are preferably run through a shredder, or an ordinary corn cutter with shredder blades, and may be stacked and fed to cattle, horses, sheep, etc., during the fall and winter months. The shredded stalks also make a good material for bedding. There would probably be danger of injury from frost if feterita were planted as early as the first of February. Large areas of it are grown in this and other western states without any irrigation, the fields being cultivated two or three times during the season so as to keep down weeds and utilize the moisture in the ground so far as possible for crop production.]

HOG FEEDING QUESTIONS.

To the Editor: What is the comparative feeding value of bran and rolled wheat for hogs? What age of hogs would you feed either? When and how would you consider middlings? Might a heavy grain ration mixed as follows: rolled barley 1 pound, rolled wheat 3 pounds, bran 1 pound, fed dry three times a day, with all the skim milk they can drink, free range but not much green feed and all the alfalfa hay they want, be apt to give big heavy two to three month old pigs the scours? How would you feed the hulls and large particles of corn that is taken from ground corn when the corn meal is sifted out? What difference would there be between it and the whole corn? Do you consider it better to grind corn on cob for any age hogs? Do you realize more from the corn that way?—R. E. S., Bishop.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

Bran is not a satisfactory feed for hogs except in a limited way. If some bulky material is needed, alfalfa hay, alfalfa meal, roots or some similar cheap, bulky, home-grown material would be more suitable for part of the ration for brood sows or shoats not fed for gain. Wheat is usually too high in price to feed hogs, but has a feeding value somewhat superior to that of barley. When used it should preferably be rolled or ground and soaked. It may be fed to all sizes and ages of growing pigs, and in reasonable quantities to brood sows. Since it is low in protein it should be supplemented by some high-protein feed such as tankage, skim milk, cocoanut meal, etc. Middlings are much higher in protein than wheat, hence may constitute about one-third of the grain ration for growing pigs and brood sows when the price will permit.

The ration which you give, provided the bran is omitted, should not produce scours provided the milk is fed in the proportion of 3 or 4 pounds to 1 pound of grain and provided the pigs are brought up gradually to full feed.

The bran and screenings from corn meal had probably best be fed in thin slop. The greater the amount of bran and hulls found in this feed the lower would be the feeding value, for most of the indigestible crude fiber of the corn would be found in these screenings.

Would prefer to feed ear corn dry and on the cob to hogs. Corn and cob meal is satisfactory for cattle and sheep but too bulky for use in pork production. Unless the corn is exceptionally dry it can be most economically fed on the cob where a clean feeding floor is available. For very little pigs it may be shelled and soaked.

CHOPPED GRASS FOR COWS.

[Written for Pacific Rural Press.]

Electricity from the San Joaquin valley runs five motors on the Santa Ysabel ranch in San Luis Obispo county. The ranch system includes a large dairy which for 20 years until recently, supplied city milk to Paso Robles. One of the important features of the feeding system is chopped hay, corn, and grass. A Ross No. 40 chopper is run by a 7½ h. p. motor, electricity for which costs $1 per month per horsepower.

One man goes to the field early in the morning and cuts a load of corn or sudan grass and hauls it to the shed beside the feed cutter, which is handy to feed the cows. Two of the milkers feed it into the machine and do odd jobs while the first one is out for another load. Half a ton of green sudan grass is chopped in 15 minutes if it lies straight, according to the manager, P. A. Welty. The cows will leave corn to get the chopped sudan grass, which is sweet and juicy, though rather strawy to be eaten without chopping.

The other motors run pumps, churn, saw wood, etc.

Frank Vander Poel of El Centro has three cows on official test. He has a 40-ton silo, one of the few in the Valley, feeds cotton seed, and does not pasture his cows.

NOW IS THE TIME YOU WOULD APPRECIATE AN

Ideal Green Feed Silo

RIGHT NOW, when dairy products are bringing their highest prices, you would be making an extra good profit from your cows if you were feeding silage.

DRY HAY CANNOT PRODUCE anywhere near the amount of milk that is produced by feeding rich, juicy silage.

GRAIN IS HIGHER IN PRICE—too high to leave much profit for you if you feed a lot of it. But no matter how much grain you feed you will not get as much milk as you would if you fed silage, which costs much less.

SILAGE IS THE LEAST EXPENSIVE and greatest milk-producing feed you can use. If you had put up a silo last summer you would have made enough extra profit this winter to pay for the silo before spring.

SILAGE IS ALSO JUST AS GOOD FOR BEEF cattle and sheep as it is for milk cows. Besides, it is compactly and conveniently stored so that the time and work of feeding is reduced.

DON'T LET ANOTHER WINTER find you without a silo. The cost of doing without one is too great. You are actually paying for a silo this winter, by losing the profit it would bring you and by the extra work doing without one entails.

ASK US TO SEND YOU complete information about Ideal Green Feed Silos. You have more time now to look into this matter than you will when the rush of spring comes on.

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

FATTENING TURKEYS.

To the Editor: Please give full directions for fattening turkeys; say whether corn, wheat, or barley is best, and should it be cooked or not.—M. H., Waukena.

[There exists a great difference of opinion as to what is the best grain, or assortment of grains and meals, to use in fattening turkeys to produce extra choice table qualities. A simple method, and one that saves much time, is to allow the turkeys to continue on range, and feed white or yellow corn in the evening. Under favorable conditions fair results may be obtained in two weeks or even ten days; but the best finish is secured by devoting a full month to the work. If only two weeks or less are allowed for the task, they must be fed a little corn for two days and for the remaining period all they will eat each evening at about roosting time. When adopting the thirty-day method in connection with free range, proceed as follows: Begin by feeding three or four grains of corn for each turkey just as they get ready to fly to roost. Each day add two or three grains to the ration for each bird and also feed about five minutes earlier than the previous day—next day ten, the following day fifteen minutes earlier, and so on. Continue with this daily increase of corn and earlier feeding time until a week or ten days before killing time, after which they may be fed all the corn they will eat up clean. This method encourages the production of an abundance of tender lean meat and moderate quantity of fat. Over-fat turkeys are not desirable. It is remarkable how quickly the turks learn that supper time comes a little earlier each day and that the supply of corn increases. By the time they receive a heavy feed of corn they will come in early enough to materially reduce the ranging time and increase the period of loafing and fattening. They must have a constant supply of good, sharp grit, broken shell, charcoal, and ground bone if best results are to be expected.]

BLACK POLISH FOWLS.

To the Editor: At the Exposition poultry show in November, I saw some fowls that were strange to me. They were black with very large top-knots resembling a large white rose. I would like to know the name of them and where they can be purchased.—J. L., Princeton.

[The fowls mentioned are White Crested Black Polish. The only California birds of this variety at the Panama-Pacific poultry show were exhibited by Jas. Rolph, Jr., of San Francisco, who entered a beautiful trio of matured fowls for exhibition only.]

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Ewaysgood, Pomona.]

RAISING THE CHICKS.

What was recently said about White Leghorn chicks applies equally well to Brown Leghorns, Andalusians, Campines and all the small breeds that do not have crests or other ornaments that prevent them seeing their way about.

The first few days feed sparingly of something easy to digest and if possible let them have sweet skimmed milk to drink.

There is one thing that many people do in raising chicks that is not productive of good to either side and that is the mixing of varieties. To mix Brown and White Leghorns does no harm because both varieties are equally active and aggressive but it is not as a general rule good policy to mix breeds. Keep each separate if possible and you will get better results from both.

In caring for Houdans or Polish chicks, attention must be given the crests and beards, for they are great places for head lice, fleas, etc.; also if there are hawks or cats around these chicks are the first victims because they cannot see the enemy. A friend of mine who keeps Houdans carries a small pair of scissors in his pocket and with them cuts the top knots away from his hens' eyes so that they can see better. Houdans are good, hardy chicks but very timid when among others so that it pays to keep them separated.

After chicks are a week old give them some form of green feed every day and keep the young ones clean. If feed is thrown out where it gets wet, be sure it is not sour when the chicks find it, for there is nothing that will start bowel trouble so soon as sour feed. If, by accident, this should happen, clean up the ground by spading or remove the chicks to new ground, as that is the quickest cure.

SOME MEAN HENS.

To the Editor: I have a lot of chickens, no eggs for six weeks and a 40-acre farm to run on. I feed maize and grain in stack, barley, wheat and oats. About half of them are sick and water will run out of their mouths when they are held upside down. The feathers get thick and stick together next to the flesh and seem dirty. Don't find many lice. Feed plenty of gravel and furnish them running water. I have a terrible time making the young pullets sleep on the roost. They want to get in a corner on the ground; also like to hide away at nights. My chickens are of mixed breeding.—H. L. H.

[With plenty of feed, running water and 40 acres of land to roam over, one feels like asking, what more do hens want? But we know that they do need more and that is careful handling and proper housing when they are being raised. And that is where the trouble is in this case. These chickens, you notice,

Poultry Breeders Directory

MAHAJO WHITE ROCKS—Incubator Chicks, $25 per hundred. Hatching Eggs $10 per hundred. The best all-purpose fowl for farms and the most profitable one. Lay well and consistently; best for capons and broilers. Beautiful snow white plumage. Gentle dispositions. Colonize them in your orchard and reap double profits. Send for catalogue. At Panama-Pacific Poultry Show were awarded sweepstake on Cock (295 Egg type), as best utility bird in show. 200 Birds competing. Mahajo Farm, Box 597, Sacramento, Cal.

WE OFFER 10,000 R. I. RED CHICKS during Feb'y at $12.50 per 100. Lots of 1000 or more at $12. Also 1500 Barred Rock chicks at same price. 5000 White Leghorn chicks at $10 per 100, or $90 per 1000. All of these are pure-bred high-class stock. These prices are special to secure early orders. Write us your wants today. Free 65-page catalog. Pioneer Hatchery Co., 620 S. Spring St., Los Angeles, Cal.

WHITE ROCK BABY CHICKS from good winter layers. Booking orders now. Early hatched chicks make early Fall layers. Few Hoganized cocks for sale. Mrs. J. B. Tupper, Ceres, Cal.

ROOFDEN CHICKS are hatching every week. When do you want yours? White Leghorns that are worth while, by hundred or thousand. Black Minorcas, beauties, great layers of big eggs, and a hardy strain. Rhode Island Reds, the breed for meat and winter eggs. We can supply you with prices that are right. Ask us. Circular free. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

BABY CHICKS—All sturdy youngsters from good stock and hatched right. Rhode Island Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Orders booked now for delivery any time to suit you. Campbell Poultry Ranch, Campbell, Cal.

are mixed; some like to roost high and some low, and to even matters up our friend has allowed them to huddle up in the corners at night. Now he begins to think they ought to perch and they are afraid so they hide.

While they have been hiding in corners they have taken cold; the feathers being sticky next to the skin is proof of colds, which are fast developing into roup.

The remedy is to clean up well, sort the chickens out, put all that have colds or roup by themselves and build the well ones up with good stimulating feeds.

Grain, gravel and range are not sufficient to produce eggs in winter. Your hens need some animal food, beef scrap, fish meal; or better yet, get a few sacks of good ready-mixed mash feed from your dealer and your hens will lay.

Give the sick ones some of the same feed and add a little bluestone to their drinking water. Clean up and spray your houses, and if your young stock will not roost, put about one foot of straw in the hen house so that they can sleep warm without crowding one another.]

SILAGE FOR POULTRY.

An English paper says: "Miss Gillett has built a concrete silo. Her idea is to make ensilage of green maize and lucerne and use it as food for hens. Her theory is that the digestion of so much dry corn as given at present, is a strain on the organs of the birds, which keeps them back, so to speak, and which may be obviated by use of more easily assimilated foods, having an equal constituent value."

STATE POULTRY SHOW AT SACRAMENTO.

[Written for Pacific Rural Press by Geo. H. Croley.]

In connection with the Sacramento Poultry Fanciers' Association, the California State Poultry Association held its first show in the Kirk-Geary building, Sacramento, Jan. 14-18. The hall was well lighted and its size provided room for wide comfortable aisles. About 400 fowls, including turkeys and ducks, of high quality were exhibited. The heavy and general purpose varieties were greatly in the majority. Barred Plymouth Rocks led in entries followed closely by the White variety, while Rhode Island Reds were third in number of exhibits. The attendance was satisfactory but not as great as it should be in a city like Sacramento that is so intimately interested in diversified agriculture. The officers of the associations considered that for a first show it was a success in every way.

Judge Hinds states: "Measured by Standard quality this little show averaged fully up to the Panama-Pacific Poultry show while in Barred Rocks they were ever of a higher average. The method of judging by the use of score cards gave universal satisfaction; even those who failed to take a prize semed satisfied because the score card records the reason for cuts and provides a guide for future breeding. It required three judges two days to place the awards."

Exhibitors reported a number of sales, notably among which was the sale of ten Barred Rock eggs by J. B. Roe of Pasadena to Mrs. James Hay of Lodi at the price of three dollars per egg. These are to be furnished from a pen made up of the first prize cockerel mated to six of Mr. Roe's best breeding hens.

Included among the educational features of the show was an egg testing demonstration and a good display of poultry appliances by Spratts Patent, F. F. Smith & Co. and the Rogers Mfg. Co.

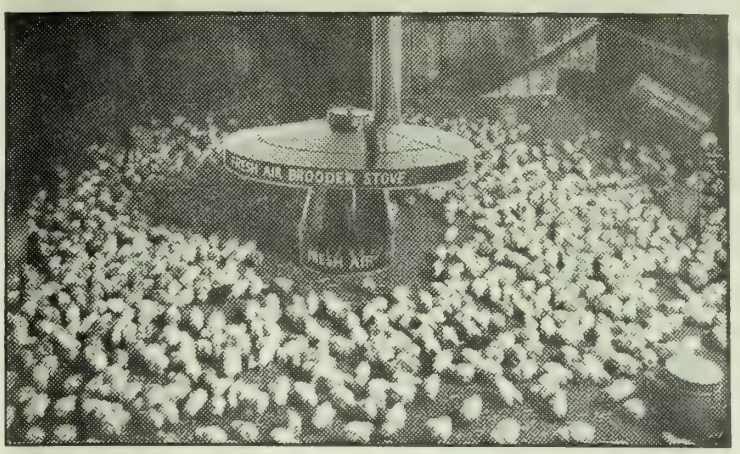
On Jan. 17, the State Association met at the Travelers Hotel to act upon the report of the committee on constitution and by-laws which were adopted as recommended. The by-laws direct that: "The show shall be held each season between Nov. 20 and Feb. 1, and shall not be held in the same city or place oftener than once in three years. Only licensed judges shall be employed to place the awards. The annual meeting shall be held in Sacramento during each September or during the time of the State fair." The name of the association was changed to the California Poultry Breeders' Association. San Francisco, Modesto, Pasadena and San Diego have bid for the next show but the place for holding the next exhibition will not be decided until after April 15; in the meantime any place with a poultry organization may make application to the secretary at Sacramento.

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

At the White Wings Poultry Farm, near Live Oak, the foundation for a new brooder house has been laid. This house will be 60 feet long and is intended to accommodate 2,000 chicks.

At the Los Angeles poultry show there were on exhibition seven breeds of turkeys totaling 53 birds. Plymouth Rocks, made up of four varieties, barred, white, buff, and partridge, led the show with 319 entries.



Mrs. D. W. Spragge of Hayward has just received a shipment of trapnested White Leghorns from Mrs. E. B. Martin who captured nearly all the Single Comb White Leghorn prizes at the Panama-Pacific Exposition poultry show.

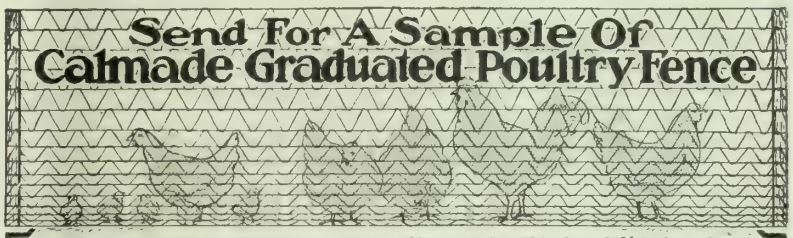
United States Consul Felix S. S. Johnson, at Kingston, Ontario, reports that the Canadian Department of Agriculture at Ottawa has provided marketing standards in three general classes of eggs following closely the descriptions presented in the illustrated articles that appeared in the Pacific Rural Press during January and February, 1915.

The annual meeting of the Sonoma County Poultrymen's Federation was held Jan. 9 in Petaluma. The financial report for the year 1915 was adopted. This report demonstrates that the past twelve months have been satisfactory for the poultry keepers who are members of the marketing organizations that make up this federation.

At the annual meeting of the Sonoma County Poultry Fanciers' Club, held in the Chamber of Commerce at Santa Rosa, Jan. 6, the following officers were elected: President, J. P. McDonough; vice-presidents, J. H. Fahrenkrog, Dr. F. J. Kinley, J. Evans; secretary, D. Harkness Currier; treasurer, A. H. Currier; directors, Carl A. Lone, B. Foote, Frank Powell, and A. Bellici. The date of meetings was changed to the second Monday of each month.

In the Mediterranean classes we surprised the world with our California exhibits. In connection with descriptions of the show, the following opinions were expressed by noted writers: "If any better ones are produced in this country, north, east, south, or west, we do not know of it."—Grant M. Curtis in Reliable Poultry Journal. "Truly wonderful."—C. W. Pierce in Inland Poultry Journal. "Opened the eyes of the judges."—C. F. Williams in Northwest Poultry Journal. "If there are any better, we have never seen them."—American Poultry Journal. "Finest I ever saw."—Judge A. H. Currier, in Fancier's Monthly.

The Fresh Air Brooder Stove



It's greatly improved this season; it gives more fresh air through the base and controls it better than ever. We also have a new combination hot water system with our famous burner that skins anything you ever saw. But we can't tell it all here, so get our 1916 catalog. It's a dandy and you need it.

This ad will appear the first of every month only. Save it.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1⅝ inches then 20 inches of 2¼ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

The Home Circle Page of the Pacific Rural Press

Let's Give the Modest and Princely Prune a Place in the Sun.

Though Monarch of Laxatives, Plebeian Rivals Undermine Him in Public Favor.

Just the other day a suggestion was made that struck the Home Circle staff like a ton of brick.

It is the wisest thought uttered in many a long day about a Pacific Coast product. It touches upon and appertains to Prunes.

Probably everyone has noticed that within the last year a new remedy for constipation has been prominently offered in drug stores. It is a clear, colorless, tasteless, odorless oil of about the consistency of glycerine; but instead of being an animal or a vegetable product it is a mineral oil and is one of the products of petroleum, said to be an unusually refined form of paraffine. It is of European discovery, and is known by many different names, depending upon who markets it. One of its earliest introductions was under the name of Russian oil. It is safe to say that all the brands are all good for what they are intended to do—lubricate and promote the action of the intestines. These oils will "grease your innards" and do it well. Which is all they can do. The Standard Oil, with its usual enterprise, is said just now to be devoting an appropriation of $100,000 to advertising its own particular brand of this latest laxative.

Which moved Mr. Frank Swett, a thinking and substantial farmer and citizen of Martinez, Contra Costa county, to say in the hearing of the Home Circle:

"Here's a profound lesson. If a big concern can profitably devote a fortune to advertising artificial laxatives, isn't it reasonable to believe that the prune growers could afford to spend at least as much on publicity for the peerless natural article? The prune outclasses anything that has ever been employed as an intestinal regulator. It is Nature's delicious medicine, price 5 cents. Besides being a lubricant it is nourishing, and you don't have to pour it out of a 50-cent bottle. It is at one time a remedy, a food and a dessert. And it is infinitely the cheapest. Properly known, the prune need fear no rivalry. The time will come when the world is rightly educated to the rich gifts of the prune, and the medicine shelf will take a holiday and the prunegrower will wear medals."

As education begins at home, this department wants to remind every reader of the simple facts; with no desire to interfere with the delights of dosing, mind you, where dosing is the choice of anyone, but just as a reminder of the fact of the prune.

The prune is on every hand, waiting to be of service, and should not blush unseen.

In order to promote a better acquaintance with the prune, a flock of handy recipes is published herewith, for those who would rather pick an appetizing physic off a tree than brew it out of senna, or munch it as cascara, or gulp it down as salts, or pump it out of the bowels of the earth into their own.

A WAY TO PREPARE STEWED PRUNES.

(This Week's Preferred Recipe.)

Pick over the PRUNES, wash in warm water and rub well; soak over night covered with cold water. Cook slowly, covered closely, till they are tender. Take out fruit with a skimmer, leaving juice; add sugar and lemon to juice to taste and boil about 5 minutes for thin syrup, or longer for thick, and pour over prunes after straining.

PRUNE COBBLER.

Mix well 1 cup flour, 1 teasp. baking powder, and 1 cup milk; add juice from 1 pint of stewed PRUNES, ½ cup sugar, 1½ teasp. melted butter or 1 teasp. melted cottonsced shortening, and then 2 beaten eggs and 1 teasp. salt. Put the prunes in bottom of a greased baking dish and pour the mixture over them and bake ½ hour in moderate oven. Serve with sauces or whipped cream.

HOME PRUNE CAKE.

One cup sugar, 1½ cups flour, 2 eggs, ½ cup sour milk, 1 cup mashed stewed PRUNES, 1 teasp. baking powd., 1 teasp. baking soda, cinnamon and cloves to taste.

After dissolving soda in the sour milk and adding baking powder to the flour, and creaming the shortening with the sugar, add these to the eggs beaten well and add the prunes and spices. To be baked very slowly about 15 minutes.

BAKESHOP PRUNE CAKE.

One pint flour, 2 tablesp. sugar, 1 egg, 2 tablesp. butter, ¼ teasp. salt, 1½ teasp. bak. pdr., 1 scant cup milk.

Sift the dry ingredients together and rub in the butter, after which add the milk and egg well beaten together. This makes a dough, which spread in a buttered pan about an inch thick. On the surface lay split stewed PRUNES, flesh side up, and after dotting the whole with tiny lumps of butter sift powdered sugar over it, and bake. This can be served hot with sauces or cream, or eaten cold.

PRUNE OMELET.

One cup stewed whipped PRUNES, 1-3 cup sugar, 3 eggs, whipped, ½ tablesp. cornstarch dissolved in 2 tablesp. milk.

Mix these ingredients and beat well and bake slowly about 20 mintues. To be served hot.

RICE AND PRUNE DESSERT.

Mix stewed PRUNES and hot rice in a dish, let cool, and then turn out into another dish; dust lightly with powdered sugar and cinnamon, or serve with sauces or sweetened prune juice.

PRUNE SOUFFLE.

Wash ½ pound of PRUNES in warm water; then soak them six hours covered with cold water, then stew till tender in the same water. Drain off the water, remove the stones, rub through a collander, sweeten to taste and beat into a smooth paste. Add whipped white of four eggs; turn into buttered baking dish and bake 20 minutes. Serve hot or cold with whipped cream.

PRUNE FILLING FOR CAKES.

One cup sugar, 1-3 cup boiling water, 1 white of egg, 1 cup chopped stewed PRUNES, 1-3 cup chopped blanched almonds.

Make a boiled frosting of the sugar, water and white of egg; then add the prunes and almonds.

Without making a boiled icing the prunes and almonds can be added to the whipped eggs with ½ cup powdered sugar.

JELLIED PRUNES.

One-half box gelatine, ½ cup cold water, 1-3 pound PRUNES, 1-3 cup corn sirup, 2 cups prune juice, ⅔ cup sugar, ¼ cup lemon juice.

The gelatine should be dissolved in the water. The prunes should be stewed, stoned and chopped. If the juice left is not 2 cups, add enough hot water to make it so, and add this juice to the gelatine solution with the sirup and lemon juice and sugar. When sugar is dissolved, add the chopped prunes, and stir several times while cooling to prevent prunes settling to bottom of jelly. Serve chilled if possible.

PRUNE TRIFLE.

One cup scalded milk, 1½ level tablesp. cornstarch, ¼ cup cold milk, ½ cup corn sirup, ¼ teasp. salt, ¾ cup stewed, chopped PRUNES, 1 egg white.

Thicken scalded milk with cornstarch which has been wet with the cold milk, add sirup, salt and prunes. Cook, covered, for 15 minutes. When cool stir in 1 white of egg well beaten and warm on fire enough to firm the egg. May be served with whipped cream when cold as possible.

PRUNE BROWN BREAD.

Two cups graham flour, 1 cup corn meal scalded, ½ cup molasses, 1 cup sour milk, 1 cup minced PRUNES, 1 teasp. salt, ½ teasp. baking soda.

Sift flour, soda and salt together, then mix in other ingredients, prunes last. Steam for 3 hours.

PRUNE PUFF OR WHIP.

Three whites of eggs, ¼ cup powd. sugar, 1 cup cooked PRUNES finely mashed and beaten.

Whip the egg whites to a stiff froth, adding slowly the powdered sugar while beating; add prunes, beating all together. Bake about 10 minutes in a pudding dish. Serve with a soft custard made from the yolks of the eggs; or with whipped cream. Good hot or cold.

PRUNE PUDDING.

One pound PRUNES, ¾ cup sugar, ⅔ cup bread crumbs, ⅔ cup flour, 1 cup suet, 2 eggs, 1 cup milk, ½ teasp. salt, 1½ teasp. baking powder, grated nutmeg to flavor.

Scald and wash the prunes, remove stones, and chop finely; mix with finely chopped suet and add them to the sugar, flour, bread crumbs, nutmeg, salt and baking powder. Put into a greased mold and steam 4 hours.

SALAD OF PRUNES AND NUTS.

One-fourth pound nut meats, shredded, ½ pound PRUNES, stewed and shredded, 1 cup thick cream, whipped and flavored with paprika, salt, lemon juice; and sherry wine if desired.

Cook the prunes as usual, except that the liquor must be allowed to nearly evaporate and the prunes taken off fire while still firm, to permit of slicing when cold. Mix the prunes and nut meats and sprinkle with salt and paprika, and mix with most of the whipped cream. Put a spoonful of this on each individual plate on lettuce leaves. The remaining whipped cream can be used to put on top as garniture, with nutmeats and sliced prunes.

AN ODE TO THE PRUNE.

By Fred Schaefer.

O mellow Prune!
O gentle, healthful laxative,
To thee this tune
I'll warble all the years I live:
"Thou shieldest me from ills,
Most frabjous of all fruits;
Pale people could sidestep pinkish pills
As substitutes—
(As substitutes for thee, O Prune)
if they ceased to underrate you—
And ate you!"

THIS WEEK'S BEST HOUSEHOLD HELP.

Keep a 10-pound box of PRUNES always on the pantry shelf, and serve some of them in some form daily!

EXPERIENCE EXCHANGE.

Here is that chocolate pie recipe for the Porterville reader. It is sent by A. J. of Berkeley: 3 tablesp. ground chocolate, 1 tablesp. corn starch, 1 cup sugar, 3 tablesp. cold water and yolks of 2 eggs beaten light. Stir water and corn starch until smooth, add 1 cup boiling water to the chocolate, add sugar, corn starch and eggs in the order named, beating all well; add a pinch of salt and flavor with vanilla. This is the filling. Pour into crust which has been baked separately in a pie pan. Place on top meringue of whites of eggs and brown delicately in oven.

In reply to a subscriber who asks for an onion and celery sandwich recipe, the following is offered: Soak a good-sized onion and one head of celery in cold water for an hour; drain and cut in small pieces, mix with French dressing and spread on buttered bread.

MRS. BEST'S BULLETIN.

My dear Friends: Just as I have suspected, they have arrived—the dashing, flashing, clashing models of the daring springtime fashion.

The new garments are in such a variety of colors and patterns that it becomes a guessing game with the stores. They perforce must gamble with the tastes of their patrons. Some are going to win and some are going to guess wrong. There seems to be no average upon which to rely without chance of disappointment, I means in patterns. They are so various.

Of course the modes that have reached the coast agree well enough in cut. There is the flaring collar, the flaring coat, the flaring skirt, and the shortness of said skirt. There is also the rather wide belt, sometimes sewed to the coat and sometimes separate, and the sleeves with the new cuffs.

But the patterns and colors! As one friend expressed it, every woman can be a Josephine of many colors.

Almost any color you wear will be in style if you console yourself like the dialect comedians. One said:

"I see you still vear a vite vest, Shulz. But der fashion iss mouse-colored vests."

"I know it, Schmidt—but diss iss a mouse-colored vest like vite mice."

One pattern I saw was in black and white checks of small size, the trimming being plain green silk on the collar and cuffs.

Another was in violent large checks, subdued only by a gray block alternating with the black and white.

Still another was of wide white and nearly-black stripes, the stripes broken to run the other way at the bottom of the skirt half way around to give a panel effect in front.

In solid colors there was a cerise affair with a very narrow white edging.

One coat to be worn with your choice of skirts was in riotous burnt orange stripes modified by stripes of lighter yellow tones.

High boots of cream kid were shown to accompany this new style in walking costumes.

Hats, both broad-brimmed and turbans, are offered to complete the costume. Many of the wide-brimmed hats are quite simple as to trimming, but the covering is in wide white and colored stripes.

On the whole, I think the Easter parade will be worth looking at. But more anon.

Devotedly,

ROSABELLA BEST.

Very Much Alive.—One day the teacher of our school was explaining what conscience meant. She said, "It is that little voice within us which whispers to us not to do any wrong." Little Willie then raised his hand and said: "I know what you mean. Yesterday when I would not go to the store for my mother, it growled at me."

As It Is Done.—"Well, I made $2,000 this month, enough to pay all my debts." "What kind of car are you going to buy with it?"—Harper's.

HOMEWARD BOUND.

Homeward bound! Homeward bound!
Countless sailors on life's sea,
Sailing onward, sailing ever
Toward the vast, the bright forever,
On ships of destiny.

Do we know, we troubled sailors,
That the sea on which we rove
Is the vast and boundless ocean
Of the Father's changeless love?

Know we that the clouds above us
Are but shadows of God's hand?
Guiding, pointing, ever beckoning
Onward to the better land.

And the floods of sunshine round us
But reflect His gracious smile;
Warming, lighting, cheering strengthening
As we ever onward sail.

And the countless stars far shining
Are great spirits gone before—
Brightest beacons to direct us
To the far-off heavenly shore.

When the night shuts down around us
And the sunlight hides from view,
Then new stars are set in heaven
Just to keep our course more true.
—Seattle Post-Intelligencer.

LUMP SUGAR AND THE PRINCESS.

Lump Sugar was the poorest child in Candytown, and had to work as a servant for the Bonbon family, who did not treat her at all nicely. They made her scrub the floors and wash dishes all the time that she was not running errands for the Bonbon girls or hooking their many dresses up the back.

One night the Bonbons gave a large ball in honor of a visiting Candy person, whom every one called the Crystal Princess.

The Bonbons made Lump Sugar almost run her legs off getting ready for the party, but when she timidly asked if she might be allowed to stand in a corner and see the guests come in Strawberry Bonbon said: "Of course not! You must stay in the kitchen, for you are not fit to be seen by our stylish guests."

Poor Lump Sugar! She went back into the kitchen and cried and cried.

Soon the guests—the Taffys, the Caramels, the Nougats and all the rest of the Candy people—began to arrive. The Grasshopper Orchestra played madly, and the Bonbons, who were looking their prettiest, stood in a row, saying charming things to their guests—no one could have imagined how disagreeable they often were to poor Lump Sugar.

But when the Crystal Princess arrived even the Bonbons were cast in the shade, for she was the prettiest of all. All the Candy boys circled around her and begged for dances. Young Sweet-Chocolate got the first one. After they had danced—and a wonderful dance it was—the Crystal Princess asked for a drink of water. "I'll get it for you," said Sweet-Chocolate, and he ran out to the kitchen, where he found Lump Sugar in her old dress, sitting sadly in a corner.

"Well, Lump Sugar," he said, "why aren't you at the party?"

Lump Sugar said nothing, but looked sadly down at her poor old dress, and Sweet-Chocolate guessed the reason. "Wait a moment," he said, and rushed back to the ballroom, where stood the Crystal Princess. He whispered something in her ear, and the Princess smiled and went with him to the kitchen.

Lump Sugar rose with a start and stared at the Princess, and the Princess stared at her. And as they stood there together Sweet-Chocolate had to pinch himself to make sure he was not dreaming—for in spite of the difference in their clothes he saw that they looked really alike!

"Who are you?" cried the Princess distractedly to Lump Sugar.

"Why, I'm only Lump Sugar," stammered the other.

"Oh," cried the Princess radiantly, "if you are Lump Sugar you are my own sister, for whom I have been looking everywhere—for my name is Sugar, too, only I am Rock Sugar, or Rock Candy, as they sometimes call me. Our different garments are just an accident, and inside we are of the same blood, and that is the purest and best in all Candytown. And now you must come back with me to the party while I tell them all the good news!"

Lump Sugar could hardly believe her ears, but it seemed that she and Rock Sugar were really sisters, only Lump Sugar had been dropped out of the baby carriage by their careless Sugar-Cane nurse when they were little, and so lost. When the Candy people heard the news they were delighted, all except the Bonbons, who could hardly conceal their mortification. Lump Sugar went away that very night to live with her sister in the Sugarloaf Mountains, and they had the most beautiful times you can imagine.

Sweet-Chocolate was often asked to their house for parties, but the Bonbons, never—at least, not for a long time.

ROSE PLANTING TIME.

Now is the good time to plant roses. The bushes become well rooted, and with good care in the spring they will respond with a wealth of blooms.

Among the best roses for show purposes are Maman Cochet, Mildred Grant, Hugh Dickson, Duchess of Sutherland, Caroline Testout, K. A. Victoria, and White Maman Cochet.

For home decoration, however, plant Lady Roberts, Lady Hillingdon, Etoile de France, Safrano, Madam Melaine Soupert, Jules Gravereaux, the Duchess, La Tosca, the always popular American Beauty, Helen Gould and Marie Van Houtte.

Among the climbing roses, the pure white old-fashioned La Marque is considered the best of the climbers, the Marechal Neil, Gold of Ophir; the Cherokee both single and double, the San Rafael (Beauty of Glazenwood) the Wm. Allen Richardson, the Climbing Bridesmaid, and the True Friend or Climbing Cecil Bruner can always be relied upon.

SCHOOL MOTHERS' CLUBS.

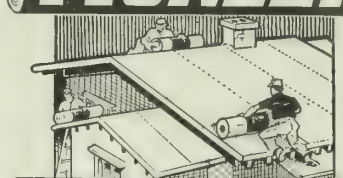
The school Mothers' Club has come to stay, and every woman, be she a mother or not, from now on should take serious consideration of it as a form of womankind's modern usefulness. It is a development of feminine activity that is of incalculable importance to the state and nation. It is demonstrating woman's worth in citizenship.

A thing well worth considering is that in the interest of parents in the education of their children, especially of the mothers, the protection and stabilizing of the American public school system lies. With the American family for it, nobody can undermine it; and with the mother for it the family is for it.

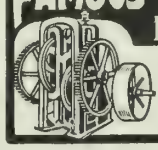
HOME-MADE BONBONS.

There are two ways of making bonbons at home—the hard way and the easy way. The hard way entails making fondant, or cooked creamed sugar, as a preliminary step, after which one proceeds to mold candies out of it. Another way and quicker is to stir up some confectioner's sugar and mold candies out of it. Confectioner's sugar, so called, is a very finely pulverized sugar, usually sold under the name of powdered sugar, and is spoken of as confectioner's sugar because it is used by confectioners for wedding cake icing. It is not often sold in groceries, which seldom have a call for sugar of such fineness. By the way, many people do not have success with elaborate icing recipes calling for a stiff icing because they do not get the right grade of powdered sugar. The XXXX is the thing.

For a small batch of easily made bonbons, take the white of one or two eggs, with a teaspoonful of water to each egg, and stir up enough of the sugar with it to make an easily molded light cream. Now of this you can shape your bonbons, after adding a bit of flavoring to various portions of the cream. This is done by stirring into the portions respectively a few drops of vanilla extract, oil of lemon, oil of orange, oil of peppermint, oil of wintergreen, etc. The various oil flavors are very pungent and should be most sparingly used if a delicate flavor is wished. There are vegetable colors obtainable for coloring these candies but it is not worth the expense. A pretty fair green may be obtained by using the juice of spinach leaves. Grated orange peel put into a mixture of alcohol and water will provide both a flavor and color for a portion. Nuts, slices of citron, candied cherries and pineapple provide garniture or filling for the various bonbons, in fashioning which the greatest ingenuity can be used.



"HELP WANTED — MALE."



WANTED — A GENUINE BOOKkeeper; one who can milk a cow, chop wood, play the piano, and rock the cradle. Box 23, Dilley, Tex.—Adv. in the San Antonio Light.

Unappreciated. — Auctioneer (at art sale, reproachfully)—"What! No advance on three shillings? Why, the picture by itself is worth that!"—Punch.

She Agreed.—Mary—Mrs. Delaney says her little girl has learned to play the piano in no time. Alice—Yes, I heard her playing just that way the other day.—Life.

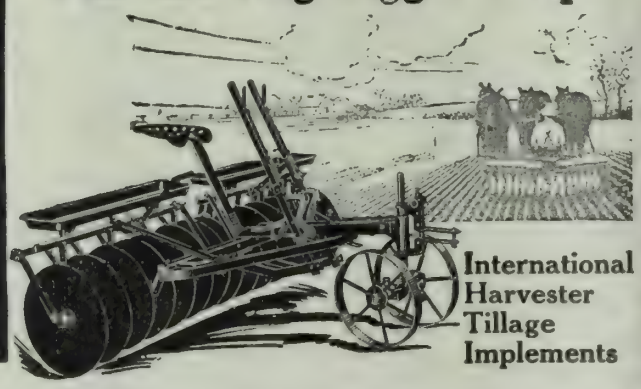
Monarch Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Chisel for bean and beet ground before planting, it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.



As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market. Made in 5, 6 and 8-foot sizes.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO 1915

For Growing Bigger Crops

International Harvester Tillage Implements

THE better your seed beds the more money you make from the same acreage. The best seed beds are made with **International Harvester** disk harrows, spring-tooth harrows, and peg-tooth harrows. Our tillage catalogues explain fully, but read here a few reasons why these machines give the best field service:

Disk harrows have adjustable snubbing blocks for making the gangs level, and bowed set-lever bars to keep them level when the angle of the gangs is changed. The bearings are especially designed to avoid all unnecessary friction, and make the harrows that much easier for the horses to pull.

Spring-tooth harrows have frames that slide on the ground and keep the cutting depth uniform. They can be used in sod, as well as in wet or stony land, which they are specially made to till.

The all-steel **peg-tooth harrows** are made up of stiff sections, that give the lumps strong action and leave the surface smooth.

These features, and many others that are money makers for farmers, are explained fully in our tillage catalogues, which we send promptly on request. Write for one, and read it over, before you go to the local dealer to see the implement you are interested in. The catalogue helps you to buy right.

Raising Horses for Farm and Market.

An Instructive Outline Showing a Constructive Way Out for the Horse and His Position with the Farmer.

[Written by Gordon F. True, University Farm, Davis.]

WHILE horses are as a class the most valuable of the domestic animals, less apparent thought is given to their breeding by farmers than to the other classes of stock, cattle, sheep or hogs. One reason for this is to be found in the fact that on most ranches the horse stock is kept primarily for work, and such colts as are raised are considered in the nature of a by-product —they are incident to the keeping of horses rather than the result of a purpose in keeping them. Another reason is to be found in the high price of stallions. Thus the high value of the animal which should furnish an incentive to the best effort and thought becomes an excuse for the lack of care upon which success in any line of breeding must depend. The proper care of a stallion is a more or less exacting task, requiring more time, patience and special knowledge than most ranchers feel that they can give. Few men on ordinary sized ranches have enough mares to justify the purchase and maintenance of a stallion for their individual use, so the habit has grown up of depending on the chance that some one else in the neighborhood will provide a horse, the services of which may be secured. Thus the mare owner, instead of breeding systematically to stallions of his own choice, uses such a one as happens to be standing in his neighborhood. Too frequently this horse is not of a kind that would be expected to sire the most desirable offspring.

THE SHIRE STALLION STOW ROYALTY,
Purchased by E. W. Westgate, Jr., from Truman's Pioneer Stud Farm, for Use on California Mares. A Prize Winner at P. P. I. E

Company Horses.—It would naturally be expected that in the company horse the solution for the difficulties suggested might be found. But the system of selling horses as they are too frequently sold to companies in the West is such as to make the stallion cost his purchasers two or three times his real value. Upon delivery, he is usually too fat for best results in the stud, and upon letting down in flesh very often loses that fine appearance that made him look worth buying when offered for sale. I am not finding fault with the stallion dealers. They are usually enterprising men who, working on the principle of the great P. T. Barnum, who believed in doing the people as they wanted to be done, have placed many good and less good stallions in communities where otherwise probably no horse would have been bought. As some one else has put it, our farmers, instead of buying stallions, wait to have horses brought to them for sale—and take what is brought too frequently without much question. This thing has been carried so far in California that the average mare owner would be scared if a right good horse were offered him at a reasonable price. Too frequently the best mares on the place are sold—because the best find most ready sale—and those that are too small, too ungainly in conformation, have blemishes or even unsoundness, are kept on the farm and become the breeding stock. A man who makes a business of breeding farm animals finds it necessary to keep the very best that he can raise in order to reach high rank as a breeder. The wise breeder never prices the best females in his breeding herd.

As to the future of the draft-horse industry of the country no one can prophesy with certainty. The fact that good heavy horses were never harder to buy in California than at the present time, is sufficient evidence that there is demand for the better classes of draft horses. The fact that the work horses of Europe have been driven into the mill of destruction during the past two years should furnish assurance that for the next decade at least there will be a demand for sound horses suitable for heavy work.

The Kind to Raise.—I have been asked to write on raising horses for farm and market. The farm should raise the market horse and the market horse should, up to the time of his sale, do the work of the farm. It is a mistake to consider that there are two types of heavy horses—one for farm work and the other for market. The farmer should aim to produce from his work stock the kind of horses the market demands, and the kind of mares that can produce market stock should do the farm work. There is no reason for trying to maintain an idle breeding band of mares. The best pure-bred horses from the European countries are grown from mares that work every day of their lives on small farms. Our own market animals should be grown in the same way. The fine heavy horses shown in the harness by McNab and Smith at the Panama-Pacific were all purchased in Iowa and Ohio. There could be no stronger evidence than this that there is a demand for good heavy horses for work on the streets of the Coast cities, and that the California farmers are not meeting this demand. There could be no more conclusive evidence that the right kind of stallions are not being used in the state, and therefore no stronger proof that the

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., January 25, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	3.65	24.84	23.05	56	38
Red Bluff	2.48	15.80	13.31	56	32
Sacramento	1.28	13.55	10.01	54	32
San Francisco	2.54	20.29	11.72	56	40
San Jose	1.58	12.60	8.49	60	34
Fresno	1.38	7.72	4.88	54	36
Independence	.64	7.97	4.83	38	—
San Luis Obispo	2.22	18.35	9.61	58	32
Los Angeles	1.67	14.59	7.32	64	42
San Diego	1.04	8.12	4.79	60	46

THE WEEK

A Solano county reader calls upon us to crown Rehart, the Oregon weather prophet, as the court prophet of this imperial outfit. He says he has watched Rehart for eight years and his forecasts have arrived every time—hitting the mark even in a year when we said he had missed it. That surely is pretty good for Rehart, and we would be inclined to proclaim him our original and only weather prophet were it not that he seems to be manifesting this year such a disposition to overdo it. It has always been that way with prophets; people have wearied of their excess-efficiency and have, too often, rocked them to sleep. We are loth to subject Rehart to that peril. Besides, he is near enough now, we should judge. He is giving us this month Columbia river weather, and if he should move nearer we fear he might bring down upon us all the weather-resources of Alaska. Thank you sincerely, Mr. Rehart, but will you not please quit now for awhile and allow us to get to plowing and planting uplands and draining the lakes on the lowlands? Califoria is famous for plenty of time to work between the rains, but so far this month it has been impossible to get even a fork handle between the storms. The teams are eating their heads off and gasoline is going up all the time!

Our Colonels Are at It.

Col. Weinstock directs his howitzers at the other colonel's position on another page of this issue, and, so far as we can see through the smoke, he succeeds in landing some shells in Col. Irish's onion patch, and it looks as though the latter might have to pull some of his fragrant bulbs out of the sky. The reader will notice the Alphonse-Gaston attitude of the combatants in this contest which we have provoked. Personally, so far as we know, they are old friends, but they hold contrary views of problems in economics and citizenship. They seem to be willing to gladiate a little, not to serve any ill-will or dislike, but for the patriotic purpose of leading our wide constituency of farmers to a careful consideration of concrete facts and governmental theories involved in the rather new line of public service which the present administration of state affairs has entered upon. Col. Weinstock honestly believes this new service is greatly for the public good, and therefore defends and promotes it. Col. Irish, whom we persuaded to act, so far as his inclination and leisure would permit, as protagonist in support of the old, independent and self-reliant initiative and enterprise which have made America great, has no forensic superior in this country. He is president of the Delta Association of farmers, which is creating a new Holland in the center of California. Both the colonels are busy men who have done great work in the world and have much such work still to do. They are therefore engaged in no pastime to amuse our readers, but both feel, we trust, that they can afford to give a little time to the awakening of California farmers to thought and knowledge of the things which are now going forward, largely in their name, but the ultimate significance of which they are not sufficiently nor very seriously considering. Therefore, go to it, serious reader, while it lasts, for it means edification to you—and of course you are entitled to get what entertainment you can also.

To Have a Real Try at Paternalism.

While the discussion noted in the foregoing paragraph continues, and we hope it will continue at least until fundamental differences in policies are made clear, it is interesting to know that one phase of paternalism is to be practically tried out, and that is assisted or endowed colonization. As our readers know it is working well in other parts of the world. Will it work here and with what results? Only demonstration can determine that and only demonstration can show how it is best to work it here, if it does succeed. The most logical place to make the trial is clearly on the lands under the government irrigation works, for that warrants the government participation, and the government has a motive of its own in demonstrating that such reclaimed arid lands can be profitably farmed. And so Professor Ellwood Mead, who has for several years been exiled from his native country in the assisted colonization work in Australia, makes it a part of his work in the University of California to demonstrate the success of assisted settlement under irrigation. The proposition to provide settlement of such lands in such way has been under consideration by Secretary of the Interior Lane for the last two years, and he has approved of the general suitability of the undertaking to meet the government's problem in handling such lands for the public good. The experience of Government projects, and private projects as well, has shown that if we are to continue in this country the policy that was inaugurated with the Homestead Act, that of enabling the man of little capital to become a farm owner, it will be necessary through organization to reduce the preliminary expenses of development, such as building the house, leveling the land, etc., and to provide the money needed for improvements under conditions not now possible to commercial banks, which are a longer time for repayment and a lower rate of interest than prevails in any of the Western States.

An Outlook for School-Made Farmers.

There is another outlook for this interesting experiment, and that is its light upon the young men which the schools are trying to interest in farming. W. C. Wood, commissioner of California secondary schools, states that, on investigation, he finds that the majority of those taking farming instruction in these schools are city boys, and Prof. Crocheron finds it the same way in the University—that is, fewer than one-third of the students in the College of Agriculture are from the farms. Mr. Wood accounts for the fact in this way: "The country boy realizes that after he finishes a high school course in agriculture he will have to go to work for farm wages, unless he has capital that he can invest in land. Therefore, the country boy does not take the course in agriculture, but prepares for city life instead." Now, by this line of reasoning, the city boy takes agriculture because he does not know what he will be up against. But that would not be strictly true because many of the city boys have daddies with land or money who can stake them in rural pursuits, and desire to do so rather than have them take city chances. But Mr. Wood says also: "I believe that a plan of rural credits is the solution of the problem of keeping the country boys on the farm. Until the boys can see something in agriculture besides farm wages, our courses in agriculture will not be popular." From this point of view the demonstration, which it is likely will be made on the irrigation projects, will be intensely interesting and important. It is not to divert from city to country, but to help the country to hold its own.

How This Trial Will Be Made.

The present plan for making a trial of such colonization is to take two moderate-sized irrigation projects, one at Orland, and use the "excess land" which the owners are required by the law to sell so that no owner shall have more than forty acres. The tentative scheme of procedure is as follows: The government will buy this land from the "excess-owners," at an appraised valuation, subdivide it, and sell it to settlers as the law requires. Sales will be made only to purchasers who can give satisfactory evidence of character and of farming experience and suitability. Such purchasers will be required to pay down 5 per cent of the value of the land—the remainder of the purchase price to be paid in 31½ years in annual installments of 6 per cent, of which 4½ per cent shall be interest and 1½ per cent amortizing payments on the principal. No sale can be made to a party owning land elsewhere, and the party must have whatever amount of available cash for working purposes the Secretary of the Interior may determine. The government must supply a practical farm adviser for each project and on his recommendation a settler may secure advances of money from the government in amount from $600 to $2500, according to the size of the farm, etc., for buildings, stock, tools, etc., and this advance must be repaid at the rate of 5 per cent per year, of which 3½ per cent is for interest and 1½ for amortizing. The foregoing schedule of interest, payments, etc., is based upon experience in Australia. It will be for the Secretary of the Interior to determine what terms shall be adopted for use in his department.

The proposition to proceed in some such way has the approval of some of the owners of excess lands in the Orland project who will urge its acceptance upon others. It has the hearty support of the University of California authorities and of Governor Johnson. Manifestly such a scheme will be most successful if developed gradually, and for that reason the two projects named above were selected, as they would not involve an exceedingly large outlay. In Colorado the Governor, the college authorities, and practically everybody favor the movement; much more interest being manifested there than in California, thus far.

A Good Week's Work.

Last week was, and will probably remain, quite notable in California agricultural history as the culminating time for two considerable undertakings in co-operation. As briefly stated in our last issue, the prune growers entered upon the first phase of a state-wide organization through the action of a large convention in San Jose on January 19. In this issue will be found in full form the organization papers adopted on that occasion. These papers show what the committee did in 1915 and the form and purposes of the organization undertaken for 1916, as advised by that committee. It is up to the newly constituted Central Committee of the new organization to adopt their own rules for action and outlines of policy for local organization in all prune districts and for the financing of the undertaking. If the substantial support of the prune and apricot growers can be secured, the way suggested to secure funds for operation ought to yield money enough to do something adequate and efficient. As we see it the first need is an executive secretary, who has knowledge of prune handling, mastery in business methods and enterprises and something like genius in publicity work. He ought to know what the things are which influence the sale of prunes and how to get hold of them. He should have ability and initiative enough to put up to the committee all the facts necessary for their intelligent action — whatever facts they themselves know will then be a working surplus. He ought to be able to organize the most accurate and comprehensive system of supply and demand reporting for the whole world which has ever been constructed; also the best way to make the resulting information available to participating growers. Of course it will take some money to get such a man, but unless such a man is found and he is adequately supplied with funds for expenses, clerical force and good headquarters from which to work, his employers cannot possibly rise to their opportunity. If the prune growers should think they can get along with an ordinary bump-on-a-log secretary they might as well go back to the woods.

The other event which will make last week notable, is the completion of the incorporation of the California Peach Growers, which was reached in Fresno on Saturday. At that time the articles of incorporation were signed by the seven directors elected on Friday by the 25 trustees from different parts of the State, as described on page 92 of last week's Rural Press. The directors elected are named on another page this week. According to resolution, the association will proceed to business as soon as capital stock to the amount of $600,000 is subscribed and 75 per cent of the acreage of drying peaches is under contract. The directors remained in session during the first part of this week preparing the form of contract and otherwise getting ready for work. A manager, president, vice-president and treasurer will be elected by the directors. When this is done the effort for acreage-contract signing will proceed. Thus, although there is plenty of work still to do, the birth of the association will date from January 23—with the length of life still to be determined by the peach growers.

Queries and Replies.

Querists must give name and address.

The Corn-Ear Worm.

To the Editor: Is anything good to prevent worm in corn? And if they are worse in yellow corn than white corn?—C. L. M., Manzanar.

During the last half-year we have printed accounts of the success of M. L. Germain of Los Angeles by dusting the silk as soon as it appears with lead arsenate powder and of Samuel Haigh of San Jose, who sprayed the silk with creolin—one tablespoonful to one gallon of water. Both gentlemen emphatically declare that they practically saved the corn by their treatments. We have seen no difference in kinds of corn affected.

Roots for Cherries.

To the Editor: Can you tell me what are the relative merits of Mazzard and Mahaleb roots for cherries on well-drained valley land?—H. W., Napa.

There is no reason known to us to depart from the decision of the pioneer cherry growers that the black Mazzard is the best root for cherries on such land as you describe, providing the soil is retentive enough to hold a good moisture supply to hold the tree in vigor after the fruit is gathered, or if an irrigation can be given at that time. The Mazzard is, however, liable to fail to support the top growth if there is too much standing water in the winter or too great drying out in the latter part of the summer. Where these conditions are liable to occur the Mahaleb is the hardier root. If this is not right will some grower correct it?

Mint Growing.

To the Editor: I have been requested to furnish information regarding the growing of spearmint. Do you know of any publication that will give the methods of growing and handling mint commercially? — G. W. H., Marysville.

Send to the United States Department of Agriculture, Washington, D. C., for "Farmers' Bulletin 694," which gives full details. Mint is started by planting the roots of the right kind. There are varieties of mints which do not yield the desirable flavors. After establishment mint is grown as easily as alfalfa and the crop is handled with the same mowing and gathering machinery. The oil is secured with a very simple kind of still, consisting of any kind of a steam boiler, with covered wooden tanks fitted with proper valves and a tin "worm" in a condensing tank. But no one should go into mint growing without being sure of two things: first that he has the right plant, and second that he has found a customer for the oil. It is so easily produced that an over-supply is constantly threatened, and it is useless to think of growing the crop without having the oil-making adjunct provided for in some way.

Late Crops on Overflowed Land.

To the Editor: I have land subject to overflow. It is sometimes impossible to get on it until the middle of June. It has never been cropped, but an analysis of the soil shows the presence of all the necessary mineral plant foods. How late would it be practicable to plant milo maize, beans or Indian corn, on this land?—W. R. N., Davis.

It is perfectly practicable to plant sorghums of different kinds, beans and corn on such land when it gets into good working condition after overflow. The amount of growth of these tender plants will depend upon the date at which early autumn frosts arrive. It will require about 110 frostless days to get a seed-crop of corn or beans; some sorghums will come through faster. If, then, you are liable to get a frost in September or October, as is the case on some interior lowlands, there is a chance for losing-out. But if you have stock to feed green or by the use of a silo, you can use such land for sorghum and corn to advantage. As the land has not been cropped it is wise to try in a small way at first with different plants to see if the soil is not sour or otherwise unready for production.

Pears or Dates for Alkali.

To the Editor: What variety of prunes and apricots are best for this locality; also the best time to plant? The land I want to put the prunes on is heavy black loam, and there are a couple of spots that show a little alkali. Would prunes do well on these spots, and if not, what kind of fertilizer would you suggest? What distance is considered the best to plant?—M. B. S., Hanford.

We would not plant anything but pears and dates on land suspected of being alkaline, and we would not plant even those fruits where either the suspicion or the alkali were too strong. On sweet land in your district the Royal, Blenheim and Tilton apricots are most likely to do well, and for heavy land they ought to be on myrobalan roots. The same is true of the French prune, which is the only one we would plant except as an experiment. If the alkali is not too strong, gypsum will take the edge off from it, but the only cure is underdrainage and fresh water on top to wash it into the drains. The fruits mentioned can be planted at 24 or 28 feet distances.

Vegetables for Winter Growth.

To the Editor: I take your valuable paper for the benefit of the Eighth Grade of the Campbell Grammar School, and they would like to know a list of vegetables that could be planted with success this time of the year in the open ground. Would you suggest rhubarb for a school garden plant? Where could we get our plants? Could we use the stems this spring?—W. B. K., Campbell.

It is easier to say what not to plant now for the list is shorter. If you omit beans, corn, cucumbers, eggplant, melons, peppers and tomatoes, you can plant from this time onward all other vegetables which are commonly grown in field and garden. But to succeed now you need a soil which readily disposes of surplus water and your garden should not be in a low, very frosty place. Light frosts do not injure vegetables—except of the kinds mentioned above. Crimson winter rhubarb is growing freshly now in our garden, and unless the plants are so newly started that they need all their foliage for their own establishment. the stems are available all winter and spring. You can get plants from any of our seed and plant advertisers.

Quick Interpollenation System.

[Written for Pacific Rural Press.]

Interpollenation of different varieties of fruit is a difficult subject to determine accurately, and quite often the results of one or two experiments are refuted by other experiments.

An easy way to test out the value of different fruit varieties for pollenizing unproductive trees in one's locality was devised about ten years ago by Eugene Anderson of Contra Costa county. Instead of taking years to test it out by planting several varieties alternately, or of doing it a little quicker by grafting other varieties in, he took blooming branches from different vareties of trees and hung them into the trees which were not producing, and which he thought might need a certain kind of pollen. In order to keep these branches fresh until they should have matured their pollen and spread it abroad, he hung up old-fashioned fruit jars, which had wires across the tops, filled them with water, and set the branches in them.

He had already grafted all the other varieties that he could get in Contra Costa and Santa Clara valleys, with no success either by grafting single limbs or whole trees. But in testing out the use of blooming branches, he found a seedling tree in Alhambra Valley, along the railroad right-of-way. Two branches of that tree which were hung up in bottles in one tree of his own cherry orchard, seemed to do the work; for he got a crop on that tree, but none on any other in the orchard.

The tree from which he had taken the pollenizing branches was pulled out by the railroad company before it was propagated, so the only blossoms that would pollenate Mr. Anderson's orchard were lost, and the orchard has been pulled out.

Experiment Started Others.—But Mr. Anderson had taken time to write his experiences for the Pacific Rural Press, and Percy Douglas, who is now Horticultural Inspector in that section, read the article. He had a plum tree from which he had never gotten a taste. Mr. Anderson's suggestion in the Pacific Rural Press seemed easy to carry out, so he suspended branches of other varieties of plums to the tree and got a crop of fruit. As it happened, the fruit was no good, and Mr. Douglas remarks that was why it had never borne. However, the experiment enabled him to pull it out and replant with a good variety.

POMEGRANATES IN TULARE COUNTY.

To the Editor: Will you kindly give facts about pomegranate growing in eastern Tulare county. At what distances apart are they planted and which is the best variety?—Reader.

[Answered by E. W. Killian of Exeter.]

Complying with your request that I answer these questions, I will give you the facts as I got them from Mr. Buck, foreman of the Merryman Ranch.

They have five acres of Ruby pomegranate trees, about ten years old. One acre of this is on sand and amounts to practically nothing.

The trees are planted 22 feet apart. The fruits are packed in half orange boxes—each box holding about 36 fruits. Heretofore they have marketed them, by putting a few boxes of fruit in each car of oranges. This year they sent one car to the Chicago and one to the New York auction. Last year they realized $2200 from the crop and this year they expect to realize $2600.

The Ruby is the best variety for the market because of its rich red color. The Mission variety is the best to eat, but is not marketable because of its poor appearance. There may be a market for a limited amount, but I personally would not care to plant them largely.

HUNGARIANS AND CAROBS.

To the Editor: "Old Subscriber" from Penryn should quit pruning his Hungarians. Ever since (for five years) I have let them grow, simply cutting out the suckers, they have never failed to bear a large crop.

Is there any information available regarding the varieties of carob trees (Ceretonia siliqua) grown in California? I planted several dozens of them two years ago and I am rather doubtful about the varieties sold by the California nurseries. At least, if the fruit (pods) exhibited at the Panama Exposition was a sample of the variety grown in the State it was a very poor one indeed, when compared with those that can be found in the European markets.—**A. Isaak,** Lincoln.

[Non-pruning usually helps fruit-setting, but you must do a lot of propping to keep your trees from breaking. Besides, if you are growing other plums how do you know that they are not being cross-pollinated and helped that way? As for carobs we doubt if much attention has been paid to varieties, but some one who has taken the trouble to import good varieties may write you about it if he chooses.—Editor.]

SELLING WALNUTS BY VARIETY.

[From address by Dr. L. D. Batchelor, U. of Cal. Expt. Sta.]

At the beginning of the walnut industry in this State, the walnut crop was sold ungraded as a general product, much the same as the Irishman's conception of "pigs is pigs." Today the seedlings are strictly graded, while some of the varieties, as the Franquette and Eureka, are sold under their varietal names. The Placentia is sold in an advance grade called "Budded." As the industry grows it will likely develop more and more away from the general product to the production and marketing of specific varieties. These varieties will doubtless become as well known among the consuming public as the Baldwin apple or the Elberta peach. As this progress takes place, the high quality nuts will become more and more in favor.

Ten acres of table grape cuttings will be planted by E. H. Erickson of Brawley this spring, in a field test for the government. There will be five acres of Maraville de Malaga, one of Black Monucca, one of Foster, one half of Muscat noir d'Hongrie, one half of Gollabie, one half of Albardiens, one half of Muscat Bonod and one of other varieteis.

The Law says
KILL 'EM

Did you know there's a California law compelling all persons to rid their land of ground squirrels? But law or no law, you're alive to the damage these pests do to crops and trees and land. You want a cheap, easy way to fight them.

KILMOL
SQUIRLGOPHENE
Will Kill 'Em All

It is simple, sure, quick and practical. Saturate a waste ball in Kilmol, place it in burrow and after 3 or 4 minutes ignite. The deadly fumes remain in the burrow for hours—the rodent can't escape. 100 per cent efficient. Results guaranteed or money refunded. Used by Government, State and County officials. **Get Kilmol from your dealer.** Also waste balls better and cheaper than home-made. Also ask him about new U. S. Government formula of poisoned barley. Write for interesting information about squirrel and gopher eradication.

KILMOL SQUIRLGOPHENE
Kilmol in the United States Destructor Gives 100% Efficiency. Invented by U. S. officials.

Augur Shows Water Table.

[Written for Pacific Rural Press.]

"Irrigation is destroying the vineyard and fruit industry in the San Joaquin valley," says Frank Henry of Fresno county. "Years ago when the old orchards and vineyards were set out, the water table was 25 to 35 feet below the surface. The trees and vines had to send their roots deep and far to moisture and were greatly benefited by the experience.

"As irrigation became more general, the water table raised slowly and permanently, absolutely drowning and rotting the roots below the low point of the water table each season. New orchards being set out now simply send out root systems near the surface above the water table and thus grow well.

"Most growers will not believe the water table is so near the surface as an ordinary 2- or 3-inch auger will prove. They point to a pond of water on the place and figure the height of the water table from its surface, whereas the cultivation of the ground draws the table considerably higher than the surface of the pond."

In one alfalfa patch tested with an auger, the water table was far below that of a nearby pond, due to the deep roots and extensive transpiration of moisture by the alfalfa plants.

Water Table 2 Feet Instead of 15. —Flanders Setchel of Fresno has a vineyard five miles north of Reedley on which the vines on about 500 acres were turning more or less yellow and producing poor crops. Thinking the water table was at least 15 feet below the surface, an auger was used, showing so much water at 2 to 7 feet that the soil could not be brought to the surface. He has ditches running at intervals through the vineyard, through which water continually running sub-irrigates it. Since the water table was found so near the surface, he has been draining these ditches and sending irrigation around his place instead of through it. Within a month from the time he began this drainage in June, the vines were showing a greatly increased greenness and healthiness of foliage. Nevertheless, they were in such shape, the roots having been rotted off by the standing water, that a little later in the season they had to be irrigated in order to supply the surface roots which had by that time become rather dry. These surface roots will take to themselves moisture at the expense of the tops and will live through the dry season when the tops need water so badly that the leaves fall out.

These experiences would seem to indicate the need of definitely locating the water table in every vineyard and holding off the irrigation accordingly.

POLLINATING HUNGARIANS.

To the Editor: Replying to inquiry of Old Subscriber, Penryn, for some variety of plum that he may graft upon some of his Hungarians to make the remainder fruitful, will state that in a block of 1500 Hungarians in my orchard near Colfax there are about 20 Yellow Egg plums. For a distance of five trees from each Yellow Egg the Hungarians are unusually fruitful, bearing from ten to twenty times as much fruit as trees remote from the Yellow Eggs. The benefit of cross-pollination was conclusively proven. However, Yellow Egg is not a high-priced seller in the shipping markets, and (before I had definite knowledge of their dates of blossoming) I grafted occasional trees to Grand Duke and Giant, which bloom enough earlier than Hungarian to miss most of the bloom of the latter, thus improving the situation but little. French Prune is quite satisfactory as a pollinator, but Yellow Egg is ideal, the blooming period coinciding exactly with Hungarian. My suggestion to Old Subscriber is that he graft the fifth tree in every fifth row to Yellow Egg. This will reduce his Hungarian trees by four per cent numerically, but if his results are similar to my own he will increase his yield ten to twenty fold. I am becoming an ardent advocate of cross-pollination for most fruits. This year a block of cross-pollinated Bartletts in my orchard required thinning to such an extent that the ground beneath the trees was covered with the fruit, and an unusually heavy yield was harvested. The spring blossoming was no heavier than usual, but nearly every flower appeared to set a fruit. Foothill pear orchards are proverbially shy bearers, so, also, at times, are plums, and we need an exhaustive study of cross-pollination, taking into consideration various incidental conditions that promote or detract from heavy bearing.

A. L. Wisker.

Grass Valley.

THE GOVT. WILL MAKE A NUT REGISTER.

To the Editor: The Department of Agriculture desires to secure information concerning individual nut trees, either native or introduced, which bear nuts of such superior excellence as to justify special consideration.

The nuts which are of special interest at this time are the pecans and other American hickories, black walnuts, butternut, chestnut, and hazels, as well as foreign walnuts, chestnuts, and hazels (filberts). It is also desired to locate beechnut, chinquapin, and Japanest walnut trees of especial merit.

To be worthy of the attention of the Department, trees must be hardy in the section where found, vigorous, prolific, and annual bearers: The nuts must be medium size or above; uniform in size and shape; thin shelled, easily cracked; and the kernels plump, rich in quality, pleasant and agreeable in flavor, and easily removed from the broken shells in unbroken halves.

If the owner of such tree or trees is willing to co-operate in this inventory of nut trees the undersigned will be glad to send franked packing boxes in which to forward samples of the mature nuts from trees considered worthy of record.

C. A. Reed,
Nut-Culturist, U. S. Dept. of Agriculture.
Washington, D. C.

Tomato plants have grown several inches tall from seed planted last November between rows of three-year-old lemon trees, owned by E. Steiner of Brawley.

MORSE'S Grand Prize SEEDS for 1916

More Famous Than Ever

At the Panama-Pacific International Exposition, Morse's Seeds were awarded

9 Grand Prizes—7 Medals of Honor
14 Gold Medals

This is a record never before won by Seeds from any seed house in America. These honors were all awarded to exhibits of the products of Morse's Seeds, grown by C. C. Morse & Co.

Systematic Pomelo Pruning.

[Written for Pacific Rural Press.]

There is a pomelo orchard in Imperial Valley which has been making good money for its owner, Lou Farnsworth, but has grown full of brush and the lower branches dragged the ground, even since the fruit was off. Herman Brussow of Whittier, who has been pruning citrus trees 12 years, was engaged to prune the trees in February; and below are some of the pointers he suggested while busily restoring the trees to the possibility of increased crops.

Grapefruits, like Valencias, tend to bear heavily in alternate years. Prune while the trees are dormant in the winter before an off year. Go over a tree systematically three times. Where limbs are so low, it is necessary to get under, on your knees, and saw out enough to give the remainder good clearance from the ground, and take out everything low in the crotches. Inside fruit wood to be left above, will hang down in this space anyway, with the crop on. It is necessary to leave enough clearance for circulation of air under the tree and to cultivate closely so the ground will not sour.

The second time over the tree is pruned with long-handled clippers, also inside, and clearing out the low brush so you can stand up. Don't take out limbs that would leave holes in the side of the tree. Where it is a question which of two crowding limbs comes out, take the lower. Prune out all dead and crossing wood. Do not leave any twigs which would hang to the ground with fruit on.

Leafless twigs of fruit wood will have leaves and flowers shortly after irrigation, within a month, along in February here in Imperial. Don't cut them out, thinking they are dead.

Standing up for the last of the second inside pruning, you can locate the limbs that should still be cut much better than from the outside, though the third time over the tree will be from the outside.

Where much is being taken from the tree anyhow, leave all possible, to be pruned two years hence, to avoid too much shock by removal of leaves. Where it is a question whether to leave twigs under or on top of a limb, leave those on top, to grow upward so they may replace the end brush of that limb when it shall be taken off in the future.

It is better to cut two branches of a limb off in two different cuts than in one, because quite often in making the first cut the "picture develops" and shows the remaining branch to be needed on the tree.

Pull Suckers.—Suckers to be destroyed ought never to be sawed or clipped out. Neither should they be pulled out by pulling in one direction only, since that leaves an ugly wound in the bark. While pulling gently, the sucker should be worked back and forth to crack all sides somewhat loose from the bark and the sucker then be pulled out "by the roots." If it is cut off, you are likely to get four times as many new suckers as you have cut out.

NEEDS FROST POTS.

[Written for Pacific Rural Press.]

On the flat of a little ravine opening onto the seashore of Santa Cruz county, an acre or more of Bellflower apples were planted perhaps 15 years ago. They never bear much of a crop we were told, because frost gets the blossoms every spring. It was also said that that section raised the best apples in the State. For lack of investment in perhaps 100 cheap frost pots and oil, that acre of rich soil loses the opoprtunity every year of giving its owner a neat income; and the public eats poorer apples.

HONORS FOR REHART.

To the Editor: The Oregon weather prophet, Mr. Rehart, seems to have come through with an awful punch. Really I have followed him for about eight years and his predictions have always come true. He foretold both dry years and the following, when you seemed to think he missed it so badly. He most certainly was right in general, that the rainfall would be above normal and floods everywhere. Could you ask anything to work out better than his prophecy this year: no rain to speak of till December, then plenty? I think you would do well to copy his predictions and cater to the farmer's greatest weak spot, the "weather prophet" — that is, of course, providing he does not live in our own home town.

Dixon. Wesley W. Miller.

Celery growers in the vicinity of Holt, San Joaquin county, are said to be harvesting good crops of celery this season, the land yielding a carload to the acre.

Superior Northern Grown
TREES
Oregon grown trees have earned an enviable reputation in California. Many Inspectors have pronounced them the finest trees that come into their district. We have a limited surplus of the following:
PRUNES—
French on Myrobolan.
French on almond.
Imperial on almond.
Imperial on Myro.
Sugar on peach.
Sugar on almond.
APRICOTS—
Royal on Myro.
PEARS—
Bartlett. Anjou.
Clairgeau and other leading varieties.
These are all our No. 1 grade—strong, thrifty trees, good roots, clean and smooth. No cull trees that we are sluffing off at "bargain prices." Let us know your wants, now. Prompt shipment assured.

Apricots $250 an Acre.

[By E. H. Erickson, Brawley.]

Apricots in this valley cannot stand much alkali, but they can be grown on land where grapes will not do well, if it can be well drained. They like the good sandy land best.

There are three varieties which do well here—Newcastle, Blenheim, and Royal. I have found only the Newcastle and Blenheim profitable; and Newcastle is best because it comes in early when there is hardly any fruit in the market. I always start to pick some the first week in May and the picking lasts about three weeks.

Root-stock.—Apricots in this valley should not be grown on their own roots, which are too sensitive to alkali. I have found the peach root best. It can stand more alkali and drouth than the apricot root. The plum root is too slow a grower for the apricot here. It will not make a good union. As the growing season is so long here, the trees make a big growth and we have to prune heavy and top them back. Thinning fruit by hand is too expensive, so we must do the thinning at the same time we do the pruning. If the trees have too much fruit-bearing wood we cut out some of the extra wood when we prune. If too much fruit is left on one tree, the fruit will grow small and will not bring as good a price on the market.

Varieties.—The Newcastle is a cling, and cannot be used for anything except to be shipped as green fruit. But it is so fine flavored and early that it always sells well. It is small in comparison with canning varieties on the Coast, but it grows larger here than at any other place in California. With good culture, it will grow as large as the Royal. It is so well adapted to this Valley and climate, that I think it is one of the most profitable fruits for us. It ripens when weather is cool and pleasant to work in, and it is a fairly good shipper. I have had them in iced cars as long as five days and they were still good when they arrived at the market.

The Blenheim is one of the best shipping and canning apricots and is a freestone. It ripens late in May when the Newcastle is all gone and there is still a good market for 8 or 10 days before any quantity comes from the San Joaquin Valley. The first competition we have is Newcastles from around Bakersfield. They are so small and full of black smut that they will not hurt us much. But after that, the San Joaquin Valley starts to ship in large quantities and then we have to quit, as they can produce them a whole lot cheaper. They have much cheaper and better labor. The fruit is somewhat larger, but cannot compare with our fine flavored apricots here. Then we must can or dry the balance of our Blenheims, as we can sell them in our local markets.

The Royal does not set as well and will not grow as large as the Blenheim. They ripen at the same time. I have tried the Rogers peach, the Hemskirke, Tilton, and Moorpark. The trees do well but will not bear.

$250 per Acre.—I have never failed to make $250 per acre on my Newcastles, and I have made as high as $700 per acre in a single year. The apricots start to bear early here; you have some crop the third year after planting.

COMING ALMOND DISTRICT.

[Written for Pacific Rural Press.]

G. A. Nehrhood has been exhibiting a pile of heavy fine-flavored seedling almonds, part of 128 pounds produced on one old tree in a neglected orchard near Paso Robles.

That the marl subsoil of this district is a positive advantage for stone fruit trees and almonds in connection with the adobe nature of the soil, is maintained by Mr. Nehrhood, G. N. Talbot, and others who are proving their faith by extensive almond plantings.

But their marl, they explain, is different from the impervious soft rock called marl in many other sections. It drains water easily as was shown by Mr. Talbot when he dug a hole 2½ feet through soil and 3 feet into the underlying marl, trenched the hillside to drain into the hole, and a few hours after a storm found the marks of water showing that the hole had been full but had drained away.

The marl analyzes about 46 per cent carbonate of lime, and 3 per cent potash as nearly as Mr. Nehrhood could remember. The lime, leaching into the adobe, with characteristic action granulates the adobe, making it more drainable and easily worked.

Figures on almond acreage, present and to be planted this spring, were dug up by Dr. Victor Ward of the Chamber of Commerce about New Year's and published in the Paso Robles Press. They show over 2,000 acres of almonds already planted outside the Atascadero colony, and give the number of trees to be planted by each of 42 growers. They total nearly 76,000 trees to be set mostly in 27-foot triangles, 70 trees per acre.

The largest planters for next spring are G. N. Talbot 7,000 trees, Brown Bros. 5,000, Bowers Orchard tract 7,000, H. A. C. McPhail 7,900 and G. H. Aiken 7,000. Mr. Nehrhood already has 500 acres planted. Some of the trees coming four years old are 20 inches in circumference. No irrigation is practiced. Old almond trees in family orchards form the basis of their faith.

This is the answer the Paso Robles people wish given to the statements that their district is unfitted for almonds. They also proclaim by smaller plantings, their faith in that district for pears, apples, and walnuts.

MILO TWO CROPS PER SEASON.

[Written for Pacific Rural Press.]

Two crops of milo corn were grown last season by Mr. Schmeyser, near Holtville, Imperial county. The first of about one and one-half tons of grain was cut in July and August, the stalks soon mowed about three inches above ground and left lying. The field was irrigated and the second growth shot up so fast that the daily increase seemed noticeable. The second crop of grain, one and one-half tons per acre, was cut before the early mid-November frost of this year, and the stalks were cut later for fodder.

TREES

EVERY VARIETY

With our complete assortment of stock, grown under the most favorable conditions, we are prepared to give the very best of attention to all those who favor us with their business. Our packing and shipping facilities are unexcelled. No matter what you may figure on planting, it will pay you to "get Roeding's suggestions."

WALNUTS

Walnuts are a sure and profitable crop and we take pleasure in recommending them for the home grounds. We advise planting grafted walnuts only, and have a splendid stock of Franquette (Vrooman strain), Eureka, Placentia Perfection, etc.

Ask for quotations.

APPLES

Apples are a staple crop that you can always afford to plant, regardless of the local condition of the markets in any one year. Roeding's apple trees are conceded to be A-1. Let us quote you prices on such splendid varieties as Delicious, Gravenstein, Rome Beauty, Stayman's Winesap, etc.

PEACHES

Don't let people discourage you from planting peaches. When others hesitate the man with foresight realizes that is the time for him to plant. Our stock of peach trees is the finest we have ever grown. Ask us about our new varieties, the Libby and Peak Clings.

FIGS

The demand for Calimyrna dried figs has been growing far beyond our most sanguine expectations. Our stock is running low, but we can take care of orders for reasonable quantities. We are, however, headquarters and can also supply White Adriatic, Mission and other leading varieties.

Write us.

Send for Our Catalog

Our 1916 illustrated price catalog is the most complete that we have ever issued. We suggest that you send for a copy as its perusal will give you many ideas in reference to things to plant, both fruit and ornamental. Sit down and write us for a copy right now.

Prune Men's Accomplishments and Aims.

In these columns last week we gave a report of the prune growers' meeting at San Jose, January 19, but did not attempt to give in detail either the work accomplished by the Prune Growers' Committee in 1915 or the immediate plan of action approved by the assemblage last week.

What Has Been Done.—The work that has been done was thoroughly outlined by the report of the Growers' Committee read at the meeting, which follows:

Poor Early Prices.—To the Growers of Santa Clara County and Visiting Counties: Early in the season of 1915 growers became aware that speculators were busily selling contracts to deliver the growers' prunes when cured at prices ruinously low to the grower.

We say contracts and not prunes, because at that time not only did the packers have no prunes to deliver, nor did the growers have any, as the trees were then only in blossom.

This finally roused the growers of the Cupertino Improvement club to the point of calling a mass meeting in 1915.

At this meeting statements were freely made that between 1000 and 1500 carloads of prunes had already been sold by speculators.

This was generally denied by the packing interests, but later the statements were found to be correct, as the facts upon investigation were proven absolutely. Many of the contracts were seen by a committee from us, appointed for this special purpose—and at prices lower even than was claimed.

Sold Too Cheap.—Later some of the packers admitted that others had done what was claimed, but denied having done so themselves. But it was only a short time after, when for reasons of necessity or otherwise, that they were playing the same game.

This means, Growers, that our prunes were being sold for 3½ and in some cases for less without good reason therefor, amounting to pure speculation. In support of these low prices the buyers claimed an immense crop of both prunes and apricots in Santa Clara valley especially, and that there would be no export trade in 1915 owing to the European war.

Packers' Figures Off.—Both of these claims were proven erroneous and virtually admitted in due course. The meeting developed the fact that there would be little if any more than 70,000,000 pounds of prunes and only about 65 per cent of the 1914 crop of apricots in this valley, and at no time did these figures prove overestimates.

It was unanimously voted to hold prunes for 5 cents; apricots, though not voted upon, were considered worth 8½ to 9 cents, although as low as 6 cents had been offered. And as you know prunes ultimately went to 5 cents, and the bulk of the apricots sold at 8 and 8½ cents.

Upon the suggestion of Mr. J. O. Hayes, a representative from each district was selected, constituting a growers' committee, to keep the growers informed on crop and market conditions. This duty they conscientiously performed to the full extent of their ability and opportunity. Much useful and valuable information was sent out to the growers through the medium of the press. The Mercury Herald, Pacific Rural Press and California Fruit News have been exceedingly generous with us in this respect.

Result of Reports.—Just what value these committee reports have been to you can be best determined by the results you obtained personally. But we know that many thousands of dollars were saved to those who had courage in themselves and confidence in the committee's advice that otherwise would have been lost.

Realizing that finances in the harvesting of crops would be a necessary factor, a sub-committee interviewed the banks of San Jose and found that, with one exception, they were all favorably inclined toward the growers' movement and, not only promised, but actually aided (in all cases where needed, as far as we know) the efforts of the growers to obtain a 5-cent prune basis.

In addition to this, we sincerely believe that the committee's efforts during the year of 1915 have received the moral influence and general respect of the business men of San Jose and Santa Clara county.

In regard to finances, the mass meeting of last May overlooked this possible necessity. For this reason our work was more limited and information less widely distributed than it otherwise would have been. As it was, we kept in close touch with such nearby counties as Napa, Sonoma, Tulare and Contra Costa and exchanged valuable information with them.

By the courtesy of Mr. E. A. Wilcox of San Jose, who was identified with a previous growers' association organized for the purpose of disseminating information to the growers on similar lines to our committee, a fund of $21.75, balance in his hands was placed at our service, which money practically carried us through to the expense of this mass meeting, for which we thank him.

Jos. H. Bone, Chairman,
H. O. H. Shelley, Secretary.

What Will Be Done.—The tentative plan for the work in 1916 was outlined by Mr. Geo. E. Merrill in this manner:

The 1915 growers' committee by its services during the past year has proved itself of great value to the industry in which we gain our living. Its members realize, however, that the success of the committee, although vital and important, has been but partial; the majority of the growers did not act on its advice. That they did not act on the good advice given was largely because they did not know of it, or if they knew of it they did not appraise it at its true value. The ordinary means of publicity, including both the daily and agricultural press, do not reach all or nearly all of the growers, and not all of those who can be reached by these means appreciate the true worth of such reports as were put out by the growers' committee.

The members of the committee are aware of these conditions, and also of the need of more comprehensive and timely information than they were able to obtain with their necessarily informal and imperfect news-gathering facilities of last year. They have therefore considered the necessity of a better means of ascertaining and disseminating the facts relating to market and crop conditions throughout the year.

May be Bigger.—As a result of their deliberations there has been evolved the tentative scheme of state-wide organization that I have been asked to present to this convention. The scheme does not contemplate the formation of a growers' marketing agency, state-wide in its extent. An agency of this sort may or may not in future years become advisable. If it does become advisable, the California prune and apricot growers' information bureau will have paved the way for it.

"Our scheme may not realize the ideals of all growers assembled here, but at least we hope that all will regard it as a step in the right direction. In our deliberations as a committee we have aimed to build a foundation on which may be raised a structure that will not be assailed by other rural organizations already in the field; one that will not arouse the united opposition of the packing and other vested interests, but one that will carry out in a fuller and completer manner the work so well begun by the 1915 growers' committee, and in addition to this pave the way for the solution of any problems that now confront the industry or that may face it in the future. Our plan has already received the en-

dorsement of the grange and of the Farmers' Educational and Co-operative Union, and the delegates of other growers' organizations who are meeting with us today have given it their heartiest approval.

Present Plans Outlined. — "Although the gathering and disseminating of market and crop information is the prime object of the proposed association, it is hoped that other lines of work may be developed. The successful conduct of these other lines of work depends on a comprehensive knowledge of the conditions involved. There is at present no feasible method of securing this knowledge except through some such organization as the one we hope will be formed from the action of this convention.

"Perhaps the most important direct result that can be looked for from our proposed association is a stabilizing effect on prices. If each grower in the state is placed on an equal footing with the packer so far as knowledge of market and crop conditions is involved, it is plain that a short-selling bear campaign early in the season based on the growers' supposed ignorance is less likely to meet with success than one run under present conditions. In short, few packers would dare sell short if they knew the growers were acting as a unit in an effort to secure just returns. The successful application of our plan will increase the general level of prices to the producers, and make the business of the packer less precarious, which will ultimately result in better prices to the grower in so far as he helps now to make up the losses suffered by speculating operators in the dried fruit market."

KEEP SOIL COOL FOR BACTERIA.

[By Prof. C. B. Lipman, Berkeley.]

The activities of soil bacteria are profoundly influenced by the temperature conditions of the soil, air, and water. The optimum temperature for the development of most of them is about 86 degrees F. and they will yield their products, within certain limits, in amounts proportional to the rise or fall in temperature. This is particularly true of the organisms in the soil producing ammonia from organic nitrogen and nitrates and nitrates from ammonia, and also of those which fix nitrogen from the atmosphere.

We have it in our power to control for the benefit of the plants which we grow, the activities of bacteria in the soil by changing or modifying the temperature of the latter through certain methods of soil management.

Drainage and Tillage.—In the heavy soils, proper temperature for soil bacteria must be brought about, not only through good drainage, but through early tillage; because early tillage through a better circulation of warm air and the evaporation of excessive moisture; and therefore bring a larger and earlier development of bacteria. How important this early warming up of the soil is, when viewed from the standpoint of the soil bacteria and the soluble plant food produced by them, can be seen from the fact that even under the best conditions, we have so slow a natural formation of nitrates in the soil in the late winter and early spring that we are constrained to use soluble nitrogen fertilizers in order to tide the tree over the period during which the soil is warming up sufficiently so that the bacteria may produce a large enough supply of nitrates.

On the other hand, to protect organisms of the soil from the effects of intense heat, it is necessary to maintain constant summer cultivation to preserve the moisture content of the soil, which will tend to make more uniform and less intense the temperature of the soil, so that the bacteria may not be disturbed in their work. There can be but little doubt that the hot sun is responsible for the destruction of many of the soil bacteria in the surface. One of the reasons for the bacterial poverty of the soils of the Coachella and Imperial valleys and other desert districts is the great heat of the sun which is rapidly conducted through the sand particles and must be destructive to many of the organisms.

Through cultivation and the regulation of moisture by proper irrigation and drainage, we have it in our power to control the activities of the bacteria in the spring by raising the temperature, and in the summer by lowering the temperature.

Warm Irrigation Water.—We find in our investigations that the temperature of irrigation water is very important in the development of soil organisms; for example, ice water has a greatly depressing effect upon nitrifying and nitrogen fixing bacteria. This teaches an important practical lesson. Many of you know that a good part of the water supply for irrigation comes directly from the snow of the mountains. Without being allowed to become warm in reservoirs prior to use on the land, it lowers the temperature of the soil and therefore stops the activities of bacteria in the interests of the plant; to say nothing of the effects on the plant itself, a subject which we are now investigating at our experiment station. To overcome this difficulty and the evil effects which must sooner or later come from the use of very cold water for irrigation, I would recommend the construction of reservoirs in which this mountain water may be collected and warmed by the sun before it is passed through the ditches or the flumes for use on the land.

SHINGLING A DITCH.

[Written for Pacific Rural Press.]

Some of you who have had trouble with ditches cutting out, try this scheme.

"Shingling an irrigation ditch" is a term used in Owens River Valley to mean putting hay in the bottom of the ditch to keep it from washing. Sounds easy, but care is always taken to get the job done right.

First, oats (barley may be used) are sown on the ditch sides and bottom. Then enough hay is thrown in to make a layer three or four inches thick, on both sides and bottom. A little sand or dirt is thrown on top to help hold the hay in place. Now a little stream of water is turned in to help settle the hay and sprout the oats. Pretty soon the oats grow up through the hay, thus binding it fast. Now you are ready to turn in a little more water. Gradually increase until you are running the ditch full.

Sandy and peat soils are typical of California. They are generally lacking in phosphorous and potassium. **Gold Bear** fertilizers are rich in these elements because they are especially manufactured for California conditions. There is a booklet on fertilizers, we would like to send to you. Write for it.

Why State Should Help in Marketing.

[Written for Pacific Rural Press.]

An Open Letter to Colonel John P. Irish.

My dear Colonel: My attention has just been called to an article published in the issue of the Pacific Rural Press of January 22nd, 1916, in which, among other things, you say:

"The proposition of Mr. Weinstock that farm products shall be officially handled, routed, shipped, stored and sold is one that also treats the farmer as a poor dependent creature incapable of attending to his own business. It has been shown that producers are entirely capable of co-operating, shipping, routing, and selling, and all classes of rural producers should be encouraged to follow this example rather than to use Abraham's bosom for a pillow and let the most important part of their business be attended to by any one of many political machines."

It is quite evident from the foregoing that you are not as well informed as you might be on the situation that confronts the producer of California's perishable products. The fact is, as you can easily ascertain by taking the trouble to inquire from shippers and growers who can speak out of bitter experience, that they have not been able on a sufficiently large scale to co-operate in shipping, routing and selling their perishable products. Let us take the citrus growers' experience for example. The Citrus Growers' Association controls about 62 per cent of the crop. Despite the able management of the Association; despite all its scientific methods of preparing the fruit for market; despite its best judgment in fixing quotas of supplies for various eastern marketing points with the end in view of giving each market its fullest quota of citrus products up to its maximum consumption, both gluts and famines have more or less prevailed at frequent periods due to the fact that the remaining 38 per cent of the fruit has been shipped, as it were, in the dark, to the various eastern points, causing gluts and famines to the injury of the whole 100 per cent.

You say that it has been shown here that producers are entirely capable of co-operating, shipping, routing and selling. If you will take up the matter with the California Fruit Distributors who, themselves, do the shipping and routing of deciduous fruits, you will find that the same situation that I have just described for the citrus industries prevails in the deciduous fruit industry, only in a worse degree.

The fact remains that up to this time in the long history of California eastern fruit shipping it has not been possible to have either the growers or the shippers collectively control intelligently the routing and direction of the fruit so that gluts and famines might be avoided, and this is due largely to the human equation involved which causes more or less jealousies and rivalries and lack of human confidence and the fear that one will "put it over on the other" and so on. The only agency that can minimize these feelings and can succeed in controlling the fruit as a unit is the agency of the State, where such agency has the confidence of the growers and shippers generally. If the State Commission Market were purely a political proposition and managed by a ward heeler or a political henchman there might be some force to your contention that the grower should not be made the victim of a political machine; but my long and more or less intimate relationship with you will enable you to say whether, in your opinion, the State Commission Market is presided over by a ward heeler or a political henchman.

If the producer is all sufficient to manage his own marketing problems, it would be interesting to learn why it is that in a letter to this department under date of January 8th, you write as follows:

"When my onions are waiting on the levee for a price equal to 8-10 of a cent a pound, the consumer is phoning the store to send him 25c worth of onions, and he gets three pounds, or 8 1-3c a pound. If I should ship down a carload and advertise for the consumer to come and take them away at 80c per sack of 105 lbs. I would not sell two sacks.

"It is the same with potatoes, for which the consumer pays 2½c a pound, but he would not buy of me by the sack at $1.25, or about 1c a pound.

"This, too, is the reason why the so-called free market failed in San Francisco and most of our cities. The consumer wants most of his stuff 'sent up,' and thinks that delivery to his kitchen door costs him nothing.

"The newspapers are aflame with the great profits and prosperity of the California farmer. I have been one for years and I know land and its use, for I was brought up on it, and I make a modest living only."

If, as you say, the producers are entirely capable of co-operating in shipping, routing and selling, how do you explain the fact that you are only getting 8-10c a pound for onions for which you tell us the consumer pays 8 1-3c a pound?

I have always regarded you as a man of rare mentality and uncommon ability and energy, and a leader among men. With all these valuable qualities at your command, how comes it that despite the fact that California has been an agricultural state for these many decades and that you have been a producer, as you say, for years, that you have not been able, either individually or in co-operation with your fellow-producers, to remedy the very serious situation which you describe? If, as you say, the farmer is not a poor dependent creature, incapable of attending to his own business, and if again, as you say, it has been shown that the producers are entirely capable of co-operating, shipping, routing and selling all classes of rural products—why is it that the consumer, according to your statement, is paying $166 a ton for your onions while you are only getting $16.00 a ton? As an onion grower you surely could not be blamed for writing of these things with tears in your eyes.

Someone has pointed out that our only guide for the future is the experience of the past, and judging from the experience of the past, if

PLANT TREES NOW!

Plenty of rain; a perfect stand of trees can easily be gotten if good nursery stock is planted early.

ETC., ETC.

What do you need?

Wire us a list of nursery stock needed. We quote and ship same day if necessary. Catalog on request.

KIRKMAN NURSERIES
Fresno California

you and your fellow-producers are left to your own resources, you are no more likely to be able to get more than $16.00 a ton for what you say the consumer is called upon to pay $166.00 per ton than you have been in the past. Don't you think that in the interest of the producers and the consumers and for the welfare of the state that it is about time that the state took a hand in the situation in the hope of lessening this tremendous gap of $16.00 a ton received by the producer for onions and $166 a ton paid by the consumer.

You, in common with your fellow-producers, have had all these decades in which to do this, and according to your own statement you have lamentably failed. It is quite possible that the state may also fail, but if it does, the condition surely can be no worse than you tell us it is now. Yours very truly,

Harris Weinstock,
State Market Director.

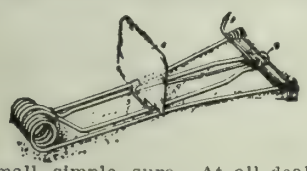
Cheap Money; Small Farmers

To the Editor: Some time ago I inquired of you if a federal rural credit system, making farm loans at low interest, might not lead capital to enter agriculture more than heretofore, and eventually crowd the small farmer out of business. Your reply, in your issue of Dec. 11, I did not find convincing. I am writing, not for argument's sake, but to get at the facts. If there are errors in the statements I am about to make I shall be glad to have them pointed out.

You claim that capitalists will not go into agriculture because the "great captains are too busy to farm." A few years ago one of the largest pork packers of Chicago established a model chicken farm to supply chickens for his packing plant. Recently I have been reliably informed that a large canning company of Santa Clara county is buying up orchards. These are indications of one form of activity of capital in agriculture. Another is landlordism and tenantry.

You argue that "as land values increase and taxes multiply we shall be farther and farther away from tenantry." It appears plain to me that an increase in land values makes the land more difficult to obtain by the average man, and that he is therefore forced to become a renter. Now, what are the statistics on tenantry in the United States?

In Indiana, Illinois and Iowa, states where land values are high, 30,000 farms disappeared between 1900 and 1910. For fifty years previous to 1900, the number of farms had been increasing, but during those ten years the consolidation of farms wiped out 30,000 farms. In 1910 there were 10,000 less farms operated by owners, in Iowa, than in 1900, in Indiana 8,000 less, in Illinois 13,000 l ss, the decrease in the number of owners being greater than in the number of farms. In 1880 sixty-nine per cent of the farms in Illinois were operated by owners, and 31 per cent by tenants; in 1910, fifty-nine per cent by owners and forty-one per cent by tenants. In the south, tenant farming is even more noticeable. In Texas, Louisiana and Oklahoma 55 per cent of the farmers are tenants, in South Carolina 63 per cent, and everywhere the proportion is reported to be rapidly increasing.



It would take too long to go into the question of the shoe-factory worker's changed conditions, but one fact is undeniable. He does not "own his job." In other words, he is not independent, however capable or industrious he may be. Shoe factories have their dull periods every year, during which time the shoe-worker is of necessity out of work and out of wages. The old shoemaker could always command work and a livelihood.

The farmer often clings to his little farm and his grinding toil because he is "his own boss." That is worth something to any man. That is why we want to know what sort of a scheme our dear friends in Congress are getting ready for us.

Modesto. **J. C. Macy.**

The Inyo Livestock Ass'n held a meeting at Lone Pine, Saturday, January 15, at which time the following officers were elected: J. H. Lubken, president; Frank Butler, vice-president; Mrs. E. H. Edwards, secretary and treasurer; an executive committee consisting of Frank Butler, S. H. Reynolds, Mark Lacy, Chas. Summers and J. H. Lubken was elected, and they in turn appointed an Advisory Board of themselves, excepting Frank Butler, J. C. Baxter taking his place on the Advisory Board.

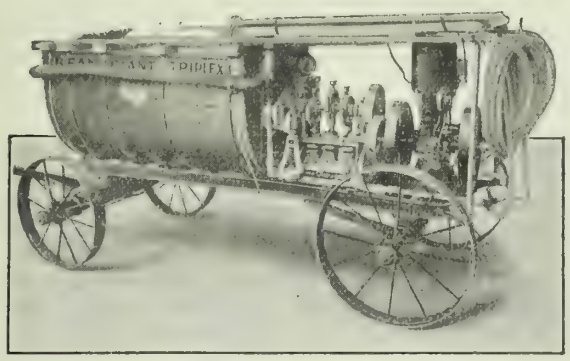
-hardy citrus trees



Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees—get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grapefruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

The "BEAN" for Results

A spraying outfit may have all the other virtues you might possibly think of—but if it doesn't drive the spray material onto the trees at heavy pressure, and if it doesn't keep up uniform work—it's a failure, and your time and money are largely wasted. The BEAN gets results. The sturdy Novo Engine and the Matchless Bean Pump drive the material on at tremendous pressure—so that it reaches every crack and crevice—and does the work thoroughly and completely. You should become familiar with the

10 Big Distinctive Features

This is the Bean Magic, the only hand pump that can be continuously operated at 120 lbs. pressure by one man without exhaustion. Porcelain-lined Cylinders, Ball Valves, and Bean Quality all the way through.

that gives the Bean its prominence. You should know about Bean Porcelain-lined Cylinders, the Bean Pressure Regulator, the Pump without a Stuffing Box, Bean Underneath Suction, the Bean Re-filler, Bean Eccentrics, the Bean Rocking Bolster, Bean Direct-connected Engine and Pump, Bean Interchangeable Parts, and

Bean Threadless Ball Valves

—the valves that cut sprayer troubles in half. Simply bell metal balls revolving on reversible and interchangeable brass seats. No threads to rust, corrode, or stick tight. Can be opened up entirely in less than 2 minutes without lowering the pressure, without stopping the engine, without drawing the liquid from the pump.

Tomatoes Without Blossom End Rot.

[Written for Pacific Rural Press.]

In addition to our comments on "Blossom End Rot of Tomatoes" in our issue of December 18, Wm. Proctor Spaulding, writing from Los Molinos, says: "After some considerable trouble and experimenting along this line, in 1913, the trouble was entirely eliminated in my tomato plants and I raised over 5,000.

"I started in by planting the seed in the usual way and when the little plants were two to three inches high —the weather conditions promising —I removed them from the seed bed, and transplanted in a bed prepared for them, in rows about ten inches apart, and the plants an inch or two apart, to permit plenty of light and air to each individual plant; and allowed no shade to interfere with sunlight and air and, as the plants grew to about twice the size they were at transplanting time, I again transplanted them, until this had been done four times, each time setting them a greater distance apart, so each plant would have plenty of room. light and air. Of course I kept them watered, before sun-up and after sun-down, as it seemed necessary.

"These plants never wilted seemingly for an instant after transplanting, but went right on growing into healthy, sturdy, stocky plants. However, should an occasional plant droop, I immediately removed it and filled the space it occupied with one that had no complaint to offer. About April 15 the plants were ready for their final planting.

"I utilized the top of my ditch banks for about 2,000 plants, setting them seven feet apart, and the balance of the 5,000 plants I put in rows six feet apart and hilled up, like sweet potato rows are 'way back east,' and these were also planted seven feet apart in the rows.

"At the time of setting out, the stocks were ⅜ to ½ inches thick, and very sturdy, and the color a dark rich green, a most healthy looking plant in every way, and most of them had lost their first blossoms. The plants were thoroughly inured to handling, wind, etc., and immediately began to grow as soon as work was finished.

"Much can be said in favor of a system of transplanting to insure strong, vigorous plants with vitality to throw off and overcome the various enemies to plant life, and produce firm, well developed fruit. Most people pamper their plants too much—like children and hot house plants—to make them sturdy, strong and healthy to bring the results desired.

"In 'hilling up' the rows, the fruit and blossoms can more readily be kept dry, and away from the water which is run in the furrow between the rows. My tomatoes have no worms, 'blossom end rot,' nor other defects. I have raised fully 60,000 pounds of fine, large, smooth tomatoes to the acre and never knew of 'blossom end rot' on a tomato from the entire 5,000 plants, or more. I have had 200 to 300 lugboxes of choice tomatoes ready for shipment at one time.

"After several years' trial of the treatment herein set forth, I am fully convinced it will give any one trying it the same good results I obtain. I raised three varieties: Burpee's Chalk Jewel, Stone and Perfection."

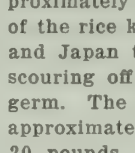
POINTS ON RICE MILLING.

Since there has been so much rice development in California in the past few years there has been a continual demand for information in relation to its growth, milling and its by-products.

In bulletin 330 of the U. S. Dept. of Agr. the following interesting points on milling are brought out. The rice grain as threshed is covered with a hard, siliceous hull. During the process of milling, the hull, the germ or embryo of the grain, six bran layers, and a portion of a seventh are removed.

The purpose of modern rice milling, in addition to freeing the grain from the hull, is to scour and grade it so as to produce a maximum amount of the highly polished rice which, on account of its bright luster, seems to appeal to the trade. The scouring process, to be effective in removing the bran layers, is so severe that a large proportion of the rice grains are broken. The weight of the individual grains is materially decreased and important chemical constituents are removed.

Rice of the Honduras type, when milled in a modern plant, is broken to an extent which reduces its whole-grain content from 75 per cent after hulling to 50 per cent after scouring. The Japan type of rice, on account of its shape, is broken to a less extent and, under similar conditions, averages 90 per cent and 80 per cent, respectively, in whole grains. Approximately 10 per cent of the weight of the rice kernels of both Honduras and Japan types is removed by the scouring off of the bran coat and germ. The milled yield of rice hulls approximates 30 pounds, of rice bran 20 pounds, and of rice polish 6 pounds per barrel of rice.



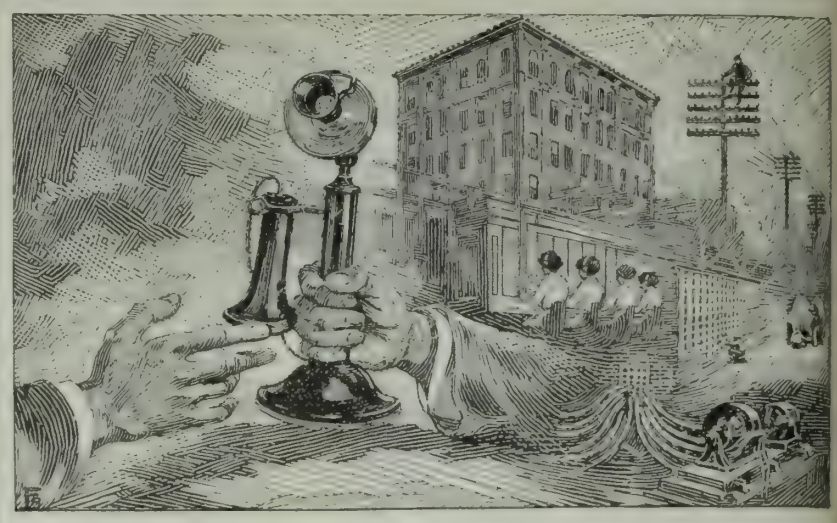
KILLS SQUIRRELS WITH GASOLINE.

[Written for Pacific Rural Press.]

For the last 15 years J. Nelson of Acampo has been destroying squirrels with gasoline and has found it very effective.

A rag, or anything that when balled will be nearly as big as one's fist, is thoroughly saturated with gasoline, then dropped into the squirrel hole. It should be packed back in the run with a stick at least two feet, then a bunch of weeds is stuffed in on top and lastly, at least 12 inches of dirt is tamped into the opening. The fumes from the gasoline kill the squirrels. This work can be done at times of the year when other work on the farm is not rushing.

C. J. Jacobson of Brawley, Imperial county, expects to plant 40 acres of figs, avocados, pomelos, grapes and apricots this year.



REDWOOD TANKS

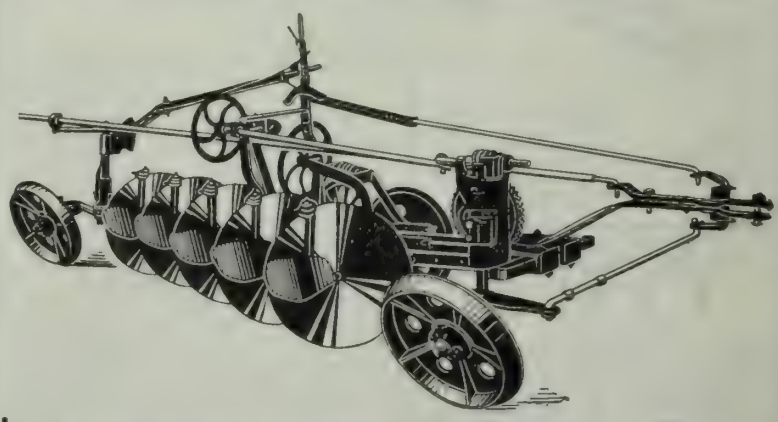
Anticipating Telephone Needs

When a new subscriber is handed his telephone, there is given over to his use a share in the pole lines, underground conduits and cables, switchboards, exchange buildings, and in every other part of the complex mechanism of the telephone plant.

It is obvious that this equipment could not be installed for each new connection. It would mean constantly rebuilding the plant, with enormous expense and delay. Therefore, practically everything but the telephone instrument must be in place at the time service is demanded.



Consider what this involves. The telephone company must forecast the needs of the public. It must calculate increases in population in city and country. It must figure the growth of business districts. It must estimate the number of possible telephone users and their approximate location everywhere.

The plant must be so designed that it may be added to in order to meet the estimated requirements of five, ten and even twenty years. And these additions must be ready in advance of the demand for them—as far in advance as it is economical to make them.

Thus, by constantly planning for the future and making expenditures for far-ahead requirements when they can be most advantageously made, the Bell System conserves the economic interest of the whole country while furnishing a telephone service which in its perfection is the model for all the world.

Knapp Engine Disc Plow

With this plow you can work within one foot of the trees in throwing the soil from the trees. Built very low, so that no part can come in contact with the limbs of the trees. Will penetrate hard soil and will not jump or swing around. Will turn under and completely cover up any cover crop or foul growth NO MATTER HOW HIGH OR HOW THICK.

WILL NOT CLOG UP IN PLOWING BURR CLOVER OR VETCH, as it has a wide clearance.

NO LEVERS to come in contact with limbs, as the land and furrow wheels are provided with worm-gear lifts, which does away with the levers and makes the plow easy to raise or lower.

TURNS EITHER TO RIGHT OR LEFT, and is steered by the engine as well as by hand.

The seat is in the center of the plow to keep the driver away from the trees, and all operating rods are within easy reach from the seat.

MADE IN ALL SIZES to suit every size and make of tractor.

WRITE FOR ILLUSTRATED FOLDER.

1022-1036 S. First Street San Jose, California

Control of Russian Thistle.

If all plants of the Russian thistle are kept from ripening seed before they are large enough to travel before the wind, the weed will not be hard to control on any farm, says H. S. Hammond, of the Oregon Agricultural College. He further says that if the plants are prevented from seeding for two years the pest will disappear. The essential point is not to permit any of the plants to mature seed, very particularly those plants large enough to roll. Care should be taken always to use pure seed and not allow Russian thistle to be introduced as an impurity in clover, alfalfa, and flax seed.

Since the plant is an annual and grows from the seed each year the young plants are easily killed by means of a hoe, cultivator or any other tool that will uproot or seriously disturb them. They are easily pulled up and when turned under with a plow they die.

The plant is spread chiefly by the wind, by which means alone it may scatter over five or ten miles of open country in a single season. The plants are also scattered by attaching themselves to brake rods and the locomotives of railway trains, and are carried in the bedding of the stock cars.

It frequently takes possession of a field to the exclusion of more useful plants and draws from the soil a large amount of nourishment that might otherwise be used by useful plants. Its special characteristics make it much more troublesome than most other weeds. Because of its strong, sharp spines as it nears maturity it frequently damages the legs of horses driven through clumps in the field. In some parts of the United States farmers have found it necessary to bind the horses' legs with leather when working them in fields infested with thistle. Horses running free on the open range are injured by having the skin lacerated, the spine breaking off under the skin and causing festering sores.

The Russian thistle grows to a height of 6 inches to three feet, branches profusely and when not crowded forms a dense, bush-like plant two to six feet in diameter. When young it is very tender and juicy with small, narrow, downy green leaves. As dry weather approaches the tender leaves wither and fall and hard, stiff branchs begin to form. These branches instead of bearing leaves bear three sharp spines at intervals of approximately one-half inch.

At the earliest frost the plants change in color from dark green to crimson or almost magneta, especially in exposed places. By this time the plant has a very dense yet light growth of circular or hemispherical form, and when the ground becomes frozen and the winds blow across the prairie or range the plant is broken off or pulled out and goes rolling across the field at racing speed, scattering seed at every bound and stopping only when the wind goes down or when stopped by fences against which it is blown.

QUESTIONS ABOUT POSTAL SAVINGS.

To the Editor: Is it not singular that the U. S. Government would shut their eyes and allow our wage-earning, faithful toilers to deposit their earnings in the postal savings banks at two and one-quarter per cent interest, and then allow these postal banks to turn these earnings over to national banks at two and three-quarters per cent, and then allow these national banks to charge our farmers 7 and 8 per cent on farm mortgages, for the savings of their own community?

Surely the banks are not entitled to more than the real depositor, out of these loans, for merely handling the depositors' cash!

Why could not the postal banks pay the toiling wage-earner, say 3½ per cent on his savings; establish a loaning system which could be most efficiently run for one-half of one per cent and loan the toilers' money out on farm mortgages at 4 per cent? It would pay the wage earner more and would enable the farmer to feed him cheaper. It would enable many a young couple to turn their efforts towards a little country home ranch. It would draw large capital towards agricultural interests. If our postal savings banks can take a national bank's security for its deposits, surely there can be no question as to farm mortgages for security. Land is above business risk and the last and best of all securities. **E. W. Bentley.**

Napa.

[Our reader's questions are involved in legislation now before Congress. Wait and see what they do with them.—Editors.]

PERMANENT ROAD WORK.

Money invested in right-of-way, in reducing grades to a proper maximum, and in draining and crowning a road bed and building suitable culverts and drainage structures, represents the most nearly permanent elements that enter into road construction, said Professor G. V. Skelton of the Agricultural College Highway Engineering department in speaking before Oregon farmers and road officers. He emphasized the necessity of giving due care to proper location, grades, drainage and the type of construction of different purpose roads, no matter what type of construction is to be adopted. Money spent for these items properly designed, represents permanent road construction, since these points would have to be cared for, now or in the future, no matter what type of construction is used. Gravel placed on a properly located, graded and drained road will often answer all immediate needs of that road and form the best foundation possible for a higher type of construction when that stage is reached.

At a meeting of the Farmers' Union in San Jose last week, Prof. A. V. Stubenrauch of the pomological department of the University of California advised those present that the university is anxious to aid in increasing the prune production of the Santa Clara valley through better cultural methods.

Toughest where the Strain is Heaviest

There is not a weak spot in the "Big Bull." The crank shaft is extra large, the connecting rod bearings extra long, to insure sturdiness, dependability and durability.

Another instance of the new standard of efficiency set by

"BIG BULL" Tractors

is the patent steer wheel, running in the furrow in line with the single pulley wheel, making them positively and automatically self-steering.

The "Big Bull" direct drive of only four gears eliminates complicated transmission and troublesome compensating gears.

Back of the "Big Bull" guarantee is an unusual service and a record of successful operation on more than 7000 farms. Before you decide to buy ANY tractor, get our Tractor Book.

General Agricultural Review.

DECIDUOUS FRUITS AND NUTS.

W. J. Stevens has been delegated by the State Marketing Commission to take a tree census of the various fruit orchards in Contra Costa Co.

The manager of a fruit and produce company at Spokane, Wash., was fined $500 last week for billing a mixed carload of boxed and bulk apples as bulk apples.

The Libby, McNeill and Libby company shipped 7,000 cases of canned peaches from their canneries at Selma last week. The shipment will go to Europe.

A report from Gridley states that 50 acres of pears are to be planted on the Charles Silva ranch this year. The land is bottom land and especially suited to pears.

Due to the low price of trees and the faith they have in the future of the markets, many farmers in the vicinity of Yuba City are said to be planting peach trees this year.

A complete change of officers and management was made at the annual meeting of the San Fernando Nursery Co., last week. W. J. Mann was elected president and manager.

The last carload of almonds in the warehouse of the Guinda Almond Growers' Ass'n was shipped from there last week. The association shipped over 200 carloads of almonds during the past season.

W. E. Packard of the University Experiment Station in Imperial Valley estimates that there are about 25,000 acres of land under irrigation there, suited to deciduous fruit culture. The "hard" land is not, because it makes the fruit ripen too late.

Fruit jobbers from all over the United States are said to look with favor on the recently organized peach association. A letter has been received at Fresno from Alaska in which the writer states that there is a good opportunity for developing the peach market in that territory.

The trustees of the California Peach Growers' Ass'n selected the following directors at their meeting January 21: William Glass, J. F. Niswander, Chris Jorgensen, all of Fresno; John C. Rorden, Selma; F. H. Wilson, Dinuba; W. J. Wilson, Hanford, and Warren H. Woods, Suisun.

Nurserymen in San Joaquin county report that the demand for almond trees is exceptionally heavy there this year, there being about three times as many almonds sold as any other trees. Confidence is expressed in the success of the California Almond Growers' Ass'n to handle the crops in the future.

The California Peach Association will provide for the cling peach growers of the State as well as the dried fruit men, according to a dispatch from Fresno. The contract with these growers will provide that the cling men sign up their peaches at a minimum price to the association with the privilege of selling independently outside if they are offered a higher price.

Writing to this office from Lancaster, Donald H. Graham says: "The storms have stopped most of the farm work in this valley, but during the next month many hundred acres will be planted to orchards. Pears will predominate. More grain is being put in this winter than ever before and the sugar company at Oxnard is planning to assist the farmers of the valley to plant 100 or more acres to sugar beets as an experiment."

CITRUS AND SEMI-TROPICAL.

Ten acres of grapefruit and five of dates are to be planted by F. D. Hevender of El Centro this spring.

A new olive pickling and oil plant will be erected soon at Oroville by Messrs. Meek, Gray and Perry of that place.

G. D. Parker of Esparto, Yolo county, will add 200 more Washington navel trees to his orchard of 300 trees near that town.

One hundred and twenty-five Eureka lemons on an orchard tree planted less than three years ago were picked last year by E. Steiner of Brawley.

A report from Oroville states that a company known as the California Estate Co. is sub-dividing a 500-acre tract in Butte county where water will be developed and a large olive acreage planted.

Shipments of citrus fruits from Redlands have not been so heavy as they were at this time last year, the total shipments for the season, to January 19, being 314 cars as compared to 551 cars a year ago.

According to W. S. Shippey of Porterville lemons from that section are remarkably good keepers. In some instances lemons from there have been kept as long as 16 months and it is nothing unusual for them to be kept for a year.

The 25th annual Citrus Fair at Cloverdale will be held February 18 to 22 this year. The committee in charge of finances report that there is plenty of money on hand and the fruit in that section is particularly fine for exhibition purposes.

G. V. Rude, manager for A. J. McPherrin of Imperial, says they will plant 40 acres to Marsh Seedless grapefruit this spring. Imperial Valley grapefruit compares most favorably with the Florida product.

Harris Weinstock, director of the State Market Commission, has sent out letters to 1700 olive growers over the State seeking their co-operation and advice on the formation of a marketing association to deal with the olive marketing problems.

The Ehman Olive company's 100 acre ranch near Lodi produced 150 tons of olives in 1915. It has been found that land on which alfalfa seeded was between trees and irrigated properly, produced more and better olives than the section of the orchard which was cultivated.

Shipments of citrus fruits from Riverside will be heavy as soon as the railroads are in shape to handle them, according to advices from there. Picking was started immediately after the rains of last week stopped. A total of 259 cars of oranges and 52 of lemons were shipped for the season up to January 21.

The Riverside Press gives its annual estimate on the citrus fruit and places the crop for Southern California at 39,450 carloads—32,000 carloads of oranges and 7,450 carloads of lemons. From north of the Tehachapi 5,300 carloads of oranges and 300 carloads of lemons, giving a grand total for the State of 45,050 carloads of citrus fruit.

FIELD CROPS.

A campaign against the Russian thistle will be started on the Phelan ranch in Butte county at once.

Arkelian Bros. have 2,000 acres of cantaloupes in Imperial Valley, according to their manager M. Manoogian.

A large number of the Japanese berry growers in the vicinity of Watsonville will raise beans the coming year.

A report from Kings City says that C. M. Hanson will plant 47 acres of alfalfa on his ranch near there this year.

Christiansen, Bumeister and Sevelon will plant 1500 acres in Natomas Consolidated District, 1000 to rice, the coming season.

Announcement was made last week at San Diego that a new sugar beet factory will be erected at that place in the very near future.

A report from Yuba City states that B. Cooper, a successful rice grower from Gridley, will plant a large acreage of rice the coming season on land near Encinal and Live Oak.

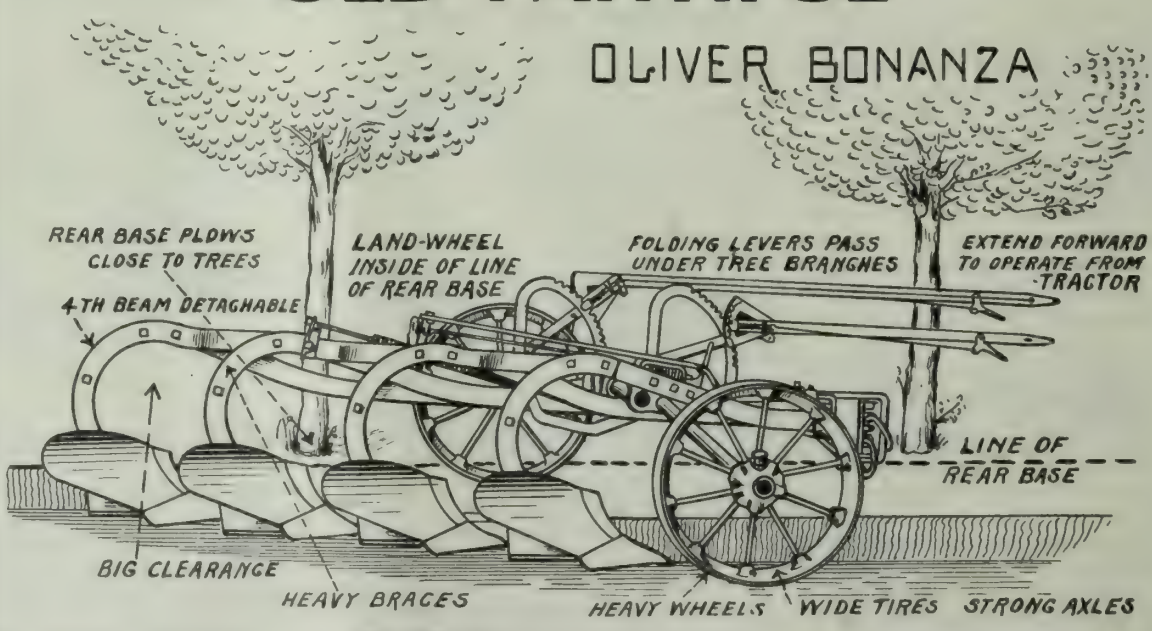
The Pacific Rice Growers Ass'n have asked aid from the State Commission Market in financing their crop. Col. Weinstock has written to New York and Washington for advice.

The Escondido Vegetable Growers' Ass'n of San Diego county are endeavoring to get enough farmers to plant tomatoes this year to make a total of 900 acres. About 200 acres were planted as an experiment last year.

Twelve carloads of hops were shipped from Chico last week, mostly to England. A dispatch states that there are now about 26,000 bales of hops in the Sacramento valley unsold.

The government has 1900 different varieties of wheat under observation at their experimental gardens at Chico. There are also about 600 varieties of grapes under cultivation at the same place.

Approximately three-quarter million eighty-pound sacks of lima beans are now stored in California according to reports from Ventura Two-thirds of this number are in warehouses in Ventura county.



A meeting of rice growers will be held at Sacramento, January 29, when a report of the special committee, appointed some time ago to look into legislation regarding water grass and other pests, will make their report.

The Rindge Land and Navigation company will plant 1,000 acres of sugar beets on some of their reclaimed delta lands in San Joaquin county. They also expect to increase their acreage of hemp from 400 to 1,000 acres this year.

The United Marketing Co. of Los Angeles is to build a cantaloupe packing shed at Brawley, 225 feet long and 30 feet wide. Melons will be received all along one side and trucked away from along the other side, packed for shipment.

A potato flour mill will soon be in operation on land owned by the Rindge Land and Navigation company near Stockton. It is expected that this mill will be an asset to the potato growers of that section as it will convert cull tubers into a valuable product.

"OLD FAITHFUL"

FEATURES:

Size—3, 4, or 5 Bottom, 10-inch cut.
Levers—Adjustable forward or backward, for tractor or horses.
Levers—Solid or folding, for Field or Orchard.
Bases—Chilled or Steel, for gritty or adobe soils.
Attachments—Rolling Coulters or jointers. supplied as extras.
Price—Reasonable. Extra Shares inexpensive.
Penetration—The Bonanza never shirks, always obedient to the owner's wishes.
Description—Write for more particulars of the California Ranchers' Dependable Plow.

The Oliver Combined Rolling Coulter and Jointer for Covering Trash and Insuring Good Plowing.

Oliver Chilled Plow Works

Los Angeles San Francisco

W. P. Carrol of the United Marketing Co. says that there are 8500 acres of cantaloupes being planted in Imperial Valley this year. The Cantaloupe Exchange organized to prevent the glutting of markets handled 4,468 cars last season while only 200 cars were handled by outsiders.

L. E. Clearman of Clovis is very enthusiastic over the Ettersburg strawberries sent out by the Pacific Rural Press three years ago. Last year, which was the second crop, the berries were very large, of deep red color and rich in flavor. Mr. Clearman states that he found that 14 of them weighed a pound. The largest one measured 5¾ inches in circumference.

An effort is being made by State Horticultural Commissioner Cook to get several potato growers in the Pajaro valley to grow certified potatoes this year. In order to be certified the potatoes must be inspected three times, during blossoming time, before harvesting and after harvesting. If they are found free of disease a seal of approval of the State is given the owner.

Potato growing on a larger scale is the slogan which is going the rounds in all sections adapted to spud growing. Meetings were held at Watsonville and Salinas last week at which places Horticultural Commissioner Cook, W. V. Shear, of the U. S. Dept. of Agr., Eugene Grubb, potato expert for the Southern Pacific railroad, and Mr. Phreaner, the champion potato grower of the State, talked to large audiences of farmers. The speakers all urged the growing of certified potatoes and told of the various pests and how best to avoid them.

VINES AND VINEYARDS.

A shipment of 50,000 gallons of wine was made last week by Frank Garatti of Pleasanton to Chicago dealers.

Advices from Fresno say that there were approximately twelve thousand tons of raisins shipped from the State in December, 1915,, which was one and a half times as many as were shipped during the same month in 1913 and 1914.

The 15-acre Thompson Seedless vineyard belonging to P. W. Brooks near Meloland, Imperial county, is to be increased to 35 acres the coming season. They are three weeks earlier than the Malagas according to Vahan Azhderian who handles the vineyard.

A new grape called Maraville de Malaga has been tried out by the government near Brawley with 214 other varieties and has proved much better on the hard alkali soil than the Spansh Malaga, whch is now the principal commercial grape of Imperial Valley.

MISCELLANEOUS.

In Egypt, horse beans are the only concentrate fed by many stockmen, who give some of the various straws as roughage.

It has been conservatively estimated by the government that the annual direct losses from animal diseases are approximately $212,000,000.

Lay Bros. of Winnemucca, Nevada, have recently received a carload of purebred bulls which will be used on their ranch in the Jackson mountains.

The Hobson Co. shipped four carloads of pulp cattle from Ventura to the Los Angeles market last week, which were said to be in prime condition.

Cattle came through the recent heavy storms in Humboldt county in good shape, according to advices from there, and the feed is in good condition.

David F. Lane was chosen general manager of the Turlock Merchants and Growers' Corporation at a meeting of the board of directors of that organization last week.

We have just received from the Portland Union Stock Yards Co., at Portland, a ver comprehensive report of the receipts and prices of livestock at that market during 1915.

1500 lb. G. M. C. model being used to haul oranges near Redlands, Cal.

A Truck to Fit Your Business

1500 lbs. GMC **to 5 Tons.**

TRUCKS

Don Lee now controls California for this line and the Don Lee organization stands back of the G. M. C. trucks. During the ten years this organization has been growing from a small sales house to a company with six branches and 50 agencies, the service given by Don Lee to owners has been winning a correspondingly high place in motor car circles.

The G. M. C. line fills all requirements. Whatever size or style your business requires there is a model to meet the requirements.

"Model 15"—All Purpose Truck

We invite prospective buyers to make comparison of the specifications of the G. M. C. Model 15 with any other 1500 lb. truck on the market.

The Model 15 is a rugged light truck, built for real truck service, and it will stand up and be a good truck long after those of lighter construction are out of service. For that reason we claim that the Model 15 is the cheapest 1500 lb. truck on the market—not the lowest in price, but the most economical.

Considering the quality our price is very low. The cost of upkeep is also very reasonable. The price of all the parts as priced in our parts list is but a little more than the price of the complete truck. Take the parts list of any other truck and figure the total cost of all the parts if bought singly and see what the cost would be.

In buying a truck there is a great deal more to be considered than the first cost. A very important point is the operating cost and the expense of upkeep.

It is very poor economy to save $200 to $500 on the purchase price of a truck and get one that with a little extra hard service will have to go to the repair shop, or, at best, will not last more than half as long as one that is built for hard service.

The time lost in the course of a year with a car that has to go to the repair shop frequently means much to the owner—it often means loss of trade. "Safety First" in haulage and delivery is just as important as anywhere else.

1¼, 1½ 2 Tons.

Worm Drive Modles

These models are the latest and highest type of motor trucks built by the pioneer builders of commercial cars.

Detailed specifications may be found in the catalogues published. A few of the more important features are as follows:

Continental motor, of heavy duty type, with a three-point support and in unit with the clutch and gear set. The idea of this is to keep the motor, clutch and gears in alignment at all times, regardless of the position of the wheels.

Transmission, Brown-Lipe, sliding gear, with four speeds forward and reverse. The low gear reductions give unusual pulling power.

The drive is known as "**David-Brown Timken Worm Drive,**" assuring simplicity, cleanliness, ease of adjustment and a less number of parts. Facts that are convincing over the old-style chain drive. The drive shaft is of solid chrome nickel steel of large diameter.

All bearings throughout G. M. C. trucks are Timken—the last word in bearings.

All frames are constructed of open hearth pressed steel and heat-treated. This adds to the long life of the truck, making the frame the same strength at one point as another.

Other Models

The new 3½ and 5-ton models will be here March 1. Either chain or worm drive.

Full line of electric trucks from 1000 pounds capacity to six tons. The electric trucks are particularly recommended for short hauls with frequent stops.

AND REMEMBER, when you buy a G. M. C. truck you are buying from one of the oldest builders of successful motor trucks, from the only concern in the world building a complete line of both gasoline and electric trucks; buying from a concern that is backed by unlimited capital, and which has branches and distributors all over the world; that you are insured of real service for years to come.

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

DREDGING IRRIGATION DITCHES.

The Colorado River steals a lot of fine Arizona soil and spreads it out over some 300,000,000 acres of Imperial county by means of irrigation water. Where the water is not kept constantly flowing fast enough, that Arizona soil settles in the bottom of the ditches and often entirely covers the outlet gates to fields. The main canals of each district must be dredged out three or four times a year at district expense.

A characteristic dredge is the one operated by W. R. Wright in Water District 6 near Signal Mountain. It is a Routh dredge built in the valley. Power is furnished by a 10 h.p. International gas engine both to dredge out the mud and quicksand, and to keep the dredge itself moving constantly forward on three broad wheels which run along the tops of the ditch banks.

The dredging is done by 10 metal buckets about 3½ feet center to center, on an endless chain which is run by a geared shaft from the engine. The end view of a bucket is the shape of a section of a circle with 16 inch radii. The buckets are over a foot wide with a cutting edge along the front and a loose back or bottom to hold the dirt. This loose bottom is dumped at the proper place by a projecting arm which catches on a fixed obstruction. The lower end of the chain of buckets may be raised or lowered at will with a set of pulleys operated from a hand wheel beside the engine. It dumps the wet dirt on top of the bank in front of an edgewise plank extending diagonally backward to scrape it over the edge and leave a smooth flat top on the bank.

A triangular channel-iron frame resting on the two wheels on the bank being dredged, supports the engine and operator's platform. An 8 inch iron pipe about 22 feet long extends across the ditch from this frame to a broad wheel on the other bank. This is held in line by a wire rope to the front end of the frame. The front wheel is steered by the operator with a handwheel.

The outfit is moved steadily ahead by means of a drum, geared into the engine, which winds up a wire cable hitched to a braced fence post set in the bank ahead. Another man lays timbers for the outfit to crossgates, shovels out a flat track on the bank for the wheels when necessary and does odd jobs.

The engine has three speeds. On low, she cleans about ¼ mile of one side of a ditch per day including stops for repairs, etc. In easier digging on intermediate speed, she travels twice as fast.

A PUMP GUARANTEE.

According to Prof. G. E. P. Smith of the University of Arizona there is a great deal of misrepresentation done by salesmen for new pump manufacturing concerns. He says that it frequently happens that an agent is willing to make a very high guarantee for his pump. Usually, however, the guarantees are of such a character that the purchaser cannot make the necessary tests. Even if the tests are possible, not one farmer in a hundred goes to the trouble to make them, and so the agent feels quite safe in taking long chances. The usual guarantee is for mechanical efficiency. But to test mechanical efficiency requires special apparatus and the services of an engineer. Purchasers should ask for a guarantee as follows:

"....gallons of water per minute on .... feet lift, with a fuel consumption not to exceed .... gallons an hour."

The standard pumps, reciprocating and centrifugal, have been brought to their perfection through slow evolution. Their merits are known, and it is far better to purchase machinery that is already proven than to experiment with untried machines on the strength of glittering promises and hot-air talk.

HOW MANY HORSES WILL TRACTOR DISPLACE.

To the Editor: If a tractor pulls 7500 pounds at the draw bar and the tractor is traveling two miles an hour, how many ordinary horses does it displace? What is the standard draft in pounds, that a horse pulls and can stand up to in a day?—F. H. A., Santa Paula.

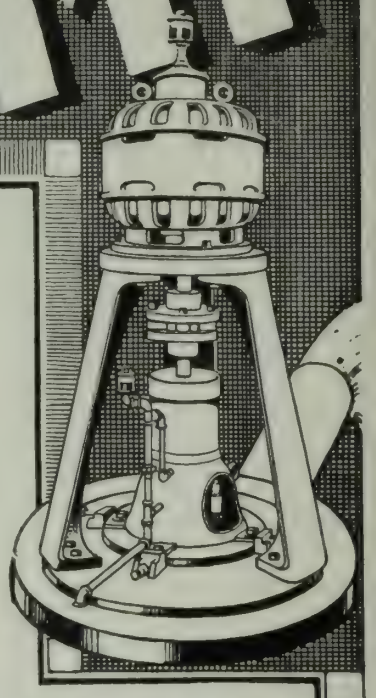
[Answered by Prof. J. B. Davidson, University Farm, Davis.]

A tractor exerting a pull of 7500 pounds on the draw bar and traveling two miles an hour would develop 40 tractive horse power,—the solution of the problem is as follows:

$$\frac{7500 \times 5280 \times 2}{60 \times 33{,}000} \text{ equals } 40 \text{ H. P.}$$

It is to be noted that there are 5280 feet in the mile and 33,000 foot pounds of work required in one minute for each horse power. A horse will exert under normal conditions for ten hours, a pull equal to about 1-10 of its weight. Thus this tractor would be equal to about fifty 1500 pound horses.

It is to be noted in this connection that a horse can for a very short time exert a much larger effort than that represented by 1-10 of its weight. On the other hand the gas tractor cannot be worked at its full capacity all of the time because part of its power must be reserved for the emergency. The tractor which would pull 7500 pounds continuously would be either working under very favorable conditions or else is a very large tractor.



HISTORY OF AXLE GREASE.

While lubricants have been used on axles ever since the first pair of wheels were carved out of wood, the axle grease of the present day is of comparatively recent manufacture.

Pacific Pipe Co.
Main and Howard Streets. San Francisco, Calif.

Probably the first lubricant of any kind to be used on axles was pure animal fat—quite similar in every respect to the grease the housewife of today uses in greasing her pans. This met the requirements of that day and generation — and indeed, it is still used in some parts of the world.

We need go no further than Cuba, or Central America where the big clumsy wooden-wheeled, ox-drawn carts are still in vogue. Each carreta, as they are called, carries a bottle of grease tied to the axle, so it will be handy when needed. Owing to the poor lubricating qualities of this tallow, the axles must be greased frequently.

Various kinds of oils have been used for axle lubrication, but for the reasons that they were too expensive, not heavy enough, etc., they have been discarded, notably castor oil, which is now prohibitive in price.

The ideal axle grease must embody these points—a good lubricant must not contain acids that will injure the axle; must be durable; of sufficient consistency to withstand the summer heat, and in wet and stormy weather during the winter, axle grease must be sufficiently adhesive (without being gummy) so that the water will not wash it from the axles. Flake graphite added in the manufacture to regular amber colored axle grease makes a combination which is particularly fitted to overcome moisture, and that is why a graphite axle grease is recommended during the winter months.

Although there are many cheap grades of axle grease on the market, the best brands which cost a trifle more are the only kind that have given satisfaction. Sensible purchasers realize that quality means more than price, and that cheap greases cost more in the end. For that reason, sales of high-grade axle greases are increasing every year.

TRACTOR VINE DIGGER.

[Written for Pacific Rural Press.]

A specially constructed grapevine digger was built for the large Stanford University Ranch vineyard in Tehama county by the Killefer Mfg. Co. of Los Angeles. It is to be pulled by two big Caterpillars. It will cut the vine roots and lift the vines high and loose enough so they may be pulled by hand. The machine weighs 7500 pounds. It consists of a channel iron frame eight or ten feet long, whose front end rests on a pair of heavy iron wheels high enough so the axle runs over the vines. The frame is pivoted so the rear end may be raised or lowered.

The rear end consists of a heavy iron U whose ends are pivoted at the rear corners of the frame so the U can swing forward or backward. From a point midway to the ground, on each leg of the U, a heavy iron bar slopes forward to a cross piece which connects them above the frame and to the rear of the front axle. This crosspiece is bored through the center and threaded for a heavy screw to work in. The screw is held by a crosspiece pivoted in a framework built on the main frame of the machine, and over the front axle. The screw is worked by means of a handspoked wheel by the operator who stands on a platform.

In the bottom of the U is a sharp edged shoe or plate which cuts the main roots of the vines. It slopes upward and backward to lift the vines and loosen the dirt about them. Two wing plates are fastened to the upper half of the U to guide it centerly under the vines.

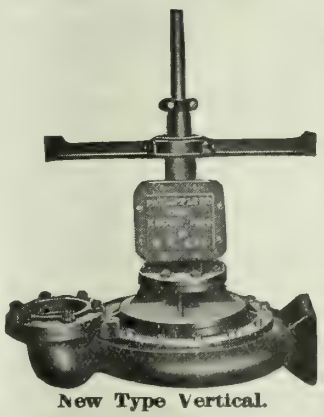
When the digger is to be worked, the screw wheel is turned to swing the U back and tilt it so it will run deep. Working the screw the other way levels the cutting shoe or slopes it the other way so it runs out of the ground. A pair of wheels on an axle are provided to hold the weight of the rear end while running on the road.

The machine was tested early in January and the following message wired to the company: "Grape stump plow great success."

MOTOR-PLOWS IN ENGLAND.

An English paper says: "One of our readers writes: 'I am on the save this winter, as I want to buy a motor-plough next year.' Another reports traveling with a party of farmers on their way to a county-town market. All were in a large way, and their talk was of motor ploughs which some had got, others had hired, or meant to obtain before another year. They had nothing but praise for the result, and agreed that the daily cost in gasoline was one dollar less than the keep of the 4 to 6 horses which it would take to do the work of the motor-plough."

POWER NOTES.



Between January 31 and February 12, the Holt Manufacturing Co. of Stockton will hold their second annual caterpillar school. Instruction at this school is free to owners of Caterpillars or to anyone to whom they may care to transfer their privilege. More than 100 have already enrolled for this instruction and it is expected that fully 200 will attende. F. L. Peterson, formerly with the University of California, and who conducted the school last year, will again be in charge. The work in the school includes lectures or ignition, valves, valve-grinding and valve-setting, carburetion, causes of carbon in cylinders, economical operation and many other subjects directly related to the motor. In addition, lectures on the various adjustments of the caterpillar—clutches, transmission, track, etc.; scientific cultivation; instruction in the care and repair of magnetos and carburetors, in proper loading and hitching of different types of implements, in tractor maintenance and field repair.

The Killefer Mfg. Co., of Los Angeles, some time ago shipepd a specially constructed plow to Honolulu with the understanding that if it proved satisfactory there would be orders for 100 more. On January 8 an order for the second one was cabled them. There are three mold board bottoms which plow 20 inches deep and a sub-soiler under each, which goes 10 inches deeper. A 75 h.p. tractor is required to pull it.

Federal Judge Oscar E. Trippit of Los Angeles and Clay Larimor of North Dakota have recently had a thousand-foot well drilled on their ranch southeast of Los Angeles, formerly a part of the Tweedy Ranch. A new Layne & Bowler turbine centrifugal pump has been installed. This tract is leased to truck growers and makes a valuable addition to the city's vegetable supply. The large pump installed was manufactured in Los Angeles.

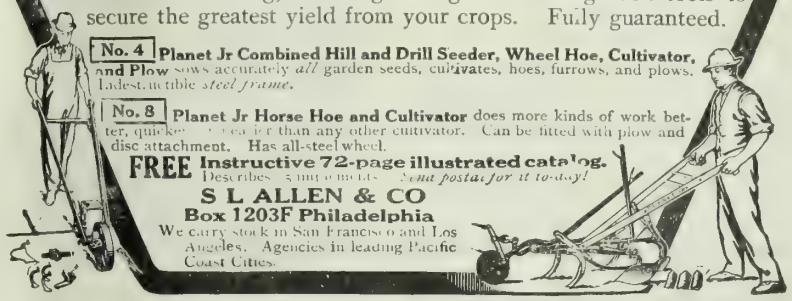
Guy .C Earl, attorney of San Francisco, has recently had a 16-inch well drilled on his ranch at Palmdale. He has installed a Layne & Bowler turbine centrifugal pump in the well.

The KROGH Vertical Pumps

New Type Vertical.

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film; absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.



Get our Bulletin No. 78 before deciding on a pump.

S L ALLEN & CO
Box 1203F Philadelphia

We carry stock in San Francisco and Los Angeles. Agencies in leading Pacific Coast Cities.

The long continued rains will make the call for WEEDERS and MULCHERS very heavy during the next few weeks, and as there is a very limited amount of these tools on hand, it is advisable to get orders in early.

KILLEFER QUALITY

KILLEFER EFFICIENCY

Clean Cut Weeder and Mulcher

It is just what the name implies, the most effective tool for keeping down the growth of weeds after rains or irrigation on orchard, bean, beet, or grain land. It does twice the work with the same team of any other tool for this purpose, and as the knives overlap each other it is impossible to miss anything in their course. Our patented knives are formed with a straight throat so that they wear uniformly from heel to point and are all stamped with our quality trade mark.

The orchardist will find this tool a valuable one for leveling down furrows and for preparing the ground for the cultivator. The large range of work makes it almost indispensable, and the extremely low price at which it is sold brings it within the reach of all. **Made in 4, 5, 6, 8, 10 and 12 foot sizes.**

THE KILLEFER MANUFACTURING COMPANY

2209-21 SANTA FE AVENUE, LOS ANGELES, CAL.

Silos Prove Corn Possibilities.

[Written for Pacific Rural Press.]

If everyone's experience in raising Indian corn for the silo is as enlightening as that of A. B. Goodwin, near Manteca, San Joaquin county, the time should not be far distant when corn will be the leader of summer crops in this State.

After erecting his 120-ton silo last spring Mr. Goodwin was advised to plant about 16 acres of his sandy loam, sub-irrigated land to corn, in order that he might have enough forage to fill his silo.

After plowing and harrowing, the land was planted the first week in June, Yellow Leaming seed being used. Planting for silage the planter was regulated to drop seed every 18 or 20 inches in rows 40 inches apart. The field was cultivated three times and cut with a corn binder the middle of September.

At that time it stood 10 to 12 feet high in the shock and instead of requiring the entire 16 acres to fill the silo, less than eight were needed and the balance was left in the shock for grain. Although it was planted too close in the row to make a heavy yield of grain, it was estimated by corn growers that it would go 40 or 50 bushels to the acre. This yield in connection with a lot of good pasture for a herd of 50 hogs convinced Mr. Goodwin that Indian corn is a more profitable crop than the sorghums in his locality and a lot easier to handle.

This year he expects to plant two fields, one for silage and one for grain. He will precede the silage crop with a crop of oats for hay.

WHEN TO PLANT SORGHUMS.

[Written for Pacific Rural Press.]

Growers of non-saccharine sorghums in the interior valleys have found that it does not pay to delay planting too far into the summer, because of the difficulty of getting it to ripen before the fall rains.

Last year was exceptional on this account as the heavy rains held off till December, but even then some of the sorghums, particularly feterita, were not thoroughly ripe when harvested and heated badly as a result.

When possible, planting should be done early in May and if soil moisture conditions are at all favorable, harvesting can be safely done in September, before the normal rainy season starts.

Experience on many ranches last year indicated that feterita yielded more grain than the other sorghums, but complaint was registered that it heated badly in the sack. Early planting will overcome this as it is primarily a matter of having it thoroughly ripened before harvesting.

PLOW BERMUDA SHALLOW.

[Written for Pacific Rural Press.]

Bermuda grass proved the savior of the sandy, washy, irrigation ditches in the pioneering days of Imperial valley. It is now seeding the cultivated lands. Horticultural Commissioner F. W. Waite and Dairy Inspector H. T. Nye agree that the only way to kill Bermuda grass is to plow it not over four inches deep and very thoroughly, turning it upside down to expose its roots to the hot sun from April until July or August. Then it may be replowed, deeply this time, and barley or sorghum corn planted. Mr. Nye says even sheep won't kill it here, and that unless alfalfa is given all the attention it needs to keep every part of the field vigorous, Bermuda will spring up where it is weak and surely choke it out.

MISCELLANEOUS NEWS NOTES.

About 1300 head of beef cattle are being fattened entirely on cottonseed meal and hulls at the Imperial Valley Oil and Cotton company's mill at El Centro. There are also about 900 at the Calexico mill.

The State Prison Board Directors set a price of 10 cents each for the 4,500,000 grain bags now on hand by that institution. They estimate that 60,000,000 bags will be needed for this year's crop of grain in the State.

At a meeting held at Sanger, January 15, it was unanimously decided to organize a farm bureau and circulate a petition to be presented to the board of supervisors for the establishment of a farm adviser in the county.

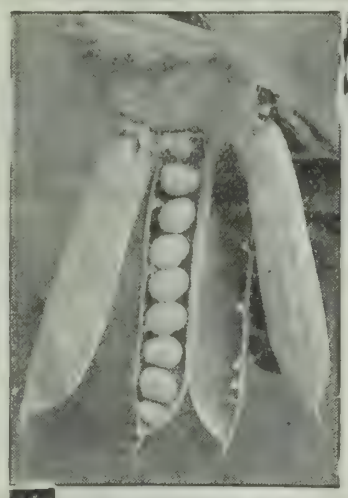
According to G. E. DeSellem, county bee inspector for Los Angeles county, 3,000 tons of honey were produced in the southern part of the State last year. The average price for honey last year was right around $100 a ton.

The owners of the Nacimiento ranch near Kings City are just completing the installation of an irrigation system which will allow them to grow several hundred acres of alfalfa. With the completion of the development work it is thought that the company can turn off their cattle in the late fall and early winter. The ranch is carrying about 2,000 head of cattle this winter.

Second Thousand Answered Questions in CALIFORNIA AGRICULTURE

Our latest book, just from the press, contains 256 pages of text, cloth bound, and sells for $1.50 per copy.

This book is made up of questions and answers. Divided into nine parts, covering fruit growing; vegetable growing; grains and forage crops; soils, fertilizers and irrigation; live stock and dairy; feeding animals; diseases of animals; poultry keeping; pests and diseases of plants.



The live stock and dairy, the diseases of animals, and pests and diseases of plants are very fully covered. We believe that there has never before been printed such a complete list of sprays and poisons and tables for use as are here given.

You need this book in your library. It will come in handy every day in answering some bothersome question which may need quick action. The carefully compiled index tells you where to locate the information you want at a glance.

We want to send you a copy. Send for our special offer made to every one of our subscribers.

Community Effort and Hanford Hog Sale.

[Written for Pacific Rural Press.]

If any evidence were needed of the magnitude purebred hog-raising has attained in just recent years in California, it could be no more forcibly presented than in the announcement of the first semi-annual sale of Poland-Chinas which are to be sold at Hanford February 5th.

As we pointed out in this paper before, Kings county's advance in purebred swine husbandry, and particularly with Poland-Chinas, has been more marked than any other county in the State; and yet, few would have considered it possible to have assembled 150 head of registered hogs, all of one breed, into an auction sale from even Kings county.

Another point which the announcement of this sale brings out is the value of community effort with one breed. Such a sale would not be possible in communities where each breeder has a different breed and where co-operative work is largely lost on that account. The lesson which this sale affords is therefore well worth remembering by farmers in new and growing sections of the State, as well as in our older districts.

As to the animals offered in this sale, the names of the consignors speak for the quality of the stock. They are M. Bassett, Wm. Bernstein, J. A. Crawshaw, Oscar Dimmick, F. D. Ross, Geo. A. Smith, W. D. Trewhitt, and T. J. Gilkerson.

In writing this office regarding the sale Mr. Bernstein says: "I am consigning a number of tried sows in this sale which will be a real attraction. Two are sisters to the 1914 State Fair champion boar, and two are sired by him, also several young boars and open gilts. Am also offering four big-type sows that have raised two litters each. Have 33 head altogether in the sale."

J. A. Crawshaw has ten head in the sale, two typey boars, four gilts bred to Long Wonder, his reserved herd boar, and four pigs, three females and one male. Both of the boars in this offering are of serviceable age, and the entire lot are of choice breeding.

W. D. Trewhitt has 37 head in the sale, consisting of two aged sows, 25 gilts, and 10 boars all of serviceable age. They are sired by such good boars as Jumbo Equal, Big Chief and Nugget, and are out of Mr. Trewhitt's best sows.

M. M. Bassett is offering four boars by such breed leaders as Hustler and carrying the usual good Bassett individuality.

Geo. A. Smith has 10 boars and 12 open gilts in the sale, sired by Iowa Wonder.

F. D. Ross has four boars and five gilts in the sale, sired by The Kid and Warrior.

T. J. Gilkerson has nine head of nice ones consigned, sired by Stratford Bay; and Oscar Dimmick, four pigs sired by Chief Picture 2nd.

SWINE BREEDERS MEET.

The annual meeting of the California Swine Breeders' Association was held at Sacramento, Jan. 26; A. M. Henry, President, presiding. There were present close to 75 swine breeders and those interested in the production of more and better hogs in California.

Splendid interest was taken in the subjects discussed, and it is to be regretted that 750 instead of 75 did not attend to hear the facts, ideas, and suggestions brought out by the veterans in the swine business, on the breeding, growing, and selling of hogs.

Probably to most of the hog men present, the subject of hog cholera and its control, taken up by Dr. B. J. Cady of the U. S. Dept. of Agri., who has for a number of years been carrying on a fight against this disease in this State, was the most interesting and valuable. It is a vital question that all hog men have to face; and which can be best met, as Dr. Cady pointed out, by the co-operation of all the farmers in the State. The facts and information given were a direct result of Dr. Cady's own personal work.

C. B. Cunningham of Mills gave a very interesting talk on the selling side of the purebred business.

Two barrows were judged by Prof. J. I. Thompson, from a butcher's standpoint, and some very interesting points brought out. On Thursday, the same hogs were again judged after they had been dressed, by one of the local butchers at the Fair grounds.

C. N. Slocum of Willows stated some very interesting facts on the value of a good pedigree, while A. B. Humphrey of Mayhews spoke on the value of a good sire.

Chas. W. Paine, Secretary of the State Board of Agri., was there to tell the breeders that the 1916 State Fair would be the biggest ever.

The subject of feeds and feeding, on which a number of breeders gave their views, proved quite interesting and valuable to all.

As this was the annual business meeting of the Association, an election of officers was held and C. B. Cunningham of Mills was elected President; J. K. Fraser of Denair, Vice-President; Prof. J. I. Thompson, Secretary; and A. B. Humphrey, Mayhews, M. Bassett, Hanford, M. Rucker, Fair Oaks, and Alex S. McCarty, San Francisco, Directors.

Further particulars in regard to the meeting and sale will appear in the next issue.

The American Sugar Beet Co. has received 50 tons of beet seed for this year's planting in the vicinity of Chino.

JERSEYS!!

EMPRESS LASS,

Grand Champion Jersey cow at Alaska Yukon Exposition and several times at California State Fair. Gave 82.32 pounds fat during December, 1915, under dairy conditions.

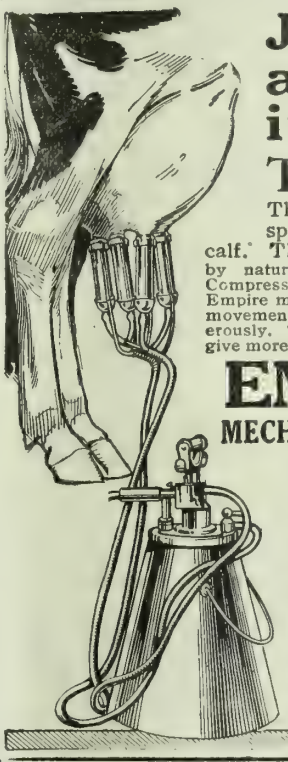
Her Grandsons and Other Bulls From Good Producing Cows **FOR SALE. Priced Right.**

N. H. LOCKE CO., Lockeford, Calif.

40 Shorthorn Bulls and Heifers

REGISTERED AND TUBERCULIN TESTED.

NOW, at my farm at Perkins, 6 miles East of Sacramento. This stock was purchased from the best herds in Nebraska for my California trade, and are as fine a lot of one and two-year-olds as I could secure. Inspection invited. Call and see them before purchasing elsewhere.



Also have a few registered **BERKSHIRE GILTS** for sale.

I will leave shortly for the East to fill orders for Shorthorns and Herefords. Write me at once of your wants so that I may fill your order on this trip.

H. L. MURPHY

PERKINS, SACRAMENTO CO., CAL.

Brighton Herd of Shorthorns. **Established 1880.**

Just Like a Sucking Calf

THE Empire way is the natural way. The milk is drawn in spurts as by a sucking calf. This action is produced by natural atmospheric pressure. Compressed air is harsh, irregular. Empire milking is a gentle, uniform movement that cows respond to generously. They stay fresh longer and give more milk.

EMPIRE

MECHANICAL MILKER

One double or two-cow unit takes care of 20 to 30 cows per hour. One man can operate two double units. No costly or elaborate installation. Only one tank—only one pipe line. Operation is simple and economical. Install the Empire and make your dairy modern, efficient, profitable, sanitary—money-making and labor-saving.

Write for description and pictures showing Empire Milker and Empire Separator in modern dairies. Get our offers on Empire Gasoline Engines and Empire Star Feed Mills. **Ask for Catalog No. 45**

EMPIRE CREAM SEPARATOR COMPANY

Hanford, Kings County, Cal.

National Publicity for Dairy Products.

[Dairy Interests of Nation Propose Following Plan of California Orange and Raisin Growers Towards Increased Consumption.]

A great national education advertising campaign having as its object a better understanding as to the real food value of dairy products among the average housewives of the nation and a better portrayal of the industry to the public as a whole is the most important need of the dairy industry of this country at the present time.

Such is the decision of the committee of ten, appointed by the National Dairy Council to investigate the situation. This committee was composed of members from the following dairy interests of the country: cattle, milk producers, butter, cheese, milk dealers, food commissioners, feed, ice cream, farm machinery men, dairy and creamery machinery maunfacturers.

It is the opinion of this committee that so much has been said by irresponsible parties and self-seeking politicians about human food, particularly those foods upon which it is so easy to center attraction, through the making of reckless statements about disease in cattle and uncleanliness of handling and manufacturing of dairy products, that the consuming public has been in a quandary as to what to buy for clean, wholesome food, that the cost of actual living might be kept within the bounds of the average pocketbook.

The National Dairy Council, representing all branches of the dairy industry, decided, at their first annual meeting, held in Chicago, November 5, 1915, to direct a campaign of education upon producer and manufacturer of dairy products to bring the quality of American products up to the very highest standard, so that an educational advertising campaign, that is to be launched at once, to have the housewives of America use dairy food products more extensively, will be backed up with quality. All individuals, firms or corporations will be approached to support both campaigns by representatives of each interest.

The Plan of Campaign.—To meet this situation it is proposed to raise a fund of $150,000 to $200,000 a year for a period of three years to cover an advertising campaign similar in character to that which proved so successful in promoting a universal use of California Sunkist Oranges and California Raisins, and of other foodstuffs, believing that there is a very imperfect understanding regarding the advance made in the industry and the actual food values offered the consumer—cost and value considered. Such a work must prove successful to these interests.

1. The campaign upon the housewife will comprise paid advertisements in national mediums and city newspapers, presenting claims as to milk, cream, butter, cheese and ice cream being the best food possible to obtain, and seeking increased patronage.

2. Distribution to publications of press matter prepared by experts and distributed by the council. These articles will be prepared and issued by publicity experts who are familiar with the industry and will cover manufacture as well as information relating to the healthfulness of dairy products.

3. Distribution of recipes. Educational pamphlets and bulletins will be distributed to the consuming public through their own agencies, such as milk men, butter and cheese dealers and ice cream parlors.

4. Organization of a Speakers' Bureau and a Demonstration Bureau in charge of women to demonstrate use of dairy products, by which consumption may be greatly increased

5. Food films of educational value for movie shows, showing manufacture and distribution of dairy products.

The campaign upon producer and manufacturer will be equally intense through medium of bulletin and educational bureau, by which State and Federal institutional educators will show the advanced work they are doing in the manufacture of dairy products. Experts on improved methods of manufacture, to lower cost of production and distribution and improve products, will be employed to contribute their knowledge for the benefit of producers and manufacturers.

Why All Should Enlist.—This campaign of advertising is to be national in character, therefore every interest must be benefited. If one interest remains inactive, all must suffer. The sum per industry or per individual that will be required to make up the seemingly large sum of money is so very small, relatively speaking, compared to the billion dollars at interest, that it will be marveled at that something of the kind that can be so reasonably conducted has not been done before. Each individual will be called upon for support by the member of the Committee of Ten representing his interest and when the whole body of the dairy family is obligated for their share of the expense the work will be commenced. This is a work that no man should shirk his share of expense in. It means building an industry that must now be advanced to its proper place in the world's commerce and in its proper relation to successful agriculture. Competitors in all lines of manufacture have derived benefits from advertising that are at command. Will all interests reach for their share through present day methods, or permit their interests to suffer for want of proper presentation to the consuming public and open to hurtful attack when honest presentation of facts would help the cause and disarm criticism? Every man who has the welfare of the dairy industry at heart or is endeavoring to advance his own interest will respond to this appeal to arms.

This plan should meet with exceptional approval in California where the results of the national educational campaigns of both orange and raisin growers is so well known and ably demonstrated.

The milk in the pail the cow kicks over is lost forever

AND the butter-fat that goes into the can through the skim-milk spout of a cheap, inferior or worn-out cream separator is just as surely lost as the milk in the pail the cow kicked over.

If you are trying to get along without a cream separator; or with an inferior or worn-out machine, you are losing butter-fat right along and butter-fat is money.

Get Your DE LAVAL Now—Right Away

every day you use it it will be paying for itself out of its own saving.

If you haven't the spare cash right now that need not hinder your immediate purchase.

We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at time of purchase and the balance in several installments, so that a De Laval really pays for itself while you are using it and getting the benefit from it.

Let the De Laval start saving cream for you right now while butter and cream prices are highest. See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

14 Months With Milking Machines.

[Written for Pacific Rural Press.]

Milking machines have few better friends in California than W. C. Hoskins, who has a large dairy near Thornton, San Joaquin county.

A little more than 14 months ago Mr. Hoskins had a three unit Empire machine installed and since then has milked an average of about 90 cows, twice a day. He hires two men, who do all of the milking, feeding and clean the barn, milk house and utensils. One man looks after the machines and the other does the stripping after the machines have been taken off. Mr. Hoskins has found this the best method, owing to the fact that the average teacupful of milk that the stripper gets consumes a good deal more of the machines' time than when milking on a full udder.

He has found that it takes nearly as long to milk the cows now, when their milk flow is small, as it did in the summer when their flow was heaviest. Last summer, when he was milking 96 Holsteins, and most of them were heavy milking ones, it took the two men about three hours, on the average, to feed, milk and wash up machines and other utensils.

He states that his cows are milked dryer now than they were before he installed the machines, principally because a milker who has a string of heavy milking cows is apt not to milk very dry unless he is watched closely. He is apt to be thinking too much about finishing his string, or his hands begin to cramp. The man running a machine is not in a hurry and his hands do not cramp.

It is of interest to note that before purchasing his machines, Mr. Hoskins went to a dairy that had put in milking machines but had taken them out. But he says that when he saw how it had been taken care of and how the cows had been treated he decided that it was no fault of the machine that it had been a failure, but entirely due to the way it had been handled.

Mr. Hoskins believes that the machines are a success providing you have men in charge of them who understand them and take pride in seeing that they do good work. His cows have not fallen off in their milk, nor have any of them had sore udders as a result of the machines, and he claims that they go a long way in solving the labor question on a large dairy.

RICE PRODUCTS FOR STOCK.

In answer to a subscriber who wishes to know about the by-products of rice as a stock feed, a resume, taken from bulletin 330, of the U. S. Dept. of Agr., says: Rice hulls are now considered of little value, if not positively harmful, as a stock feed. There is a limited market for them as a packing material of about $4 per ton, but by far the greater portion is burned to furnish power for the rice mills. Rice bran, when fresh and free from hulls, is an excellent stock feed, but on account of its high fat content it is liable to become rancid and therefore unpalatable to cattle in warm weather. It is also frequently attacked by weevils and other insects if stored in warehouses infested by them. Rice polish is a highly nutritious flour and is used in the United States as a stock feed, Like bran, it is susceptible to insect attack and becomes rancid in a warm climate. The accumulation of weed seeds mixed with small amounts of rice and sweepings from the mill is generally sold locally as chicken feed. Such material may amount in exceptional cases to 15 per cent, but the usual figure is probably less than 1 per cent.

HANDLING WOOL CO-OPERATIVELY.

To encourage the sheep raising industry of Manitoba, Canada, the department of agriculture handled last season's wool clip on a co-operative basis.

At the request of the Minister of Agriculture and Geo. Gregg, secretary of the Provincial Sheep Breeders' association, the department took charge of the work in May, circulars being sent to all the known breeders of sheep in the province, announcing the plan and giving packing and shipping instructions.

Each farmer's shipments were separately weighed and graded by an expert wool classifier and each lot treated alike whether they were from two or two thousand sheep.

On receipt of the wool the department paid an advance of 15 cents a pound and later sold the entire lot, some 17,000 pounds, at auction for $26.80 per hundred.

On the whole the results were most satisfactory to the farmer, as after deducting one per cent for commission he realized five to seven cents more per pound than he would have without the department's aid.

SUGGESTS ADMINISTRATOR FOR HORSE BREAKER.

To the Edtor: I have read with interest, in your issue of January 8, of the trouble Geo. E. Wright has been having with his saddle mare, and can sympathize with him and will earnestly beg him not to try any such pranks as a neighbor from San Andreas advised, which was on this line—"A strong bridle, a strong saddle, a heavy quirt and big spurs, a strong cord for tieing nose to cinch."

These are all well to own, but stop right there, Mr. Wright, unless you are a full-fledged member of the "Wild West Show" or of the "101 Ranch," or have first-class ability in applying all of the paraphernalia to its intended use and, more particularly, be ready yourself for what may be a change in your life. If ever you should get your person all wound up in this rigging, the sale of such animal as referred to may be conducted by an administrator or loved ones left behind.—Reader, Porterville.

[If Mr. Wright is still alive to tell the tale, we should like to have him advise us how he really did break that horse in order that the controversy may be definitely settled.—Editors.]

The Dairy Farms Co. near Modesto are checking and seeding 140 acres of land for alfalf this seson. They expect to enlarge their dairy herd to take care of the additional feed.

REMCO

REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

REMCO

Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

DAIRYING.

Creameries in Tulare paid out about $65,000 for cream received during December.

A report from Tulare says that a cheese factory is to be established near there by R. Orsi, a Swiss dairyman.

M. J. Schoonderwoerd has recently sold 40 head of dairy cows from his ranch near Chowchilla, for an average of $100 a head.

G. F. McCarty of Esparto has lately purchased the Holstein bull Maud Mooie's Prince of Riverside from The Harlan Farm herd of Holsteins at Woodland.

The cow, Frau Cremel Stratford Korndyke, owned by Mrs. T. J. Gilkerson of Lemoore, has just completed a seven-day official test with 21.69 pounds of butter.

H. R. Timm will plant 10 to 15 acres of cactus on the Hunt ranch in Contra Costa county, which he recently leased, to supply feed for additional cows which he expects to add to the Hunt herd.

Plans are under way for the consolidation of the Bodega Creamery Co. and the Bay Creamery at Bodega, Sonoma County. The new concern will be known as the Bodega Cooperative Creamery Co.

In a letter to this office from Hewitt and Hewitt of Hardwick, they say, "Have bought from G. A. Smith, Corcoran, Prince Beauty Pietertje Segis for F. M. Helm of Fresno. Paid $5,000."

W. L. Hodges, who has a big modern dairy near El Centro, plans to stock another 320-acre ranch near Holtville with purebred Holsteins. All other stock on the ranch, even to chickens, will be purebred.

Kings county dairymen received approximately $140,000 for cream delivered by them during December which made a total of upwards of $1,775,000 paid to the dairymen of that county during the year 1915.

There were 12 cows in the Tulare Cow Testing Ass'n which made 45 pounds of fat or more during the month of December. A Jersey owned by C. W. Brown topped the list with 1137 pounds of milk containing 56.9 pounds of fat.

The following prices were paid January 15, by the various creameries in the Ferndale district: Capital, 31¼c; Grizzly Bluff, 31c; Central Creamery Company, 31¼c; Valley Flower, 31¼c; Libby, McNeill and Libby, 31½c.

F. H. Van der Poel of El Centro is milking about 18 Jersey heifers sired by the bull Rowena's Interested Fern. Only one is giving less than 30 pounds of milk a day and two of them gave over 50 pounds a day soon after freshening.

The N. H. Locke Co. report the sale of Foxy Blondy's King of L., sired by Valet's King of L. and out of Foxy Blondy of L., to Chas. Nelson of San Francisco. The dam of this bull made 50.6 pounds of fat in one month as a two-year-old.

Word comes from Sacramento that T. E. Getzelman of Hampshire, Illinois, is negotiating for a location near Sacramento where he hopes to establish his herd of registered Holsteins. Mr. Getzelman has made several trips to California during the past year in search for a desirable location.

We are advised by C. M. Winslow, secretary of the Ayrshire Breeders' Ass'n, that the following officers were elected at the annual meeting held at Philadelphia recently: president, Percival Roberts, Jr.; vice-presidents, J. W. Clise, Adam Seitz and Hugh J. Chicholm. Mr. Winslow was again elected secretary-treasurer of the organization.

The 82 head of registered Holsteins bought by J. M. Henderson Jr. in the east make a total of more than 200 head of Holsteins now on the Henderson ranch. Mr. Henderson states that in a short time they will be able to supply bulls of the very best blood to be found in America, with any combination of blood the buyer may wish for. Several cows are on official test now that promise to do extra well.

J. D. Huston is building a big, open, concrete floored dairy barn at Imperial. A milk cooler, refrigerating plant, cheese factory and cold storage plant are nearly all completed, ready for operation. A big cesspool and sewer will take care of the drainage and even the bull pens will be concrete floored. He expects to sell sweet cream in Los Angeles. He has over 100 head of purebred Jerseys, all of much noted ancestry.

In the monthly statement of the San Joaquin County Dairymen's Ass'n, H. J. Culbertson, official tester for the association, gives figures showing that the cow Empress Lass, owned by the N. H. Locke Co., gave 1470 pounds of milk containing 82.3 pounds of butterfat during the month of December. This cow is one of the most noted show cows in the Locke herd, having been a prize winner at all of the prominent livestock shows in recent years, and as an individual has always stood high in the estimation of Jersey breeders in this State. It is another illustration of the benefits derived from the tester and scales.

A correspondent of this paper writes: "On our way from Stockton to Modesto by auto we were impressed with the number of silos that were put up there the past season. We could count as many as 25 from the road, most of which were made of wood. E. Ustick of Modesto informs us that he had one erected last fall and expects to put up another this year. He found that when he quit feeding green alfalfa that his cows dropped in their milk flow from six to three cans. Since starting to feed silage they have picked up and are giving six cans again, even in the cold stormy weather which we have been having. Most of the silos here are filled with corn, though we find many that are filled with barley and vetch and some that were filled with sorghum."

SWINE.

Ordway Bros., of Petaluma, received 138 stock hogs from Tom Garner of Ukiah last week which were put in their fattening pens, to be later shipped to San Francisco.

Peters and Lamson of Holtville have 600 purebred Durocs on an 80 acre alfalfa farm in 10 fields of about 1¼ acres each. They are alternated in 10 other similar fields to let the alfalfa grow. Corn and tankage are bought to feed with the alfalfa.

G. D. Willoughby & Sons of Calexico have about 100 registered Duroc sows. They are working gradually into purebreds, having started with purebred boars on grade sows for market hogs. Their 900 head are kept scattered over 200 acres of alfalfa, barley and milo, which furnish practically all the feed.

A. J. McPherrin of Imperial has 120 fattening hogs and 100 milking Jerseys besides 100 young stock on 110 acres of alfalfa, barley, milo, sorghum, and Indian corn. The corns are largely made into silage, most of the rest is pastured off, according to his manager, Geo. V. Rude.

We have just received the catalog of the First Semi-Annual Sale of Registered Poland Chinas to be held by the Kings County Poland China Breeders' Ass'n at Hanford, February 5. This promises to be the largest auction sale of hogs ever held in this State and from the offering buyers should be able to find some of the best individuals of the breed in the West.

Breeders of Duroc-Jersey hogs in Arizona met January 12 and organized the Arizona State Duroc Jersey Breeders' Ass'n. The following officers were elected: President, A. S. Donau, Tucson; vice-president, I. deR. Miller, Phoenix; secretary, F. C. Mack, Tucson; treasurer, Dr. C. Howard Davis, Toltec; directors, W. E. L'Hame of Cochise; Professor G. W. Barnes of Tucson; Roy Guild of Rillito.

W. A. Young of Lodi reports the following sales of purebred Poland Chinas since the P. P. I. E.: J. A. Thomas, Gilroy, one boar; A. Ryann, Casa Grande, Ariz., one boar; L. White, Jackson, one boar; L. McCracken, Ripon, one boar; C. B. Bovard, Yerrington, Nevada, three bred sows; C. A. Kirkpatrick, Lancaster, three bred sows; W. Moore, Fallbrook, one sow and one boar; Theo. Beckman, Lodi, one boar; W. H. Holloways, Yerba Linda, bred sows; F. E. Sanguinetti, Yuma,

WANTED.

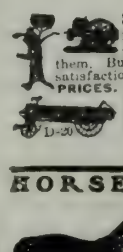
WANTED—About sixty young men and women to enter the WESTERN NORMAL on January 1, 1916, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information address, WESTERN NORMAL, J. R. HUMPHRIES, Principal, Stockton, Cal., Box 704.

WANTED—Position as manager of large orchard, vineyard, dairy. Alfalfa and grain farming. By a man with many years of practical California experience. Reference. Room 336 Hotel Alpine, San Francisco.

WANTED PROFESSIONAL BUDDER to bud 10,000 seedling peach trees. Apply H. F. Pixley, Corte Madera, Marin county, Cal.

LAND FOR SALE.

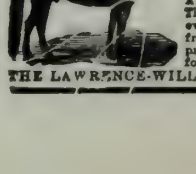
FOR SALE—In order to prevent positive foreclosure, I will sacrifice a thousand acres of choice level farm land near Corcoran that in normal times would bring no less than $75,000 for $50,000, if an immediate sale is made. Must get at least $5,000 cash at once; the balance can be paid in annual installments of $5,000 or more. This positively is a rare opportunity to make a big profit on a very small investment just as soon as times improve. Know no reason why any farmer should not make future payments out of grain that could be raised thereon. Address E. F. Marek, General Delivery, Los Angeles.



CALIFORNIA LAND—Money-making little farms, high class, low-priced properties in all counties. Call or write the oldest land office in California; we will save you 25 to 50 per cent. C. M. WOOSTER CO., 303 Phelan Building, S. F. Catalogue free.

LONG LEASE ON SHARES—Old established nursery. Wholesale and Retail. Good terms. Full particulars, write Tribble Nurseries, Lodi, Cal.

ORCHARD, ALFALFA, STOCK OR RICE RANCHES for sale or exchange. Alex. T. Gibson, P. O. Box 361, Chico, Cal.



20 ACRES IN ALFALFA adjoining Kirkman Nursery, near State Highway. Fine pumping plant. S. H. Kunkle, owner, Madera, Cal.

WANTED GOOD FARM, or unimproved land from owner. H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

SEPARATORS, ENGINES, SPREADERS
200,000 customers testify that my designers and factories build quality into them. Built for long, hard, continuous users' satisfaction. **HIGHEST QUALITY—LOWEST PRICES.** About 1-3 to 1-2 less than you usually pay. Don't buy till you get my catalog of these and other farm and household goods free. A postal gets it. Low freight rates. WM GALLOWAY CO., BOX B WATERLOO, IA.

HORSE OWNERS! USE
GOMBAULT'S
CAUSTIC BALSAM.

A safe, speedy and positive cure. The safest, Best BLISTER ever used. Removes all bunches from Horses. Impossible to produce scar or blemish. Send for descriptive circulars.
THE LAWRENCE-WILLIAMS CO., Cleveland, O.

RAISING HORSES FOR FARM AND MARKET.

(Continued from page 121.)

resent method of buying stallions as not given desirable results. The ity buyer's standard must be the tandard upon which market horses re sold; and no matter what the reeder himself may think is the roper horse for his own farm work, e should keep the kind the market emands.

Breeds.—There is no necessity for rgument about breeds. The best lood of any of the leading breeds f draft horses will give results. here are more Percherons in the ountry than all other pure draft reeds put together. Next in order ome the Belgian, Shire and Clydes- ale. It is not so much a question f what breed as it is a question of whether the individual animal is ood enough. There is a distinct ad- antage in the farmers in a com- nunity uniting on a single breed. his enables buyers to purchase in ar lots when desired and adds to the ossibility of buying matched pairs.

Having sound mares that are eavy enough, not less than 1600 ounds and better for weighing up to 800, the next important point is to row the colts right. Some think a olt will not be a tough enough orse unless he has to rough it when oung. This is a decided mistake. A draft colt will make half his ul- imate weight at a year old if given n opportunity to grow, and he hould be given this opoprtunity. his means a liberal feeding of grain n addition to all the hay and grass he will eat. Oats and bran half and half—or rolled barley where oats are ot available—make suitable grain ixture, improved by the addition of bit of oil meal. At three he should e broken and for the next two years lo his share of the farm work; and t five he should be ready for the ity. It costs little if any more to raise a colt than it does to raise a steer. Then why not on our Califor- nia farms raise the horses that do the work in our California cities?

LIVESTOCK DIRECTORY.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practical and profitable—the kind that are highly satisfactory Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

YOUNG'S POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. 1st Prize 2-year-old Cal. State Fair 1914.

Segis Pontiac de Kol Burke

The bull that combines the blood of the greatest producing families in Holstein history. He is an outstanding individual weighing 2200 at just three years of age. His dam RIVERSIDE SADIE DE KOL BURKE, is the heaviest milker that the breed has ever developed. She and six of her sisters have records above 30-lbs. butter in seven days.

A few sons of this sire are now available, some of which are soon ready for service.. Several are from half sisters to Aralia De Kol, 30-lbs. butter in seven days at 12½ years, 28090 lbs. milk and 1142 lbs. butter in one year. Prices reasonable.

Pedigrees and Prices on Application.

A. W. Morris & Sons Corporation

Box 398-D. Woodland, Cal.

Agreed

Many leading gas-engine experts have recently declared that lubricating oil made from asphalt-base petroleum gives best results.

Pacific Coast motorists made the same discovery years ago. For the majority have been using Zerolene in preference to all other oils. They agree with the experts.

Zerolene is made from selected California petroleum—asphalt-base—under the unequalled refining facilities of the Standard Oil Company.

Next time you empty the crank case, refill with Zerolene.

Standard Oil Company
(California)

ZEROLENE
the Standard Oil for Motor Cars

PEDIGREED HOLSTEIN BULL
$250.

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. Her present record is 21.09, made at four years old, but she can make around 25 lbs. with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service.

Write or come and see him.
F. H. STENZEL,
San Lorenzo, Calif.

Oak Grove BERKSHIRES
CHOLERA IMMUNE

Our herd is Cholera Immune, the only Immune Berkshire herd in the State.
Fine herd boars in use and they are second to none on the coast. Our sows are of equal merit.
We have at present some 300 Berkshires and we know that we can supply what you want.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

CRUST ON HOOF.

To the Editor: I have a mare that got her foot cut with a scythe, just below the fetlock, when she was a small colt. It healed up and is well except that a hard crust formed where it was cut, just above the hoof. Can you tell me how I can cure it?—R. L. A., Turlock.

[Paint this crust with butter of antimony once a day until it disappears.]

MAY BE GLANDERS.

To the Editor: I have a driving mare that has a slight discharge of gray matter from her nostrils and blows considerably more than she should when hitched up. Can you give me a remedy for this condition?—P. W. S., Selma.

[Have this horse tested for glanders. If she does not react, give 5 grains potassium bichromate three times a day, dissolved in one ounce of water.]

SORE ON HOG.

To the Editor: About two weeks ago the hind leg of one of my sows became swollen and lame, then it broke and started to run and spread to her belly and broke out in three or four places. What can I do for her?—W. P. C., Middletown.

[This is necrobacillosis. Wash the affected parts with a 2 per cent solution of cresol twice a day until recovery.]

MAY BE TUBERCULOSIS.

To the Editor: I have a cow that will not freshen till July that is only giving one and a half quarts of milk to a milking. Last year she gave me two gallons to a milking. When she started to drop in her milk flow I fed her cocoanut meal, barley meal and bran in equal parts, but she did not increase in her milk yield. Then I started to feed her aflalfa meal and bran, but could not see any change. Could you tell me what is the matter?—P. C. B., Sonoma.

[Have this cow tested for tuberculosis.]

COW WILL NOT BREED.

To the Editor: I have a cow that lost her calf some time ago. She has come in heat three or four times since but does not seem to breed. What can I do with her?—F. J. D., Strathmore.

[Douch this cow with one gallon of warm water daily containing one dram potassium permanganate over a period of one week, then use two ounces cooking soda in one gallon of water for another week. If she does not get with calf after such treatment use a compressed yeast cake in one gallon of water daily for two weeks more. You must have patience in these cases.]

COW POX.

To the Editor: I have an old cow that had caked bag two years ago, owing to a careless milker. It afterwards broke underneath midway between the four teats and ran off for some time, accompanied by small breakings out on the side of the bag. The sore under the bag healed entirely, leaving a hard lump inside. Was not careful in drying her this fall and the lump seems still larger. The small eruptions have scabs on them yet. Can the condition be cured with a reasonable amount of treatment and what is the best treatment? Am milking six heifers who sometimes have a sort of a scurry on their bags, accompanied by small lumps under the skin, the trouble apparently disappearing after being greased for a time. What do you think this is?—C. L. E., Elk Grove.

[Give the old cow one dram calcium iodide twice a day for six weeks. The heifers were troubled with cow pox, a benign disease.]

WHAT CAUSES GARGET?

To the Editor: Will you tell us what causes garget?—F. T. B., Mountain View.

[Garget is an inflammation of the udder and may be either due to an infection or functional disorder. Its causes are so legion that the space allotted to the writer is inadequate for their enumeration. Potassium iodide is the drug par excellence in the condition known as garget, given in two dram doses two or three times a day, dissolved in water, over a period of from two to six weeks.]

SICK BOAR.

To the Editor: I have a boar that took sick about three months ago. His penis dragged on the ground for about a week and he tried to pass water all of the time. I was told he had worms so tried worm medicine without success. Now he is swollen underneath and cannot move. Could you advise me what to do for him?—J. L. R., Winton.

[This is paraphymosis and is an inflammation of the penis. It is probably too late to alleviate his trouble. Try applying hot compresses to the affected region and dram doses of sweet spirits of niter every two hours.]

WARBLES.

To the Editor: I have some heifers that have lumps under their skins, all over their backs, about the size of the end of a finger. They do not seem to change in size since I first noticed them last summer. What are they and what shall I do for them?—F. J. H., Fresno.

[These lumps contain the grubs of the fly Hypoderma Lineata, or Warble fly. They do no harm except when present in large numbers. They may be squeezed out with the hand or two or three drops of turpentine may be injected under the skin over them with a hypodermic syringe.]

MULE-FOOT HOGS.

To the Editor: What is the origin of the Mulefoot hog? Are they the product of natural selection, or artificial selection, or did they just grow that way from the very beginning?—Reader, Chico.

[The early history and ancestry of the Mulefoot hog is unknown, one theory being that it first came from Africa. You can secure further information of the breed by addressing C. G. Kreglow, Ada, Ohio, who is Secretary of the American Mulefoot Hog Record Association.—Eds.]

HORSES EAT WOOD.

To the Editor: Could you tell me what causes horses and mules to eat the wood on the fences and mangers? They have plenty of green feed, barley and salt.—H. T. D., Madera.

[This is at first caused from a depraved appetite and later becomes a habit. At first it is caused by a lack of mineral substance in the food. Give the following: Powdered nux vomica 1 oz, powdered iron sulphate 1 oz., powdered gentian 1 oz., powdered ginger 1 oz., powdered potassium nitrate 1 oz., powdered sodium bicarbonate 1 oz., powdered fenugreek 2 oz. Give one ounce of this mixture in the feed twice a day.]

NOTICE!

Wishing to devote my whole time to other business, I have decided to sell out my

Shire Stallions at Cost

in order to dispose of them quickly. Included are the stallions which have been at the head of my stud for the last two seasons. All are sound and good stock horses.

I can also spare one pair of "in foal" mares and three stallion foals. If you are in the market, do not miss this opportunity.

Farm Feeding Problems.

[Answered by Prof. F. W. Wo ll, University Farm, Davis.]

HOW TO BALANCE A RATION.

To the Editor: Will you kindly ll me how to balance a ration when ou have the digestible nutrients in ch one hundred pounds of differ- t feeds? Kindly give me an ex- mple.—H. I. M., Modesto.

[If the correspondent has some me to spare for studying, it ould be a good plan for him to ke the correspondence course in iry husbandry, which the Univer- ty offers, free of charge, to resi- ents of the State. A letter ad- essed to Professor W. G. Hummel, udd Hall, Berkeley, California, will ring the necessary information con- rning this and other correspond- nce courses in agriculture offered the University. A collection of me of the standard books on feed- g farm animals will also be help- l, both along this and related lines animal husbandry.

Putting the mater as briefly as ssible, we may say that scientific vestigations have established the ct that a good dairy cow will re- uire 2 to 2.5 pounds of digestible otein, and 12 to 15 pounds of di- stible carbohydrates and fat in her ily ration, the nutritive ratio of e ration (i. e., the relation be- ween the two groups of components entioned) ranging from 1:5-7; in ther words, a balanced ration would ntain 5 to 7 times as much digesti- le carbohydrates and fat (starchy mponents) as digestible protein flesh-forming substances). If the w is fed alfalfa only, she will re- ive the following amounts of di- stible components in her ration, ssuming that she eats about 30 unds per day:

Feed	Digestible Protein	Carbh & fat	Nutritive Ratio
0 lbs. alfalfa hay....	3.1	11.5	1:3.7

These figures are obtained from tandard tables. of composition of eeding stuffs, which show that 100 bs. of alfalfa hay contain, on the verage, 10.4 lbs. of digestible pro- ein and 38.2 lbs. of digestible carbo- ydrates and fat; hence 1 lb. con- ains .104 lb. and .382 lb., respec- ively, and 30 lbs. contain 3.1 and 1.5 lbs. The nutritive ratio is btained by dividing 11.5 by 3.1, hich gives 3.7, showing that the ra- ion contains 3.7 as much digestible arbohydrates and fat as digestible rotein.

A cow fed alfalfa hay only, there- ore, evidently receives too much rotein for best results, unless al- alfa is very cheap or the cow is a oor producer; in either case it will ot pay to feed her more expensive eeds. But from a physiological oint of view, the ration is too high n protein and has a too narrow utritive ratio. In order to improve t, feeds of a low-protein character ust be added to take the place of ome of the alfalfa hay. Feeds of his character which are available in his State are, among rough feeds: rain hay, cereal straw, Indian corn r sorghum stalks, Indian corn or orghum silage, etc.; among the oncentrates, barley, oats, Indian orn, sorghum varieties, dried plain r molasses beet pulp, cocoanut meal, tc. If corn silage is available the ation may be composed as follows:

Feed	Digestible Protein	Carbh & fat	Nutritive Ratio
0 bs. alfalfa hay	2.1	7.6	
0 lbs. corn silage.....	.4	4.7	
	2.5	12.3	1:4.9

Since both these feeds are bulky, containing considerable proportions of indigestible matter, and since heavy producers cannot do their best unless a fair portion of the ration is given in the form of easily digestible concentrates, the preceding ration may be improved by replacing some of the alfalfa with rolled barley, as shown below:

Feed	Digestible Protein	Carbh & fat	Nutritive Ratio
15 lbs. alfalfa hay	1.6	5.7	
30 lbs. silage	.4	4.7	
5 lbs. barley	.5	3.6	
	2.5	14.0	1:5.6

A great variety of different rations may be made up from the rough feeds and the grain, mill feeds and other concentrates available to our farmers, and in the selection of these, the relative cost of feeding stuffs must be considered as well as the character of the nutrients supplied in the rations. The largest production secured at a moderately low feed cost should be the aim to be sought by the practical dairy farmer, and not a production obtained at the cheapest possible feed cost, which may or may not give fair returns "at the pail." A goat living on circus posters and weeds picked up along the roadside is a very economical milk producer, but her production will not go far toward feeding and clothing the family. Even milch goats have to be fed liberally, and must receive grain too, if they are to make a satisfactory production.]

DRY-SALT CURED HAMS.

Dry-salted hams and picnics should be closely trimmed, and then sprinkled with a solution of sugar and saltpeter before being treated to the salt, explained Wm. Constantine during his interesting meat-cutting demonstration at O. A. C. The salt should be thoroughly rubbed on and the meat stacked in a suitable receptacle, where it should remain for two or three days—less time in warm, murky weather—and then be taken out, new salt well rubbed on, and repacked in a different position. This process should be renewed for a period of about sixty days, gradually lengthening the intervals of three days t ofive or six, and so on to the end of the period. The pieces are then taken from the salt and well-smoked. If well prepared the meat will keep well and also have a tendency to retain its best flavor and to brown nicely in frying.

GETTING COWS WITH CALF.

To the Editor: I notice in Press where someone is having trouble getting cows with calf. The following has never failed for me in this connection. A few hours before breeding take one small cake of yeast from a five-cent package. Soak in pint of lukewarm water, then add another pint of water and mix well. First inject a quart of warm water, washing the vagina thoroughly, then inject yeast solution and let her to the male in an hour.—J. M. Shank, Reedley.

[This remedy has given good results in the condition mentioned and is worth trying. The writer has published various lines of treatment in these columns from time to time and all are used with about the same success.—Dr. H. B. W.]

R. L. Clark of San Joaquin county has sold his herd of Holstein cows and is getting a good start in registered Percheron horses. He has four very fine Percheron mares and a young four-year-old stallion that weighs 2,000 pounds in breeding condition. State Veterinarian Keans pronounced him a perfect horse in every way. He is native bred out of imported dam and sired by an imported sire.

Those Cornstalks
Might have been Succulent Silage

Do stalks beat back and forth in *your* cornfield—gaunt, silent reminders of what *might* have been—or are you feeding them now as rich, juicy, nourishing silage?

It is during these cold, wet winter months that your feed bills seem to continually grow larger and your cream checks smaller. It is now that you realize most *your* need for an

INDIANA SILO

This famous silo has made millions for American farmers by giving them the best and cheapest feed they have ever used. Its sixty thousand owners are the men who *now* have plenty of rich, succulent feed—the men whose cream checks are largest and whose herd is sleekest—the *successful* men.

Why not investigate the Indiana silo now? Why not let our new Silo Book show you how to stop one of the worst leaks in your bank account? Our Silo Book will be sent free on request, with no obligation on your part. Fill in the coupon or send us your name on a postal. *Do it now.*

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

WHAT IS HOGANIZING?

To the Editor: Please explain or state where I can secure this information: What is Hoganizing, and of what special value is it to a flock of hens or their owner?—B. M. P., Raisin City.

[To Hoganize a fowl means to judge it for utility qualifications, viz.: ability to produce eggs, to lay on flesh, or to yield both eggs and flesh. This method of judging is taught by Walter Hogan in a copyrighted book he has written, entitled, "The Call of the Hen." It is not claimed that this method is as yet absolutely perfected, but it proves true in nearly all cases. It not only teaches how to determine the egg-laying qualities of the hen, but also how to rate the male bird as a breeder of laying pullets or of meat-producing progeny. This judging of the male bird is very important for the reason that when animals are bred to an extreme type there is an ever-increasing tendency to reaction and the male seems to be the avenue that Nature selects for this reversion to primitive conditions in physical qualities.

The following endorsement of the Hogan method is by the American School of Poultry Husbandry: "Some three years ago Mr. Hogan sent us three males, all Single Comb White Leghorns; one was of his 280-egg type, selected according to his system, another was of the 250-egg type, and the third was of a 70 or 80 egg type. He also sent us two pens of hens of his own selection and breeding. We trapnested all the hens, and bred from all three males. The results in every case have borne out Mr. Hogan's claims and the truthfulness of his methods of selection and breeding. We have also tested the hens in the egg-laying contests; taken measurements and made tests and judged their capacity for laying as per his system, 'The Call of the Hen.' The results so nearly tally with the system in practically every case that we feel that this is a valuable method of selection and breeding, which should be in the hands of every one who attempts to raise poultry."

"The Call of the Hen" may be had from several sources and can be supplied by the Pacific Rural Press. The price is $2 postpaid.]

BRED BACK HENS DO NOT LAY.

To the Editor: I have some pure-bred White Plymouth Rocks, late fall hatch, that have not started to lay yet, although over a year old. They look healthy and eat well. The feathers under the vent are stained from their droppings. What is the cause and remedy?—C. L. M., Manzanar.

[The staining of the plumage below the vent no doubt is due to some disturbance of the digestion, or to bowel trouble caused by some laxative food, and while in this case it may be one reason for poor laying, it probably has little or nothing to do with the lack of eggs. It is almost certain that these fowls have "bred back" to the egg production capacity of their wild progenitors.

As my son bred nine Buff Orpingtons hatched Oct. 1, 1914, that have done the same, it may be instructive to relate the circumstances that led up to this result. A friend had a 20-month-old cock of large size, beautiful color, and unusual vigor, for which he paid $25 as a very young cockerel. Having bred a large number of chicks from this bird, he wanted to trade him for two of my son's hens and a few days later he brought the cock to our house and made the exchange. On my arrival home that evening, my son said, "Dad, that cock is one of the finest colored birds I have seen and he is good looking generally, but according to the Hogan test he is worth less than two cents. However, I am going to breed him to my two best hens until I get a few eggs to set first part of September as an experiment."

He set two hens and after culling out three or four cockerels, there remained six cockerels and nine most beautifully colored pullets. The cockerels had every indication of being breeders of heavy laying pullets and were sold, but the pullets were worth less than nothing. One has gone into stew and the balance will follow. While no exact record has been kept it is giving them the benefit of the doubt to say that those birds, now nearly 16 months old, have not averaged eight eggs each in their entire laying period of, we will say, nine or ten months.

This illustrates how important it is to head the breeding pen with a male bird that is from a heavy laying mother, for that is what influences more than anything else the production of heavy laying pullets.]

POULTRY NOTES.

[By Geo. H. Croley.]

A peculiar condition of the turkey trade, during the recent holidays, was noted. While the receipts were unusually large, the offerings from the recognized turkey raising districts were apparently less than in former years, while many new locations supplied small or moderate sized shipments which in the aggregate amounted to a very great part of the delivery of turkeys to the San Francisco market.

After the close of the Exposition, it was anticipated that the unusual demand for squabs would rapidly shrink. Whether it is due to the natural falling off of supply at this time of the year or to the increased appetite of the local people for juicy squab, the fact remains that there seems to be as good a demand for extra choice stock as formerly.

As an argument in favor of raising heavy hens and the delivery of them in better condition, a writer in the Country Gentleman estimates that the addition of only one and one-quarter pounds per fowl to those produced in the United States would amount to a gain in weight of 1,125,000,000 pounds and a value of $225,000,000.

The University of Missouri has issued a circular regarding the poultry mite, in which it is stated that sunshine is one of the best remedies in an attempt to destroy them. This is another endorsement of the open front poultry house that permits the sunshine to penetrate practically every part of the house.

The third annual show of the Nevada State Poultry Ass'n was held at Reno, Jan. 20-23. Included among the educational or utility features of the exhibition, was an egg-contest for which cash prizes and ribbons were provided for first, second, third, and fourth prizes. While Reno is not in this State, it is so near the line that it is theoretically a California show. A California judge placed the awards, and exhibitors and visitors from this side of the line greatly assisted to make this show a success.

LIVE STOCK NOTES.

(Continued from page 142.)

one boar; W. D. Merril, Rio Bravo, one boar; C. R. Williams, Suisun, one boar; Chas. Williams, Concord, one boar.

BEEF CATTLE.

H. L. Murphy was a visitor to this office early in the week and informs us that he will soon leave on another trip east for Shorthorn and Hereford bulls. He already has a nice lot at his ranch near Perkins which he brought out some time ago and which he is offering for sale. He also brought out a nice lot of female Shorthorns which he will use in establishing what he hopes to be one of the finest herds of Shorthorns in the State.

SHEEP.

A report from Nevada states that over 90,000 head of sheep are grazing in Nye county, most of which are located in Hot Creek and Stone Cabin valleys.

A report from Klamath Falls, Oregon, says that 2,000 lambs were shipped from there by O. B. McKentree the middle of this month which had been fed on alfalfa. The report says that farmers got $15 a ton for their alfalfa by feeding it out.

A consul report says: "The fourth wool sale for this season in New Zealand came on in Auckland November 25, at which 9,318 bales were offered against 12,290 bales for the 1914 sale. The prices paid were greatly in advance of those ruling at the 1914 sale.

Woolmen in attendance at the National Wool Growers' Association convention at Salt Lake last week subscribed $6,000 in twenty minutes to maintain a lobby at Washington against the 640-acre Homestead Bill. Officers of the association were elected as follows: F. J. Hagenbarth, Salt Lake City, president; A. J. Knollin, Chicago, eastern vice-president; M. I. Flowers, Flagstaff, Ariz., western vice-president; S. W. McClure, Salt Lake City, secretary; F. D. Miracle, Helena, Mont., treasurer.

HORSES.

A horse buyer from Texas is located at Fresno who is said to be purchasing about 100 head a month for shipment to Texas. The account does not say whether these are for war purposes or not.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Ewaysgood, Pomona.]

RAISING GEESE.

Geese and ducks ought to be the vorite stock for all the young lks on the farm to invest in. They e so easy to raise and can be rned into money so quickly that e can scarcely think the time has me to sell.

Of course this does not mean that her geese or ducks can be raised thout work, or that they will stand y amount of neglect. On the con- ary they require good feed, plenty it and good care, but they pay for big and they are interesting from art to finish.

Hatching.—To begin with geese, is best to hatch the eggs either th geese or good reliable hens. A od plan is to set one or more ese and several good hens at the me time, then later test out the gs and relieve those hens that do t seem able to stand the strain, r it requires a good, hardy hen to tch geese eggs out. As the time r hatching draws near, give as any of the eggs as possible to the ese and watch the hens very close- as they may destroy the goslings nen they see what sort of family ey have brought forth.

Raising.—The goslings, when first tched, are very tender and the st chill, if it does not kill, might most as well, for the gosling that ts chilled rarely ever makes a good owth, if it lives. So as fast as ey hatch take them away from ose or hen and wrap in flan- l until you have several, when ey will do with a good nest of fine t straw under them and a warm ver. Make it close or they will awl out. After all are out just de- le how you are going to riase em. If with the goose, see that e is fed and watered well after r long vigil and allowed some ex- cise, then put her in a good nest th a fence around so that you can ntrol her for a few days, as the slings must not be left to roam at st. I prefer raising them by hand, ey are such a little trouble and ch good feeders that it delights my art to watch them.

Fireless brooders make fine places raise goslings in. Make a good st of straw, leaving no corners for em to get into. If there are any, l up with gunny sacks or other uff and just have a round nest for em. Have a good warm cover at st and lighten it as they grow. Do t feed for thirty-six hours after the tch is off and then not a great al. Just a little rolled oats and ead crumbs moistened in milk and little coarse sand in it, and a dish water they can reach in up to eir eyes but no further.

Feeding.—Feed rolled oats and ead crumbs about three days, then adually mix in one part of bran d one of cornmeal. After the first ek you can feed a mash of two rts bran, one part shorts or mid- ings, one part corn meal, one part eat scraps and always a little sand. ow this is supposing you are rais- g them without pasture; if you ve a clover or alfalfa patch, when e goslings are ten days old you n turn them out and just feed ce a day and see that they have a od dry bed at night and that is l the expense they will be to you. A good dry bed and keeping them out of water will save you many goslings, and the first few days the drinking water must have the chill taken off, for cold water gives them cramps.

Geese on range are as near self-supporting as anything I know of, and after they are grown they will stand about as much abuse, if there is any profit in abusing things, but while young they must be taken care of. If you don't want to turn them out on range, feed them lawn clippings or vegetables, chopped alfalfa or anything you happen to have, but don't change about too much as they are a little doubtful of changes in the feed. Geese are not strictly vegetarians, but they do not require so much animal food as either chickens or ducks.

USE CARE IN BUYING FOWLS.

Some time ago I cautioned readers of the Press not to get excited about the "Tom Barron" stock of Leghorns, that were winning at eastern egg contests, but it appears the caution was not heeded by one reader who lives in Idaho, Mr. J. L. Borden, who writes me that seeing the Tom Barron stock of heavy laying Leghorns advertised in an old reliable paper, the Rural New Yorker, he sent a money order for several hens, cockerels and cocks. As the price was advertised he did not have any correspondence concerning them, but took the advertisement to mean what it said, "hens that were heavy layers and large size."

When the stock came, they were found to be small, in fact very small, hens weighing only three pounds and cockerels three and a half pounds. One was knock-kneed, another was a worse cripple than that and all had scaly-leg and were lousy.

Instead of taking the matter up with the advertiser, Mr. Borden wrote to the Rural New Yorker, because they claim to guarantee their advertisers.

But in this case they were not true to their words, and after much writing back and forth Mr. Borden shipped the birds to the office of the Rural New Yorker in order that they might judge who was telling the truth in the matter.

John J. Dillon, writing for the office, became very indignant over this, telling Mr. Borden, that he evidently expected show birds, for the price paid, etc.

Now Mr. Borden contends that this was never thought of because Barron stock was not advertised as "show birds," but strictly "utility birds," and that was what he wanted, not knock-kneed, scaly-legged stock. Mr. Dillon further says, "scaly-leg is nothing, it is easily cured by poultry men." Evidently the gentleman never tried to cure it or he would not think it was quite so easy.

I do not mean to say that all of the Barron strain of Leghorns are like the birds sent to Mr. Borden; the breeder who sent out such stock as these and the newspaper that fails to make good its promise of protection are the ones I am after. Other breeders who advertise in that journal may, and doubtless do, breed this strain of Leghorns so that they are of large size that are heavy layers, just as is done with a number of good strains. The moral I wish to point is this: Don't run away with the notion that because the fowls of a certain strain have won great honors at some distant contest that all birds of that strain are anywhere near as good. Be just as careful in buying them as you would if they were not of a noted and widely advertised strain.

Melone and Perry of Stockton have completed the shipment of 17,000 sacks of barley to Europe.

Poultry Breeders Directory

RHODE ISLAND RED ANNOUNCEMENT.—Remember that February chicks are what you want for early high-priced broilers, and R. I. Reds are what we recommend for February. The pullets make fine winter layers. FOR SALE—One pen of China Pheasants, one male and five females. L. R. McCoy, R. I, Box 205 Stockton, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S BULLETIN.

My dear Friends: If you happen to be downtown and see a woman stop "dead in her tracks" before a show window it is a sign she is giving thoughtful consideration to the new styles for spring. Sometimes the sidewalks are impassable for women stopping so to contemplate the modes. This is more and more the case as one store after another bursts into attention with its blossoming windows. And this year the displays are especially compelling.

A gentleman member of the Home Circle family describes the effect of the displays in his own virile manner. He says they "slam you in the eye."

In these times, instead of being jumbled as full of new garments as they can hold, each window is given over to three or four costumes only. Each costume has exclusive use of all the space that the eye can conveniently cover. Thereby each costume is distinctly presented. The principle is the same as the "close-ups" in a motion picture. And moreover the window looks like a throne, not a pit; and the "dummies" in it are paraded with the dignity of queens, and not in the confusion of a mob. Truly the new window dressing believes in the direct and simple appeal.

New sport costumes, more appropriate to this climate than the leather ones, are now being shown. Among them are some that pay deference to the vogue of leather by trimming the collars, cuffs and pockets with that material. Which is probably enough.

In the new costumes for general purposes I notice both princess and two-piece dresses, both fitted coats and box coats, flaring cuffs and deep close fitting cuffs, skirts with both the pannier effect and without; both sleeve dresses and jumper dresses. The side belt is very strongly in favor on all fitted coats. Effective use is made of the buttons, which are very few and applied as pairs.

In the cheaper ready-made spring garments, the general fashion is carefully modified. This is always so in popular-priced garments, only the ultra-fashionable few being depended upon to follow style to its most unreasonable limit. The manufacturers take care not to trifle too much with the common taste, and in the main produce for it a rather sensible and nifty garment. This year I see many of the coat suits in a small and neat black and white check, and following in a general way the cut of the hour.

By the way, I dreaded that it would come—the imitation leather hat. My own taste is against wearing imitations of any material, but the imitation leather I have seen is palpably oil cloth. The imitation is awful. It is awfully cheap and cheaply awful. Don't wear it.

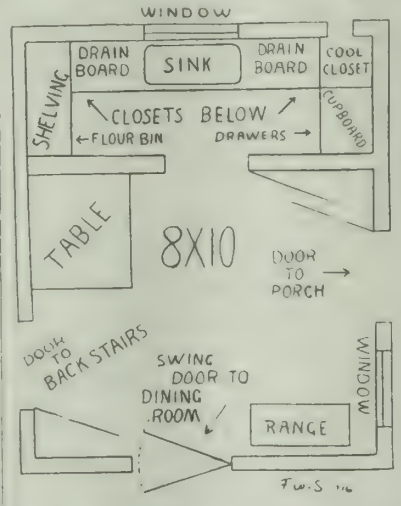
Yours imploringly,

Rosabella Best.

TEACHING MOTHERHOOD.

It has come at last—a college course in motherhood. It is to be at the University of Chicago, with Dr. Marie Mover responsible for the innovation. The lectures will deal with the care of health of girls during their years of growth, their preparation for normal motherhood, care of health while approaching and after motherhood, and care of the infant child.

AN EASILY MADE "BUNGALOW CAKE."



(This Week's Preferred Recipe.)

Those who have tried this cake speak very highly in praise of it. It is used as a double layer cake with any kind of icing or jelly between and on top. Sift 1½ cups flour, 2 teasp. baking powder, 1 cup sugar, and a pinch of salt together very thoroughly; put 1 egg, 3 tablesp. melted butter and 1 teasp. vanilla extract in a cup together, and pour on the foregoing in a bowl and beat all about 5 minutes. Put into two shallow cake pans and bake about 20 minutes.

A PANTRY SUGGESTION.

This sketch is from a reader, F. W. S., who presents it as a practical arrangement of a pantry combined with a small kitchen, and one that is in successful operation.

"It is more convenient than it looks," he writes. "The kitchen is

left for cooking and the pantry is nevertheless right at hand. The door between it and the kitchen can be kept closed, except in the midst of preparing the meal, and the pantry thereby generally kept cool. It takes the place of a large kitchen cabinet, food storage and scullery; and all the dishes, pots and pans ae kept there. Except for the actual cooking of the food, most of the work of the kitchen is done in the small space of the pantry, which is still but a few steps from the stove. We have used this arrangement for four years now, and have not yet found any fault with it."

A GARDEN CLUB.

Why not a garden club in your neighborhood?

The uses of such a club are twofold—to encourage community interest in planting, and to study private gardening.

One branch promotes the planting and caring for trees and beautifying public parks, streets and roads.

The other branch agitates better home gardens. A systematic way to do this is for each member to choose a different plant or flower to experiment with and to report upon to the club. When she has her chosen subject flourishing she invites other members to visit her and inspect it and to exchange views regarding it. Of course at the end of the experiment she brings in a written report to the club for the future guidance of the members.

In this way definite and gratifying results are attained, besides making the club work purposeful for each member.

A CUSTARD OF WORTH.

This custard will go quickly in the making and with enthusiasm in the eating.

Cut and butter on both sides slices of thin bread; quarter, and then cover the pieces as they lie in the bottom of a bowl with one quart of custard mixture. Bake; and when firm spread it with a meringue, which may be browned with the pan put a few moments back in the oven. The custard ingredients are: 1 qt. milk, yolks of 4 eggs, 1 cup sugar, 1 tablespoonful corn starch. Stir the eggs and sugar together and then the cornstarch moistened with a little milk. When they are well mixed stir in the bulk of the milk. The whites of the four eggs are then beaten up, with powdered sugar to sweeten, for the meringue. Good flavors for the custard are orange or almond. Lemon is a flavor liked by some, but for custard a faint amount of lemon flavor goes a long way.

MATCHED MENUS.

Here are some sensible combinations:

With Roast Beef—

Hominy; baked squash or sweet potatoes; spinach, asparagus or brussels sprouts.

With Roast Chicken—

Rice: grape jelly; creamed celery.

With Lamb Chops—

Tomatoes; peas; potatoes au gratin.

With Roast Duck—

Turnips, creamed salsify; sweet potatoes; currant jelly.

With Veal Chops—

Rice in any form; tomatoes; apple salad.

With Veal Stew—

Baked or escalloped potatoes; dumplings.

With Roast Veal—

Rice; spinach, cauliflower or creamed cabbage.

DID YOU KNOW

That gold thimbles are in fashion again?

That tatting bodkins can now be bought in gold and silver and beautifully enameled?

That flour is now made of bananas, lima beans, cassava root, green peas, chestnuts and potatoes, and that it is being more and more used?

SWEET ALYSSUM.

By Sunbonnet Sue.

Has anyone had any other than a happy experience with sweet alyssum? In my garden it shall always have a place.

I have never been disappointed by sweet alyssum. Its graceful masses of snow blossoms wave a friendly recognition to me in summer's heat or winter's rain. It blooms bravely and wants so little.

In our climate it grows like a perennial. Seemingly there is no end to sweet alyssum.

It seems to grow because it loves you. And the more you are cruel to it the more it loves you.

I shear it cruelly when it has bloomed and bloomed and its flowrets are turning to tiny seeds. I grasp its full head of exhausted blossoms and let the blade cut through leaf and stalk. All I leave is a short, stubby stool of bleeding green twigs. The luxuriant sprays in heaps I throw over the fence, but the short stubby stools remain to reproach me, and I can see the bald, bare ground between.

It smacks of sacrifice and farewell to sweet alyssum; the end of its smiling; the abandonment of its cool green and white bed of fragrance. But not so.

In a week, if I water it, all its scars are vanished mid leafage. If I do not water it, the growth goes on. In six weeks it is all a mass of white bloom, a riot of tiny white flowers laughing in triumph.

I do not know how many times a year I cut it. The flowers are so lasting. But I do know that even when gone into seed it lingers and waits ever so patiently to be plagued with the pruner, to repeat blithely its white and green glory.

I love to carpet a spot in my garden with the sweet alyssum that so loves me.

Berkeley, Cal.

EXPERIENCE EXCHANGE.

We are indebted to J. W. MacL. of San Martin for this chocolate pudding, one of the best steamed puddings ever: ½ cup sugar, ¼ cup butter creamed together; ¼ cup cold water; 1¼ cup flour and 1 large teasp. baking powder sifted together two or three times and add 2 teasp. ground chocolate or cocoa and sift again; 2 eggs beaten very light, and a pinch of salt; raisins and walnut meats chopped fine may be added. Steam 1¼ hours—don't let water stop boiling, keep covered while cooking. A good sauce is made of 1¼ cups water, 1 cup sugar, butter size of an egg, pinch of salt; flour to thicken, mixed with the sugar, about a dessertspoonful; let these ingredients boil up and then add a beaten egg and cook until thick enough.

THE WEEK'S BEST HOUSEHOLD HELP.

To have paste that will paste—Take half and half starch and flour and add to a little boiling water. Let it stand a minute, add more water, cook and stir till thick. It is supposed not to mold after use. To make it keep some time add a few drops of oil of cloves.

LIKE MARY USED TO SMILE.

By John Quill.

I saw a couple walkin'
Out in the park one day,
The fellow was a-talkin',
Girl hadn't much to say;
He'd emphasize his subject,
An' ev'ry little while,
She'd sorter smile up at him,
Like Mary used to smile.

A kind of soothin' sweetness,
I never can forget,
Delight o' joy in livin',
I see her sweet eyes yet;
A lot of folks are praisin'
Such things as dress an' style,
But all that's true is smilin'
Like Mary used to smile.

I feel so kind o' lonesome,
A-goin' through this world,
A dizzy-like sensation
Has got me sorter whirled;
They're gettin' few and fewer,
But yet, once in a while
You'll see a girl a-smilin'
Like Mary used to smile.

I've ben so weak, here lately,
Ain't felt like doin' much;
I don't feel good for nothin'
Like doin' chores an' such;
Last night I was a-dreamin'—
Could see a thousan' mile—
I saw an angel smilin'
Like Mary used to smile.

—Christian Herald.

MRS. JINKS ON BEQUESTS.

By B. Fairfield.

Yes, Polly—say, don't peel those potatoes so thick—yes, that frame with the human hair picture in it was left us by Mr. Jinks' grandma—you can waste a bushel of potatoes a year if you don't peel 'em thin—and it's a family relic, not to say hair-loom. I've got the house full of things bequeathed to me.

And then again, there's things been bequeathed to me that ain't in the house. No, ma'am. Not in the house; nor even in the woodshed, where that frame would be if it wasn't mostly Jim's. Some of the articles I've been remembered with by the deceased weren't quite a melancholy comfort — unless you count a log-cabin quilt from my sister Lou, poor soul, which she made with her own hands between raising a passel of children and was sure melancholy enough although not strictly a comfort. Of course I cling to that, though it's the worse off for years of service. I've got it on my own bed—between the mattress and the springs to keep the ticking from getting rusty, which it will do in this climate.

I've been remembered a lot with such things. Not that I'm above money and jewelry, but that was the last thing they always thought of giving me. No, I take that back—the last thing they always thought of giving me was some personal token. "Of no intrinsic value" as the saying goes, "but treasured for its associations." That reminds me I'd better take it out of the trunk up stairs and send it to Belgium—that cork leg I inherited from Cousin Wesley in 1904.

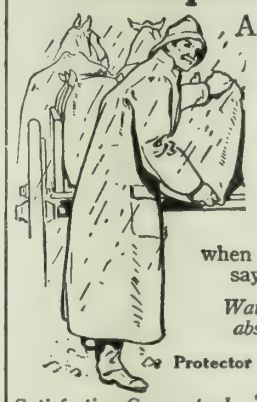
The nearest I ever came to getting something I could make use of myself—quarter 'em when they're that size, Polly — was when Aunt Gusta died. I was always her favorite and did most of her sewing for her. About eleven months before she died she married her fourth husband—she'd buried the three others. A nice man Hector was, and used to go with her to the cemetery with her and carry the flowers she regularly put on the three graves. It was a large lot and had room for another grave; always thoughtful and provident, Aunt Gusta was. Had all the gravestones alike, with no extra cost for designing after the first one. Well, she surprised everybody, including Hector, by going before him, and he was intelligent enough to order the favorite style of gravestone. He wrote me a tear-blistered letter—just shift the lid a little on that stew-pan and the spuds won't boil over—stating that Aunt Gusta remembered me to the last and he was sending a whole trunkful of stuff that she insisted I must have. He was sending them, much though he prized them himself.

Of course I could hardly wait until the bequest arrived, and when it did it took two men to lift it off the wagon. It was as heavy as a coffin itself. I got Jim to bring the hatchet, as the key hadn't been sent, and we cracked it open. Was I feverish? Well!

She'd remembered me all right. You know if there is one foolish passion I have, it is for fine corsets. The trunk was full of them—all of them the best ever made. They were hers, and except that she weighed 220 pounds and you know what a slat I am it was perfectly lovely of her.

Oh, well. I don't believe in wasting anything after a person passes away either. There's Jim. But he's got such a little neck I don't to save me know who I'll find to give his collars to. He wears a No. 13—goodness, here we've let the water boil away and scorch the spuds!

Taking Due Precautions.—Little Albert, son of a minister, was intensely afraid of thunder. One afternoon in July he was caught in what promised to be a severe electrical storm. His father saw him dash for home, and noticed that his lips were moving as he ran. As he got safely into the house his father soothed his fear and then asked: "What were you saying, Albert?" Albert shuddered. "Oh!" he replied, "I was just reminding God that I am a minister's son."



Unexpected Reply.—A Scottish minister was one day talking to one of his aged parishioners, who in the course of the conversation ventured to express the opinion that ministers ought to be better paid. "I am glad to hear you say that," said the minister. "I am pleased that you think so much of the clergy. And so you think we should have bigger stipends?" "Ay," said the old man; "then we'd get a better class of men."

Measurement. — London Householder—Not many people away holiday-making in war time, I suppose, milkman? Milkman — Well, mum, you'd be surprised; at least five gallons of my customers were away last week-end.—London Punch.

Getting a Supply. — Visitor — Is this all the soap there is in this room? Landlady — Yes, sir; all I allow you. Visitor—Well, I'll take two rooms. I like to wash my face in the morning.—Philadelphia Public Ledger.

Wonderful Result. — "Was your garden a success last year?" "Very much so. My neighbor's chickens took first prize at the poultry show."—Phila. Record.

GRAND PRIZE
In awarding the grand prize to Ghirardelli's Ground Chocolate, the Panama-Pacific International Exposition confirmed a popular verdict. Ever since its introduction in the early seventies this appealing, health-sustaining beverage
Ghirardelli's
Ground Chocolate
has stood supreme in the homes of the West.
It is most convenient in form and economical in use. It comes to you in an hermetically sealed can that safeguards its native purity and delicious flavor. Order a can from your grocer today.
In ½-lb., 1-lb. and 3-lb. hermetically sealed cans. There's a double economy in buying the 3-lb. can.
D. GHIRARDELLI CO.
Since 1852 San Francisco

The Markets.

Unless otherwise noted, prices quoted are f. o. b. San Francisco.

San Francisco, Jan. 26, 1916.

WHEAT.

Coast prices are showing the influence of conditions in the East, where the market has been soaring this week, owing to export sales and adverse weather conditions, and local values have been marked up sharply. The new prices, however, are not favored by local buyers, and business here is very quiet.

Cal. Club, ctl.	$1.80@1.85
Northern Bluestem	1.95@2.00
Northern Club	1.80@1.85
Northern Red	1.85@2.05

BARLEY.

Values are steadily held at the old level, with a firmer feelng, as buyers are taking a little more interest, and there is some anticipation of better prices. A heavy rail movement to the East has had quite a stiffening effect on the market.

Shipping, ctl.	$1.35@1.37½
Choice Feed, ctl.	1.30@1.35

OATS.

No change is noted, and the local market is quiet except for the usual jobbing business in red feed.

Red Feed	$1.30@1.35
Red Seed	1.45@1.65
White	1.45@1.50

CORN.

Local prices are well maintained, but unchanged. There is a fair demand for Eastern yellow, with good California selling at about the same price; and Egyptian, etc., continue in good demand for feeding.

Eastern yellow, ctl.	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.65@1.70
Egyptian	1.45@1.55

BEANS.

There is little new in this department at present. Trading has been rather quiet, and as there was little movement of limas and cranberry beans at the recent advance, the prices show a slight recession. Other lines are quite steadily held, and reports from the interior indicate a strong undertone to the market, with prospects of a good movement by next month. There is little stock left in growers' hands in the valley district, and stocks in general are rather light.

(On wharf, San Francisco.)

Bayos, per ctl.	$5.00@5.10
Blackeyes	3.60@3.70
Cranberry Beans	4.75@4.85
Horse Beans	3.25@3.50
Small Whites (south)	5.80@5.90
Large Whites	5.75@5.90
Pinks	4.30@4.40
Limas (south)	4.50@4.60
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65

RICE.

The Pacific Rice Growers' Association reports a good-sized sale at $2.05 per ctl., an advance of 5c, with a quiet but firm market both here and in the south. Buyers are waiting to dispose of the cleaned rice, and it is believed that the movement would be retarded rather than stimulated by lower prices.

SEEDS.

There is not much movement in the cover-crop lines quoted, but alfalfa is receiving a little more attention, and the miscellaneous garden seed business is active. Values show little change.

Alfalfa, per lb.	18 @19 c
Melilotus Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

Supplies are comng forward a little better, but are still short and the demand is strong. The small shipments are due to shortage of cars as well as to adverse weather. There is a heavy demand at outside points, both south and north, as well as in the interior, and with prospects of a continued shipping business country stocks are more firmly held. Offerings of alfalfa are light, with a good demand.

No. 1 Wheat	$12.00@15.00
No. 2	10.00@11.50
Tame Oats	10.00@16.50
Wild Oats	8.00@11.50
Alfalfa	10.00@14.00
Stock Hay	6.00@ 9.00
Straw, per bale	.25@ .40

FEEDSTUFFS.

With diminishing supplies of alfalfa hay, alfalfa meal continues to advance. Rolled barley also is a little higher, and recent shipping business in the whole grain indicates that continued firmness may be expected. The general market for feed is firm and active.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.00@22.50
Alfalfa Meal, per ton	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	25.00@26.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	39.50@40.50
Middlings	32.00@33.00
Rolled Barley	28.00@29.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

The market is in rather unsatisfactory shape, as the bad weather continues to retard buying, while causing a large proportion of the offerings to be of unattractive quality. Good stock, however, generally brings rather high prices. Strawberry rhubarb is now coming in, and sells as high as $2 per box. Southern peas and beans are easy, with no first-class stock offered, while peppers are higher. Tomatoes also have advanced very sharply, with few coming in, and eggplant is considerably higher. Celery shows a wider range, according to quality, really good lots being higher. Lettuce is weak, with an abundance of poor stock, little of which sells above 75c.

Cabbage, ctl.	35@50 c
Cauliflower, doz.	35@75 c
Sprouts, lb.	3@ 4 c
Rhubarb, box	$1.00@1.25
Strawberry Rhubarb	1.75@2.00
Peas, southern, lb.	.05@ .10
String Beans	.08@ .10
Peppers, bell, lb.	.10@ .15
Tomatoes, L. A., crate	1.75@2.00
Eggplant, lb.	.08@ .10
Celery, crate	2.00@3.00
Artichokes, doz.	.50@1.00
Lettuce, small, crate	.50@1.00

POTATOES AND ONIONS.

Delta stock, both potatoes and onions, is somewhat higher, with light supplies. There has been a shortage of potatoes throughout the country, and stock in the Northwest, which is usually available here, has gone to other markets. Onions also are in demand in the East, and local stocks are running low. Australian stock will be coming in soon.

(On Wharf.)

Oregon Burbanks	$1.60@1.85
Salinas Burbanks	2.00@2.10
Delta Burbanks	1.50@1.90
Sweet Potatoes, ctl.	1.35@1.90
Onions, Delta, ctl.	1.85@2.25
Oregon	2.00@2.50
Garlic, per lb.	10@12½c

POULTRY.

Values stand as before on all lines. The local demand is rather light, but no great quantity of Eastern stock is appearing, and local shipments have not been unduly large.

Turkeys, dressed	24@30c
Live Turkeys, lb.	20@21c
Broilers, 15 lbs. to doz. and less, lb.	32@33c
do, over 15 lbs. to doz.	23@25c
Fryers	22@24c
Hens, extra, per lb	17@19c
Small	17@18c
Smooth Young Roosters, per lb.	17@19c
Squabs, per doz.	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb	18@19c
Old	14@15c
Belgian Hares	9@11c

BUTTER.

Extras have shown no change whatever through the week, being the same here as at Los Angeles and somewhat lower than last year. The lower grades are a little stronger, but the market shows no feature of much interest at the moment.

	Thu	Fri	Sat.	Mon	Tu.	Wed.
Extras	28½	28½	28½	28½	28½	28½
Prime Firsts	27	27	27	27½	27½	27½
Firsts	25	26	26	26	26	26

EGGS.

Last week's storms caused a sharp curtailment of supplies, sending prices the first of the week to an unusually high level for this season. Since then, however, both grades have come forward much more liberally, and prices are again on the down grade, though higher than a fortnight ago.

	Thu.	Fri.	Sat.	Mon	Tu.	Wed.
Extras	33½	32	37	43½	35½	33
Sel. Pullets	31	31	35	42½	33	31½

CHEESE.

Flats are coming forward in good shape, and have dropped back 2c, while Y. A.'s have gained ½c on light arrivals, and Monterey cheese is firm, with light offerings.

Y. A.'s, fancy	17½c
Fancy Calif. flats, per lb.	16½c
Monterey Cheese	17@18c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	28½	28½	28½	28½	28½	28½
Eggs	35	35	33	33	33	33

DECIDUOUS FRUITS.

Local buyers are taking no very active interest in apples, and there has been no shipping movement of much consequence of late. Supplies, however, are not considered excessive, and values are steadily held on desirable lots.

Apples, Cal. Newtown	$ .75@1.25
Pearmain	.65@1.00
Greening	.65@1.00
Baldwin	.75@1.25
Oregon Spitzenbergs	1.50@2.50
Jonathan	1.25@1.75

DRIED FRUITS.

While prices here show no quotable change, the market seems to be picking up a little in consuming markets, with a few more inquiries received by local holders. The latter have not yet gone out after new supplies to any great extent, but attractive offerings of most varieties should be salable without difficulty. It is understood that practically the last available lot of California figs has gone East, and all markets are very short of this fruit. Prunes are very firm, and while the local movement is not heavy there is an increasing demand from the East for the large and small sizes, which are closely cleaned up. Apricots are dull for lack of demand. Peaches find less demand than most other fruits, but stocks on the Coast are comparatively light, and there is no disposition to shade prices, the shortage in other lines assuring a cleanup before the season is over. This should give a clear field for the new Association, which is getting things well lined up for next year. Muscatel raisins are moving to England from New York, and there is a fair demand here. The New York Journal of Commerce says:

"Coast prunes continue strong, with buyers showing a good inquiry, and purchasing on the part of the operators displaying a slight increase. The New York buyers, however, continue slow in purchasing, and the actual volume of buying done on the part of the local trade for future Coast shipment is comparatively light.

"Spot California prunes are firm, with the smaller sizes very scarce. A moderate buying is in progress in

THE HOG THAT BRINGS MOST MONEY.

[Written for Pacific Rural Press by R. M. Chaplin, Farm Advisory Dept. Western Meat Co.]

The price of hogs in San Francisco, as well as in any other market, is largely determined by supply and demand, yield and quality. To a certain extent yield and quality go hand in hand, and if hogs have a high yield it will be of prime pork. It will be absolutely necessary for California ranchers to produce pork of equal quality with Eastern farmers in order to command equal prices when conditions are such that our requirements of pork are supplied by our own ranchers. It is therefore necessary that extra stress must be laid on efforts to improve the quality of hogs, and with this end in view we are advancing our price on top hogs to 7¼c, making the spread 175 to 250 pounds, as we believe this will be an incentive to hog-raisers to hold their hogs until they put on extra weight rather than sell them off in an immature condition from 100 to 150 pounds.

There is very little money in raising and marketing light hogs —these are bringing considerably lower prices than heavy hogs, and if raisers can get one-half or 1 cent a pound more by putting on an additional 40 to 50 pounds' weight, they should do so, as the extra weight they put on is sold at a profit and at the same time they are realizing a higher price for the total weight.

With present prices of feed stuffs, pork ought to be grown at not over 5 cents a pound, and hogs weighing 130 to 140 pounds, if properly fed, should put on a pound and a half per day, so that with a month's feeding, hogs weighing from 130 to 140 pounds, and worth 6½ cents on the San Francisco market, will bring 7¼ cents per pound if their weight is increased to 175 to 200 pounds.

Special Live Stock Market Report.

The cattle market here is in about the same condition as reported last week, with the exception of a shaving of price on dressed heavy cattle, which are selling as low as 10 cents. Everybody here seemed to have plenty of cattle on hand to supply their trade, while the railroads were tied up and shipping conditions are back to normal again. The hay shortage in Nevada is becoming acute and feeders there will not be able to hold as long as is customary. About 2500 feeders have been shipped into this State from Nevada points and put on green feed, from where they will be turned off as grass cattle next summer.

While not quotably higher there is a stronger feeling in the mutton and lamb market and a little higher price on dressed mutton and lambs is expected any time now. Reports from the valleys indicate that there have been heavy losses in lambing in the river districts. The wet weather which has prevailed all over the State this month has undoubtedly made inroads on the lamb crop and has not been conducive to good feed.

As will be noted in another column of this issue one packer in this city is offering a premium on hogs weighing 175 to 250 pounds. This should encourage farmers in holding back their hogs and being more liberal with the grain sack. Hogs are not being offered freely at this time in this market, due perhaps to the great amount of green feed now available. This is good policy and should be continued. The feeling in Chicago the past week has been somewhat weaker and prices have been cut a trifle. The runs however continue heavy.

WOOL.

There is considerably more activity in the local market than has been evidenced for some time, especially in fleece wools. As a result the market has been braced up on three classifications. The market at Boston has a strong tone and the tendency is toward higher prices. This is attributed to the improvement, previously reported in this column, of the European markets as well as to the general prosperous condition in this country.

several quarters, and interest appears to be growing, after being very dull during the after-holiday lull.

"Coast peaches and apricots are very quiet, with advices reporting a slow demand in all quarters. However, the limited stocks in the hands of packers maintain the general tone of the market on a very firm basis.

"A good inquiry continues for California raisins, and the prices are held on a firm basis. English operators, who have bought heavily since the first of the year, are still in the market."

Apples	6½ @ 7½ c
Apricots, per lb.	9 @ 12 c
Figs, white	5 @ 6 c
Black	3½ c
Calimyrna	8 @ 10 c
Prunes, 4-size basis	5 @ 5½ c
Peaches	4½ @ 6 c
Pears	4 @ 7 c

(Associated Raisin Co. Prices.)

Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50-lb. box	2.75

CITRUS FRUITS.

The eastern auction sales report higher prices for oranges, which are caused by light shipments received and on the way. The rains of the last two weeks have caused very light shipments from California, but with bright weather the southern part of the State will send east several hundred cars daily. The lemon growers report that crop to be in fine shape also.

On the New York auction, Monday, Jan. 24th, oranges averaged from $1.95 to $3.30 per box, and lemons brought from $3.10 to $3.85. At Chicago the same day oranges averaged from $2.50 to $3.75, and lemons $3.75 to $4.25 per box. Shipments for the season are almost 1000 cars less than they were a year ago.

Oranges have been in better demand in the San Francisco market than most other fruits, but the movement is not heavy. There is quite a lot of export business, however, which in conjunction with Eastern trade is the determining factor, and dealers are looking for an early advance in navels. Tangerines already have been marked up a little. The top figure on grapefruit is a little lower.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50 @ 2.75
Tangerines	1.50 @ 2.00
Grapefruit	1.75 @ 2.25
Lemons, box	1.50 @ 3.00
Lemonettes, box	1.25 @ 1.75

HONEY.

Values show no quotable change, but most of the supplies held here have now been absorbed, and there is quite a bit of demand, in view of which there is a decidedly firmer tone to the market.

Water White, comb	13 @ 15 c
Amber	8 @ 12 c
Water White, extracted	7 @ 8 c
Light Amber	3 @ 4 c
Dark	2 @ 2½ c

NUTS.

The nut situation is unchanged. California walnuts are entirely nominal, with nothing offered, while the trade is fairly well supplied with Oriental stock of very ordinary quality. Almonds are getting rather scarce, but there is no real shortage, and the movement is almost entirely in small lots.

(Prices f. o. b. San Francisco.)

Almonds (1915):	
Nonpareil	15 c
IXL	13½ c
Ne Plus Ultra	13 c
Drakes	11 c
Languedocs	11 c
Walnuts (1915):	
Budded, per lb.	17½ c
No. 1	14 c
No. 2	11 c
Jumbo	17 c

LIVE STOCK.

Further changes are noted in the classification of hogs. Light stock is in ample supply and a little easier than last week, and hogs under 175 lbs. show no unusual firmness; but stock between 175 and 250 lbs. is wanted by the packers, and good stock brings quite an advance. Quite a lot of lambs have been shipped in lately from the north. Sheep are scarce in California, and the market is firm.

(Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, S. F.)

Steers, No. 1	6¾ @ 7 c
No. 2	6¼ @ 6½ c

WOOL.

(Prices paid in the country.)

Sacramento Valley, lb.	16 @ 17 c
Southern, year's staple	13½ @ 14½ c
Six months	12 @ 13 c
San Joaquin (defective)	9 @ 10 c
Northern, free	12 @ 15 c
S'thern Mountain, free	12 @ 13 c
Tehama Co., free	13 @ 14 c

HORSES.

This week has been the most active for some time in the local horse market, a number of good sized offerings coming in from various parts of the state, and including a wide range of weights and classes. Heavy, gentle-broke stock in good condition found ready sale, both for local and country use, and there has been some demand even for the less desirable offerings, though it is hard to get satisfactory prices for such offerings. There is considerable demand for mules at present in the country.

(Approximate values at San Francisco, based on auction sales.)

Drafters, 1700 lbs. and up	$200 @ 225
Drafters, 1550 to 1650	150 @ 200
Chunks, 1350 to 1500 lbs.	150 @ 175
Wagon horses, 1050 to 1350 lbs.	110 @ 150
Green Mountain range horses, 950 to 1200 lbs.	20 @ 75
Farm Workers	50 @ 100

GROCERIES.

Flour has again been marked up, in sympathy with the sharp advance in wheat. Other staples show no great change at present, though practically everything in the foodstuff line is firm. Coffee is coming in more freely, and may ease off a little.

(Wholesale prices, San Francisco.)

Flour, Family Extras, per bbl.	$6.40 @ 6.80
Sugar, granulated, per lb:	
Cane	6.30c
Beet	6.11c

WANTED

ABOUT

20 Good Farmers

who have the "Pep," are tired of working for others, and wish to acquire land of their own. Land is in Tulare County, between Pixley and Spa, mostly graded and checked, and has been in Rice last year, producing from 30 to 40 sacks per acre. Also good for grain, fruits or alfalfa. Electric pumping plants, reservoirs, ditches and buildings. For rent on shares, or sale on crop basis, on long terms.

Address: R. C. Fairall, Pixley, Cal., or R. Schiffman, owner, Chamber of Commerce Building, Pasadena, Cal.

The 1915 almond crop was the largest ever produced.

The Exchange sold the last of its 1915 crop on January 15, 1916---demonstrating that this strong co-operative association can successfully finance and market any crop.

Almond growers not affiliated are invited to co-operate for mutual benefit by becoming members. Full information will be given upon request.

San Francisco.

Publisher's Department

WANTED A WIFE—is the heading of an advertisement sent us this week by a farmer living in Colusa county. We returned the writer his money and the ad. as we are not running a matrimonial bureau. However, for the benefit of our young lady readers who may feel aggrieved, we will forward any letters to the gentleman that may be sent to this office. The advertiser stated that he was a young man, good looking, brown eyes and dark hair. He wants a housekeeper, from 18 to 24 years of age—doesn't say anything about nationalty, color nor beauty. Write to him, girls, care of the manager of Pacific Rural Press, and your letters will be forwarded.

The book department reports heavy sales these days. Orders coming from all parts of the State and in fact from all over the world. In number of sales our California Fruits still lead, with California Flowers and California Hog Book running a race for popularity. Our two books of 1000 Agricultural Questions Answered in each, and California Poultry Practice are in a class of their own and we sell lots of them.

In writing to Mr. Guilford, Ralph D. Robertson of Willows, one of the best agriculturists in the U. S. Service, says: "I have read your 'California Hog Book' with much interest and shall continue to enjoy it. It strikes me as being extremely practical." This book is published by the Rural Press and will be sent postpaid for $2 per copy.

Announcing the $750 RUMELY "8-16" CASH F.O.B. LA PORTE

THIS new Rumely model has met with instant success because it fills *all* requirements for a small farm tractor—and it is built by a company that *knows how.*

It is strictly a one-man outfit—tractor and plows are combined in one machine, and the control of the entire outfit is from the operator's seat. With the Rumely you plow just the same as with a horse gang—the plows are where you can see them and you know how the outfit is working every minute. You can back with your plows, make short turns and cut square corners.

Besides plowing, this tractor will pull your discs, harrows, mowers, drills and binders—it will operate your silage cutter, hay baler, corn sheller, small separator and feed grinder. In fact, handle all your power jobs, draw-bar or belt. When used for other than plowing, plows are quickly detached.

Note These Features

Control—Full control of entire outfit from operator's seat.

Enclosed Gearing — *Every gear a steel gear and all cut gears excepting bull gear—all gears encased and running in oil, including bull gear.*

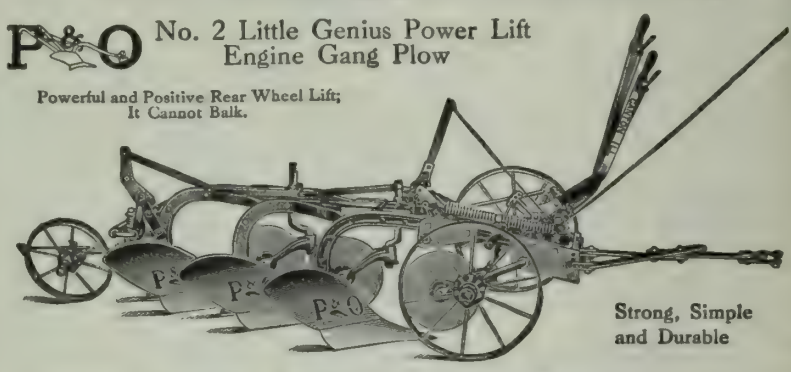
Roller Bearings — Roller bearings exclusively used throughout.

Heavy-Duty Engine—Four-cylinder, heavy-duty engine—*Rumely made.*

Durability—Rigid I-beam frame construction.

No Extras — Prices are for tractor complete with plows.

We make the same design in a three-plow tractor—"12-24." Price $975.00 cash, f. o. b. La Porte. Send for a catalog completely describing this new Rumely model.



ADVANCE-RUMELY THRESHER CO.
LA PORTE (Incorporated) INDIANA
San Francisco, Cal.

P&O Little Genius Engine Plow

The most successful small sized engine gang plow made; complete and perfect. We want to send you a copy of the many testimonials we have received from all over the country; the strongest endorsements ever given an engine gang plow. The record of the P&O Little Genius is an unbroken series of successes and it is today the most popular engine plow of this type on the market.

P&O No. 2 Little Genius Power Lift Engine Gang Plow

Powerful and Positive Rear Wheel Lift; It Cannot Balk.

Strong, Simple and Durable

Two, three and four bottoms, 12 or 14 inch; all standard types. One man operates both engine and plow. Power lift in; power lift out. Power lift operates all three wheels, giving high, level lift. Hitch adapted to all types of tractors. Wood break pin protects both engine and plow against injury. Bottoms leave straight headlands. Has strength to spare. "It's the Way We Build Them."

Write for circulars and catalog. Explain your plow problems to us; we can give you valuable information. We make a P&O Engine Plow that will meet your requirements.

P&O Light Draft Plows Are Backed By An Unqualified Guarantee

That Means True Economy!

THAT triangle trade-mark never appears on steel or common iron culverts; you will never find it on "good enough" flume or culvert sections. It is the recognized stamp of quality. It means honesty of manufacture and the assurance of long-run economy and service that will continue long after you have forgotten the price of

"ARMCO" AMERICAN INGOT IRON CULVERTS

Why? Because ARMCO IRON RESISTS RUST. It is *pure* iron of even and uniform texture through and through. It is practically free from the gases and impurities that cause steel and ordinary iron to rust out in spite of galvanizing.

Look for that trade-mark on every section of Culvert. If it is not there the culvert is not the genuine ARMCO (AMERICAN INGOT) IRON, and will not give the greatest service for the money expended.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Armco Iron Culvert Mfrs. Association

Fruit Growing in Imperial Valley.

With wise selection of soil and varieties, Imperial Valley's freedom from disease, cheap water, which renews fertility, her early season, and her market facilities make fruit culture a most promising pursuit.

[Written for Pacific Rural Press.]

THE fruit grower's opportunity in Imperial Valley is unique and large, yet limited. A new land, uninfested by the horde of insect and fungus troubles which make fruit-growing so costly or uncertain in other sections, she bids fair to remain free. Her 300,000 acres, irrigated with cheap and plentiful water, are isolated from infection from the rest of the world by a wide border of desert, which rises like a yellow blanket against the dark background of equally unfruitful mountains, which all but encircle the Valley.

The county horticultural commissioner is keenly alive to the dangers which may be encountered in every importation of nursery stock or seeds, and the county supervisors have provided him with laws and inspectors by which "we will keep the county free from insects and diseases if it is humanly possible." Telephones and good roads help make it possible to quickly stamp out any infestation that might occur.

Due to the dry, hot climate, with very few inches of rainfall per year, and a summer temperature which sounds more oppressive than it is, perhaps most of the fungus diseases cannot live, even if introduced. Grape mildew is very likely one of these, and varieties, such as Purple Damascus, are grown free from disease. Sulphuring and spraying are unknown in Imperial Valley fruit culture. Add to the disease immunity, a temperature that warms up so early in spring that the Valley gets fruit to market ahead of all other points, an efficient railway service, and government men giving marketing aid, and you have conditions prime for profitable production of early shipping fruits, whose trees thrive through the hot summer.

Harvesting Table Grapes in the Imperial Valley.

Experiments with practically all kinds of fruits have been made in various parts of Imperial Valley ever since the water came, about fifteen years ago. We give the general conclusions of those most competent to judge.

With the exception of dates, citrus fruits, olives, and Winter Bartletts, only early fruit is profitably marketable.

Dates Popular.—Dates are still an experiment, though there is much enthusiasm which has led to the planting of considerably more acreage of seedlings in various parts.

Pomelos Best Citrus Fruit.—Oranges are not favored commercially because they are not often very prolific, and usually have grown "raggy" and tough, though with what to some is a delicious sweetness, excelling oranges from other parts of California. At least one rancher, who has a few trees bearing an abundance of tender fruit, claims that the ragginess is largely due to the poorer cultivation and fertilization, which most Imperial Valley oranges get. Small but thrifty lemon orchards are encountered here and there, but enthusiasm is not high.

In grapefruit, Imperial Valley seems to have the lead of California, for the many trees already producing show heavy yields of fruit superior to that from the rest of the State and comparing favorably with that from Florida. The orchard most talked about is one of 108 trees of Marsh Seedless, planted in long rows between oranges and lemons. It paid $2560 last year to its owner, who last spring planted sixty-odd acres to grape fruit and budded over some of his oranges. The 108 trees already bearing were never pruned until this winter, and received rather indifferent care. One man this year will plant 160 acres, and everywhere one goes in the Valley, he finds large numbers of plantings two acres and upward. The Imperial Valley fruit is sweeter than is commonly found; the bitter is less pronounced, the rag is tender, and altogether it is as desirable to eat without sugar as the average western orange.

Olives are not much known, but the isolated trees seem to thrive and bear.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., February 1, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.58	25.42	24.81	50	32
Red Bluff	59	16.39	14.13	50	30
Sacramento	1.00	14.55	10.93	50	34
San Francisco	1.66	21.95	12.77	56	38
San Jose	1.28	13.88	9.19	54	28
Fresno	.89	8.61	5.20	58	32
Independence	1.60	9.47	5.12	52	—
San Luis Obispo	4.28	22.63	10.68	60	36
Los Angeles	3.02	17.61	8.18	58	38
San Diego	—	——	5.25	56	38

THE WEEK

We were not so far wrong last week when we fancied that the weather prophet might send us Alaska weather. That has not happened so far, fortunately, but one thing seems to be established, and that is that our weather has been mis-sent to Alaska. Last week it was telegraphed from Southern Alaska that "no snow had fallen, there had been no ice up to the middle of January, and children were attending school barefoot." No doubt our real-estaters will soon be subdividing for date-growing up there. That all may have an even chance, we do not mind saying that it was at Sarnak that the kids were barefooting — and the name sounds as balmy as Egypt.

Southern California has had more than her share of weather troubles, though, fortunately, no very low temperatures have fallen. It has been rather an excess of warm water, troublesome widely, but most destructive below San Diego, just about where you get to Mexico. Sad injuries and life losses have befallen a section which is proverbially calm and salubrious—and all so unexpected, too, for it is a country where the trouble is to fill the reservoirs—not to make them hold the water. The sad lesson should not be forgotten; it is not safe to live in the pathway which reservoired water may require.

As we write, the storm area seems to have swung free from the State, and the customary winter sunshine of California resumes its hold upon sky and earth. There are all kinds of possibilities for February weather, although February temperatures are fairly constant. It is the great planting month. Though too late for wheat in most situations, it is in the range for nearly all other field and garden plants, except those intolerant of frost, and, with the soil moist to the very bottom of it, 1916 should be a year of great production and prosperity.

What Makes California Great?

We delight to devote a little space now and then to the views of non-Californians upon what is characteristic of the State, for we all live so close to California that we may not see clearly the State in perspective, which gives the truest view of it. Five years ago Charles H. Gaunt was sent to San Francisco to increase the efficiency of the Pacific Coast division of one of the great national telegraph companies. He was manifestly a man of achievement and discernment, or he would not have been put upon the task, and now he has returned to the East to bring a central division up to the efficiency he has established here. Such a man's judgment of California is worth knowing for the better understanding of our own problems. At a leave-taking tendered to him last week, Mr. Gaunt said, among other things, these:

"For five years I have tried to be some small part at least of the life upon the Pacific Coast. I have studied its people and their activities, and have marveled at their energies and their understanding. The attributes of its people have brought an empire to the Pacific Coast, and because of them it must endure and flourish until it transcends in power and beauty all other empires. The loyalty of the Pacific Coast is not climatic, nor is it inherited. It is spontaneous. Not the loyalty of blind obedience, but the loyalty that places each man's shoulder against the wheel to combat the common foe, and keeps the shoulder against the wheel to support the common cause."

It is then the California people which make California great, not by idling under its manifest natural advantages, but by standing together, for or against, as the truth may require. All seers emphasize the loyalty—the solidarity of Californians. Let this product of pioneer life live in coming generations.

What a Canny Scot Did with Grapes.

Now that we hear so much about protecting vineyardists from farther disappointment in pursuing an unprofitable industry, and so much also about the plungers who have been broken up by pursuing it unwisely, it is at least interesting to hear of a man who filled up a savings bank with the earnings of his vineyard. It is announced that the late John Muir, the Sierra scientist and literateur, who was supposed to have died nearly penniless, because neither sciences nor letters have much standing in wealth-winning, really left quite a snug fortune. Instead of having lived under temptation to break into a bank, he had really been filling several banks—all unbeknownst to his relatives.. He left a fortune of a quarter of a million. Of this, $185,000 was in cash deposited in various banks. The money, explains his daughter, Mrs. Hanna, was laid away when her father took ten years from his work as a naturalist, and devoted his time to the cultivation of his vineyards, which were deeded to him by Dr. John Strenzel, his father-in-law, who was a Polish revolutionist, who, escaping from exile in Siberia, came to California, settled in Alhambra valley near Martinez. We remember him very well from 1875 to the close of his life, but he had done things long before that date, for he showed the first California raisins at the State Fair of 1863, and was wise in California fruit-growing when the first great push for greatness came to our fruit industry in the latter '70s. When Muir won Dr. Strenzel's daughter for his wife, he not only captured a reigning rural belle (for we remember her as very gracious and popular), but won the father also, for he gave him his vineyard and its appurtenances. It appears that during his decade as a vine-grower, Muir kept putting away this five thousand a year of grape profits in savings banks, depositing altogether $50,000. This is the deposit which grew to nearly $110,000 by compounding interest, and kept on growing after Muir's death several years ago. He made money with grapes, not only during the decade mentioned, for his biographer says: "He never quite ceased to be the rancher and become entirely the naturalist."

Perhaps This Is Not So Canny.

The prohibitory law in the State of Washington seems to be stirring up the local millionaires, and they are reported to be making preparations to move. Three of them have declared their intentions to move to San Francisco. This is the condensed news record of it: Their homes in Seattle were recently raided by Sheriff Robert Hodges under the new prohibition law of Washington. From the cellar of one of them the Sheriff took $10,000 worth of rare vintages, some of which had been acquired originally by his father. From the $50,000 home of another a thousand dollars' worth of wine was taken, and from the home of a third two thousand dollars' worth was thrown out. These three men became millionaires by the lumber and cement routes, and they had laid up much domestic bric-a-brac of a liquid character for use in coming days. Their claim is that it had been purchased long before the prohibition law went into effect and that their property was taken from them without due process of law. But without waiting to recover, they propose to move to San Francisco, where sheriffs do not have such plenary powers. Of course, there is a question of how safe they will be in California, for the prohibition army proposes to make a more resolute drive on the public throat during the current year, and no one can tell how they may plug it up. Perhaps it would be more canny to store wine by aeroplane above the three-mile altitude. It is cool enough up there and more readily shifted than from a cellar.

The Rangers Go Forth to Fight.

Perhaps the broadest and sharpest issue which has ever arisen in this country between production and distribution is that which has been pending for several years between the great range and the great packing interests. Though they have fought for years, and have won some victories, and have entrenched themselves in some co-operative institutions, and have worked their guns for transportation and distribution from these platforms with more or less success, the range interest still feels itself assailed, beaten and robbed by the great packing institutions which they call trusts and unholy combinations against fair play for producers. Our immediate interest in this old conflict is that the fight is to be put on in the immediate future with re-doubled fury. At the great rangers' convention (which is the more intelligible name for the convention of the American Live Stock Association) at El Paso last week, the committee on marketing conditions issued a statement in which it was charged that the packing interests are in control of practically all the stockyards and terminal facilities. "In a large measure," the statement sets forth, "they are in control of the

banks and cattle loan companies at the market centers. Under these conditions, it is impossible for the seller to meet the buyer on equal terms. The cost of meats to the consumer is higher than ever before in the history of the country, and we consider an investigation to determine the cause should be made,'' the statement continues. On the basis of these declarations the convention delegates subscribed $56,000 as the nucleus of a $250,000 fund to finance a fight for better marketing conditions. A committee was appointed to endeavor to enlist the assistance of the government in an investigation of the profits of the packing industry, apparently for the purpose of showing that the men who grow the meat are not in it with the men who handle it.

California's Interest in the Issue.

In the great length and breadth of this issue California has only limited original interest because California is not a great range-producing State. We are in the meat situation very much as we are in the bread situation, which we tried to throw out clearly in our issue of January 22—that is, we are hungry and dependent on our neighbors bringing in something to keep us from starvation. Our pantries are full of fruit-cakes, of stuff to make wine and beer of, etc., and we have to push such things out to get money to buy bread and meat with. If that were all of it we would simply have a consumer's interest in the range products, and would be on the same side of this appeal to the government with the man who wishes to buy a soup bone on the east side of New York—or of London, so far as that goes. But really our interest is different from that because we have in California a great undeveloped meat-making capacity, and ought not to be buying meat from the middle of the continent, nor from any other part of it. Our interest in the death-struggle between the great rangers and the great packers is like that of the sportsmanlike woman who shouted, ''Go it, husband,'' and ''Go it, bear,'' as either of the contestants seem to need encouragement—to the end that the fight be fair and the victory fairly won. And we cherish this judicial sentiment because we have faith that the thorough exposition of the situation may do two things at least: it may show what producers' rights are and how far packers are making it impossible to secure them. While doing that it will uncover the whole marketing condition and show that producers must thoroughly co-operate to get their rights, and to open facilities for fair trade. It will show also what California meat-producers have to do, to fairly buy or sell a few head of this or that meat-making furniture which they may need to do. Since boyhood we have seen the handicaps which have been heavily laid on farmers, by drovers, cattle-buyers, sheep-buyers, pelt-buyers and all that class of middlemen, who can put up more games between themselves to get live stock products away from producers than the whole neighborhood of farmers can see through in the course of their natural lives. The big packers may be bad enough, and we expect the issue now being urged by the great rangers will show that, but it will not show up all the little swipes, deceptions and conspiracies which exist throughout the country and keep the small meat-makers from getting proper reward for their labors and investments. Our hope, however, is that if the great range producers do succeed in slaying the big game which crushes them, the small producers may take heart to rid the country of the many go-betweens which beset the pathway of farm meat production. We need open markets of some kind in all the larger towns to which stock can be driven and sold, and we need in the metropolis a large market to which animals can be consigned with assurance that they will not be juggled with and beaten below what they are rightly worth. Sometimes it takes a great thunder-storm to clear the sky and the air, and that is what we hope the great rangers will be able to engender with their quarter of a million of slush money. It takes sharpers to catch sharpers, and we hope the rangers will have their sharpers ground to a feather-edge.

The Human Equation.

Col. Irish has his aerial scouts out on another page of this issue reconnoitering Col. Weinstock's position, and what we get from him this week is by wireless from one of his runabout aeroplanes. It is too soon to expect heavy firing, for the big guns on both sides are not yet in positions. And yet, we get a little intimation of where the howitzers will be mounted, for one line of attack at least. Col. Irish exalts the ''human equation,'' which we take to mean: what are you going to do about it, in a free country, if the people prefer to have their own individual ways instead of the imperial way which you conceive to be best for them? We expect a battle will soon open on some such fundamental question as this, but we are not fighting it, so all we can do is to invite the reader to watch for the shells which will follow the gas-bombs, which is about all the contestants have fired so far. Our position in this war is that of benevolent, armed neutrality—we are willing to have the thing fought out on our territory for the ultimate good of the state, but we do not de-mobilize our own army. We advise every reader to catch on to these war-bulletins which the commanders issue and keep on.

Queries and Replies.

Querists must give name and address.

Growing Onions from Sets.

To the Editor: Is there a certain time to plant onion sets to keep the hard stalk from growing up through the center? I was raised in Mississippi and we always planted onion sets early in the spring. They made large onions, but never had the hard stalk that gives me so much trouble now. If you can help me on this subject I will appreciate it very much.—M. W. E., Jackson.

Probably you were growing at the South the ''potato'' onion, which is popular in that part of the country. It is better to grow from sets than are the kinds chiefly grown in California which come better from the seed. The ''potato'' and the ''tree'' onion make ''top sets'' on the stem instead of seed, and these top sets planted out do not shoot a seed stem such as you object to. You can grow very useful onions from ''bottom sets,'' which are seedlings allowed to go dry, and have their growth thus stopped, but you must use them sooner—that is you must pull them before they shoot the seed stems. California has such a fine climate for onions from the seed that sets are very little used. Onions are hardy and the way to get early onions is to plant seed in the fall, not in the spring.

Cats Scratch Fruit Trees.

To the Editor: What should be done with fruit trees next to the house where the cats have scratched them and the sap runs out,—C. E. K., Sacramento.

Scrub off the gum, which is probably now soft from the rains, with an ordinary scrubbing brush, and let it dry. Then cover the wounded parts completely with Bordeaux paste (or common whitewash will do) and surround with wire net or slats so the cats cannot get to the bark; also put up a rough scratching-post for the cats.

Tile-Draining in California.

To the Editor: Has tile-draining proved beneficial under conditions of California climate? I am sure a discussion of the use of tile in California, especially in connection with adobe soils, would be helpful to your many readers.—O. L. T., Santa Rosa.

There is little need to discuss tile drainage theoretically. That chapter was practically finished a generation ago. Any soil which does not rid itself of surplus water readily should be under-drained—providing the crop justifies the expense. Not only that, but land now useless can often be given high productive value by drainage. It is usually heavy land that needs drainage because light land usually drains itself, unless it lies too low. In that ease, deep outlet should be provided for it to do so through drains. The kind of discussion which would be helpful would be the recital of experience of what tile drainage has cost and of what advantage it has been in the experience of our readers. We shall be glad to have accounts along that line.

Pigs and Piemelons.

To the Editor: Do pie-melons affect the litters of pigs of a sow when that is the chief feed; if so, which way does it affect them?—E. W. V., Visalia.

Piemelons have no poisonous effects. Pigs kept chiefly on them might be expected to encounter any trouble which might be induced by starvation. A piemelon sow could not produce milk to make strong pigs because the feed lacks nourishing contents. Piemelons can be used to advantage in connection with grain, alfalfa hay and other good feeds, but not chiefly nor alone.

Inter-Planting Walnuts.

To the Editor: Will you give opinion on the setting of walnut trees in an orchard of twelve-year-old peach trees, removing only such trees as are necessary to place the walnuts at a distance of sixty by fifty-four feet? The peach trees stand twenty by eighteen feet. Later as walnuts come to bearing I would remove the remaining peach trees.—D. E. C., Wasco, Cal.

Walnuts are likely to have rather a hard time breaking into such an old, close-set peach orchard with only such a footing as you propose. You will probably have to use extra water and manure to push them and cut back the near peaches to give them light. We would rather remove alternate short-distance rows of peaches and plant the walnuts at 40 feet so as to square up with alternate rows of the remaining peaches. This would leave the walnuts at 40 feet when the other peaches come out. In this way you can rip up the center of the land under the displaced row deeply and get out as many old roots as possible and this would give the walnuts a better chance. But before doing this we should want pretty good evidence by observation of old trees, that walnuts are thrifty and profitable in your section.

Straight Tips on Spring Spraying.

[Written for Pacific Rural Press by H. P. Stabler, Hort. Commissioner, Sutter County.]

In the Rural Press for January 22nd you have published spraying directions with the recommendation of Rex at one to eight. This is the strength for fall work. The company suggests a dilution of one to eleven for spring .

I send you an account of spring spraying I have just prepared for circulation among Sutter county fruit growers, and before publishing it I worte the various spray manufacturers and have incorporated their directions for dilution for late spraying. The copy was submitted to Prof. Ralph E. Smith before it was printed and has his approval.

Peach Blight and Shot-hole.—Two sprayings are necessary for the control of peach blight and shot-hole fungus in peach, almond and apricot trees. The first application should be made in the fall before December 15th, while the second spraying should be done just before the trees bloom. If for any reason the first treatment was omitted the spring spraying should be done without fail, as it is the more important of the two. Twig borers, curl leaf and pernicious scale (also called San Jose scale) will be controlled by the spring application.

Why Lime-Sulphur?—The lime-sulphur spray is recommended for this work as it is an insecticide as well as a fungicide. It is not advisable to use Bordeaux mixture as it would not be effective against twig borers and scale, although it is a strong fungicide. Home-made lime-sulphur is now almost entirely superseded by the commercial article. However, growers who desire to make the solution can obtain the most approved formula by addressing the County Horticultural Commissioner.

Commercial lime-sulphur sprays have given satisfaction in the past. Of the many reliable brands on the market the best known here are "Rex," "Ortho" and "Orchard Brand." For spring spraying the manufacturers of these brands recommend their dilution as follows: "Rex," one gallon of the material to eleven gallons of water; "Ortho," one gallon to eleven gallons of water, and "Orchard Brand," one gallon to ten gallons of water. The barrels should be agitated before the liquid is drawn off and kept tightly closed when not in use. When applying, the mixture should be kept constantly stirred. These sprays are to be used only when the trees are dormant.

Why a Power Outfit?—A power outfit is necessary for the best results as it is important that the liquid be forced into the rough places on the bark under a pressure of 150 to 200 pounds. The nozzle should be held close to the limbs in order that the full driving force of the spray may be realized. This is especially important when it is sought to control twig borers. These small grubs bore into the ends of tender shoots causing them to wilt and die; often the damage is very serious and when not killed outright the young trees are left misshapen and injured. Later they find their way into the fruit, causing the wormy peaches and almonds.

How to Get the Peach Worm.—During the winter the larva or grub of the twig borer remains just under the bark in the crotches of the limbs and can be discovered by the frass or saw dust that is pushed out of the burrow. For about two weeks the larvae is busy in its efforts to quit its winter quarters and finally emerges about the time the young leaves appear when it bores into and destroys the shoots. Last year this troublesome pest did great damage to peach and almond trees and with conditions favorable for its development may appear again this season. The late spraying is timed to control this pest. It is equally important at this time to thoroughly coat all of the small limbs and branches for control of peach blight and curl leaf.

While late treatment is advised, growers must be governed by the weather conditions, size of orchard, capacity of the pump and efficiency of the equipment. If possible the work should be completed just as the trees are beginning to bloom.

Peach Blight and Apricot Shot-hole.—Peach blight, a fungus disease of the peach and almond, causes a gummy substance to appear on the branches and in cases of severe infection, orchards have the appearance of having been burned over. Later the leaves drop and the crop is injured. The spotted and gummy peaches and almonds so noticeable last year were infected with peach blight.

Shot-hole of the apricot, also a fungus disease, is found on the leaves, perforating them and causing the rough brown spots on the fruit, often rendering it unsalable. Its similarity to peach blight makes the same treatment necessary. These two fungus diseases are usually more prevalent in seasons of excessive and late rains. Their wide distribution last year and the heavy rainfall this season makes it probable that they will reappear. Prevention is possible by thoroughly spraying, at the right time, but they cannot be checked after they have become established on the tree.

Curl Leaf Spraying.—The curl leaf fungus causes the leaves of some varieties of peach trees, noticeably the Phillips cling, to curl and drop, weakening and injuring the tree. It is easily controlled, but the spraying must be directed against the smaller branches and fine brush, which must be well coated with the liquid.

San Jose Scale.—Pernicious scale (also called San Jose scale) is again to be found in many orchards and if not combatted, very soon kills deciduous fruit trees. Lime-sulphur will practically eradicate this scale; the trunk and main branches require the spray.

Lime-sulphur sprays are not recommended for brown apricot scale occurring on cherry, prune, apricot, plum and occasionally on peach trees; however, all deciduous trees are benefited by a thorough application of lime-sulphur while the trees are dormant.

What to Do if It Rains.—The occurrence of an unusual amount of rain after the blossoming period may make a third spraying necessary for

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QUALITY, SERVICE.

We Have a Large Assortment of

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRICOTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote you prices.

GEO. E. JOHNSON, RIPON, CAL.

peach blight. This condition existed last year. In this event, after the fruit is well set, Prof. Ralph E. Smith recommends the Bordeaux mixture composed of three pounds of quick lime, two pounds of bluestone and fifty gallons of water.

Spraying followed by rains within 24 hours should be repeated. The attention of almond growers is particularly called to the importance of spraying this season with lime-sulphur. Peach blight and twig borers caused severe damage to the trees and crop last year and a repetition of these troubles would cause the loss of thousands of dollars. Even if it was not possible to give the trees the fall treatment the orchard will be greatly benefited by a thorough spraying with lime-sulphur just before the trees bloom.

Nut Trees on Public Highways.

[Written for Pacific Rural Press by C. B. Lewis, Brusselville, Oregon.]

People in this country, living as we do under different surroundings and environments than do the Europeans, act differently and live differently, and generally in a way that we find most suitable.

The common people of Europe live not always as they would like to, but as they have to in a great many cases. We have more room, more freedom and enjoy more liberties than they ever have any thought of enjoying.

Here is the idea I wish to emphasize: Why not practice thrift right now and not wait till we are compelled to. Not an inch of ground is wasted in the nations of Western Europe; every available means is used to get the maximum returns per acre. They believe in natural beauty as much as we do, and they park their highways with shade trees, and every city has its park or city garden which they are very proud of. In the nut-bearing regions, they take advantage of this and plant nut trees of different sorts, and besides the shade a bounteous crop is produced every year. Reaping these harvests is one way they have in helping the poor, giving them nuts or food for their labor.

They have not much space to be given up to roads and highways, and even though the roads may be narrow, they are always kept in good condition. The nut trees, mostly walnuts, are planted about sixty to seventy-five feet apart alternately on each side of the road. This is a wonderful sight to behold and a profitable luxury as well.

Some one may say, "How can we protect those trees from harm and from thieves who steal nuts?" How do we keep anything from being stolen? If the laws are properly enforced, no one need have any fear from such cause.

Since this country is becoming deforested quite rapidly, we should take it upon ourselves to replenish the plantings as much as possible. Trees when grown to some size serve as windbreaks and it is thought affect the general weather conditions in a more or less degree, helping to keep a more even temperature.

I would like to have every homemaker consider this seriously and look about in your own locality and see what can be done. Couldn't you start the ball rolling by planting some, along one side or around the entire place? Think about it.

48TH FRUIT GROWERS' CONVENTION.

The next fruit growers' convention, the forty-eighth of an ancient and honorable series, will be held in connection with the National Orange Show, at San Bernardino on February 18 and 19. The following program shows how rich in practical interest is the offering:

Friday, Feb. 19, 9:30 a. m.—Opening exercises; Citrus Culture in Butte County, F. Mason; in Sacramento County, W. W. Hinsey; in Tulare County, Hobart Webster; Certain Phases of Pomelo Culture, A. D. Shamel, U. S. D. A.

Friday, 1:30 p. m.—Value of a Good Brand, C. C. Chapman; Valencia Orange, Byron Clarke; Citrus Culture in Mexico, Prof. D. L. Crawford, Pomona College; Why Citrus Growers Should Organize Clubs, V. V. LeRoy.

Friday, 7:30 p. m.: Scale Control of Citrus Trees, Prof. H. J. Quayle; Insects Injurious to the Citrus Tree, Prof. E. O. Essig; Bird Friends and Mammal Pests of the Citrus Grower, H. C. Bryant, State Fish and Game Commission.

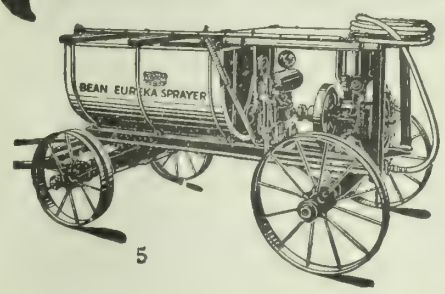
Saturday, 9:30 a. m.—Lessons from the Past Year's Experience, C. C. Teague, Limoneira Company; Renewing of Old Trees, J. D. Culbertson; Discussion led by A. D. Shamel; Pruning Young Lemon Trees, W. H. Fleet; Discussion led by Mr. S. B. Hampton; Sources of Unnecessary Decay, R. L. Willits; Discussion led by G. W. Hosford.

Saturday, 1:30 p. m.—Formation of Nitrates in the Soil, Dr. W. P. Kelley, Citrus Experiment Station; Movement of Nitrates in the Soil, I. G. McBeth; Our Present Knowledge of Citrus Fertilization, Dr. H. J. Webber, Citrus Experiment Station.

Saturday, 7:30 p. m.—The Eight to One Test for Oranges, (speakers to be announced); Problems in Citrus Culture, G. Harold Powell, California Fruit Growers' Exchange; Rural Credit Systems, Marketing, Colonel Harris Weinstock, State Commission Market.

Apple Growers.—Special program for Apple Growers' meeting to be held at San Bernardino, February 19, 1916: 9:30 a. m., Pruning the Apple, J. B. Hundley; Spraying the Codling Moth, Geo. P. Weldon, Sacramento; Varieties of Apples for Southern California, Isaac Ford and K. R. Smoot. 1:30 p. m., Cultivation and Cover Crop, W. M. Mertz, Citrus Experiment Station; Packing and Marketing the Apple Crop, F. S. Jerome, Watsonville Apple Distributors.

Following is the February schedule for Glenn county farm bureau meetings: Feb. 7 and 8, Codora Farm Center, night meeting Tues., Feb. 8; February 9, Jacinto Farm Center, night meeting Wed., Feb. 9; February 10, night meeting at Orland Farm Center; February 10 and 11, Larkin Farm Center, night meeting Fri., Feb. 11. The monthly meeting of the Board of Directors will be held at the office of the Farm Adviser, at 10 a. m. on Saturday, February 5.



One-Man Power Sprayer

A Complete High-Grade Outfit at Small Cost

Here's the rig thousands of small farmers, orchardists and vineyardists have been looking for—a dependable, reliable, efficient, high-pressure power sprayer at small cost. One man does all the spraying. One horse can haul it anywhere. Supplies one line of hose and will cover from 2 to 3 acres a day. This is the first time you have been offered Bean quality in a low-priced outfit. Note these features of the

BEAN EUREKA

LIGHT WEIGHT—Makes it an easy pull for one horse and a mighty handy sprayer for rough and hilly land.
INEXPENSIVE TO OPERATE—One man does it all. Low first cost and practically no cost of upkeep.
NOVO ENGINE—as sturdy a sprayer engine as you can find. Novo spells satisfaction.
ALL COMPLETE—Including Patented Pressure Regulator, Rotary Agitator, Truck, Canvas Cover and Curtains, Hose, Rod, and everything complete.
THIRTY YEARS OF EXPERIENCE are back of the Bean Eureka—and experience counts.

Send for NEW Catalog

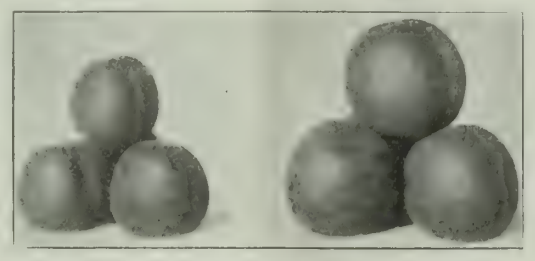
Demonstrating Ammonium Sulphate Uses

[Written for Pacific Rural Press by William B. Parker, Farm Adviser of Ventura County.]

Ammonium sulphate is an efficient fertilizer and soil rectifier for certain conditions, as was shown by a demonstration plot on Mr. Allen Fraser's foothill orchard near Ventura. The Farm Adviser was requested to investigate the stunted condition of the apricot trees in one section of this orchard, and found that the twigs were stubby, that the leaves were reported to have been pale and the fruit small in size and amount.

An examination of the soil showed that the drainage was good, that there was no underlying plow sole, hard pan or gravel bed, and that the texture of the soil was extremely good. Since the recent investigations of the Division of Soil Chemistry and Bacteriology as reported in Bulletin No. 260 of the College of Agriculture and Agricultural Experiment Stations has shown that the form of nitrogen used in a fertilizer influences the rate and amount of nitrates that a soil can produce therefrom, it was decided on consultation with Prof. Lipman to work on the following basis. Large quantities of farm manure had been applied to the soil with no results. Therefore the trees were probably not obtaining enough available nitrogen because neither the manure nor soil nitrogen could become available readily enough. Sulphate of ammonium nitrogen has been shown to be highly available, in the experiments above noted on similar soil types. Taking these observations together, it was decided to use sulphate of ammonia in an attempt to improve the condition of Mr. Fraser's trees. This was done with the following results:

1. When the leaves came out they were a dark green in color.



2. The new growth was very vigorous. In June the contrast between the four treated trees and the untreated trees was so marked that one could distinguish them as far as they could be seen.

3. The weight of ten average fruits from the treated trees was found to be one pound, five and a quarter ounces, or 15,097 fruits per ton. The weight of ten average fruits from the untreated trees was eleven ounces, or 29,090 fruits per ton. The difference between the ten fruits from the treated trees and the ten fruits from the untreated trees was 10½ ounces, which corresponds to 13,993 fruits per ton.

By comparing the weights of the pits of the fruits from the treated trees with those on the checked trees, it was found that while the treatment has resulted in an increase in the weight of the fruits, the per cent of pits had been decreased, the former having 7 per cent pits, while the latter had 7.9 per cent.

Stubby growth, yellow condition of the foliage and small fruit is not in all cases due to the condition above described, and before applying any amount of ammonium of sulphate to an orchard the grower should consult with the farm adviser, if there is one, or with the College of Agriculture of the University of California.

One of the best ways to determine the value of ammonium sulphate on a soil is to spread 3-5 pounds upon the feeding area of each of a half dozen trees. Let the trees do the deciding, as they did in Ventura county.

Result of a demonstration of the use of ammonium sulphate on certain soils in Ventura county. Left, average from an untreated plot; Right, average fruit from treated plot.

TEPARYS NOT SMALL WHITES.

To the Editor: I noted an article about Tepary beans in your last issue, and as I tried some on my place last year, and had fair success, I would like to ask if they are going to be a bean readily marketed?

Are they sold as "small whites"? I have never seen them quoted in the market list of "Beans." Are they bought by seed houses? I have none to sell this year but would plant several acres next year if there is a sure market. They made an average of nine sacks per acre on the small piece I seeded to them last year, which is better than hay. We had some very hot weather, but the Teparys stood it fine.—Geo. N. Bell. Napa.

[Nobody knows what the future market for these beans will be. They are not sold as "small whites," but rather under their own name, what few are handled. At this time they are being sold for one cent a pound less than "small whites" in this market.—Eds.]

BLACKEYES IN CORN.

[Written for Pacific Rural Press.]

"We planted blackeye peas and non-saccharine sorghums together at the same time," says J. E. Hawley of Madera county. "Then we irrigated just when the corn began to joint and again when the head was pushing, if necessary. We cut the corn heads off and put the grain in our granary for future use and the pigs were turned in on the blackeyed peas to harvest them. A movable panel fence was used, to give them a small field at a time. Any one who has not tried it would be surprised to see how long a piece would last a bunch of hogs and how well they look after they have been working for their board a month."

The latest figures from the Department of Agriculture show that on January 1, there were 1,550,000 beef cattle in California as compared to 1,480,000 a year ago and 1,546,000 five years ago. The value per head is given as $36,30 as compared with $39.30 a year ago and $23.50 five years ago.

Protest Against Exaggerated Olive Yields

To the Editor: We have before us a clipping from a newspaper published in this State, wherein a letter is printed from a local olive "expert" to a city dweller on the subject of olives and their crops. It says, "We have in this section trees which are from six to eight years old, yielding six to eight tons of fruit per acre, with the majority fine fruit." It goes on to say that the district mentioned is the best known olive section in the world, etc., etc.

It should be proper for any citizen who is at all posted on olives and their crops to deny such an exaggerated and misleading statement. It seems especially proper for this association of olive growers to protest against the writing or publication of such mis-statements, on the ground that they not only injure the industry, but they injure the reputation of the whole State, and especially are apt to mislead and harm the innocent individual who reads and credits as a fact these impossible figures of crop returns.

An olive tree well cared for and in good soil and under proper climatic conditions may yield a half ton to the acre, the fifth season after planting. The seventh crop may be a ton to the acre. These figures are based on known results and upon the present planting per acre of young trees. They will vary, however, but there never was nor will be in California or elsewhere, a grove that yielded a crop even approaching that quoted above. Almost a record yield for planting on a large scale is reported by a company who employ the most efficient brains, combined with scientific methods. They report 2½ tons per acre for 6 year old trees, a wonderful yield, yet they plant twice the usual number of trees to the acre, with the intent of cutting out one-half when they are ten years old.

The olive industry is a fine one for the city man to embark into if he has money, brains and patience. It is no royal road to fortune and the trees require work, will and water, to quote Prof. Wickson and his "Three W's." "No one county is the best either and many are equally good." All these things, and many more may be accurately determined by any one interested, from the proper State authorities; but let us frown down such idle statements as the "olive expert" has lately and modestly made of his excellent community. It is no longer the fashion to say such things.

R. L. Underhill,
Secretary California Ripe Olive Association.

YELLOW FOXTAIL ON OVERFLOWED LANDS.

To the Editor: I have some low overflow land that I irrigate for summer pasture and the last year I have noticed a grass that commences with a flat, reddish stalk. Its tendency is to lie on the ground till the seed stalks come out when the growth is more upright. These stalks are round and grow about two feet high. The seed grows in a tassel that greatly resembles the top of a corn stalk, but much smaller, being only about three inches in length and breadth. The seed shells very easily and the plant spreads very rapidly.

It grows in water, but is much more leafy if only irrigated. It never comes up till after the danger of flood has gone and the ground warms, grows all summer till frost, which kills it. Has this plant any food value and if I allow it to spread, will I develop an asset or a liability?—W. W. M., Dixon.

[Answered by Professor H. M. Hall, University of California.]

The grass is Yellow Foxtail (Setaria glauca). This very troublesome weed of the Mediterranean region, and well-known in the eastern States, is becoming much too common in California, where it is a serious menace to alfalfa fields, especially where for any reason the alfalfa is not in a thriving condition. It is very desirable therefore that the plant be exterminated wherever it appears. Since it is an annual this would seem to be merely a matter of preventing it from setting seed; but the seeds are produced in such abundance that the eradication of the plant is often a very difficult matter. Since I have no first-hand knowledge on the subject, I quote as follows from Professor Pammel's Weed Flora of Iowa (Iowa Geological Survey Bulletin No. 4):

Extermination.—It is not generally recognized, but it is probably true, that more money is spent in the extermination of foxtail than of any other class of weeds we have in the State of Iowa, yet they are all easily destroyed. One of the best and most effective methods of destroying the foxtail is by plowing the small grain field as soon as the grain is removed. If this is not done a large amount of seed is produced. After this plowing the small grain field should be disked and harrowed in the spring and then planted at least four or five times. This method should prove effective for the destruction of foxtail and pigeon grass.

The plant here discussed should not be confused with the various species of Barley-grass (Hordeum murinum, etc.), which are commonly called Foxtail in California. The true Foxtail differs from the Barley-grass in its much more slender habit and narrower, cylindrical flower-clusters.]

A thorough canvass will be made and meetings held in practically every raisin-growing district in the State during the coming month in an effort to secure new members for the California Associated Raisin Company.

There Before the Horses

The Yuba Ball Tread Tractor gets on the ground before horses because—with its large tread area the Yuba stays on top, where the horses mire.

REX
KING OF SPRAY MATERIALS

"There is a REX for Every Orchard Trouble"

For Spring Spraying
Rex Lime and Sulphur Solution and
Rex Arsenate of Lead

---will crown the orchardist's efforts with success

REX LIME AND SULPHUR SOLUTION is the **original** commercial brand of Lime and Sulphur Solution, and for 20 years has stood pre-eminent as **the most efficient all-around control for orchard troubles.** There is no other commercial brand processed by methods of equal chemical exactness—therefore no other brand can give the orchardist such uniformly successful results. The truth of this statement is reflected in the universal endorsement of this product by orchardists, State Experiment Stations and authorities on spraying generally.

REX ARSENATE OF LEAD being of the finest precipitation and possessed of the maximum amount of Arsenic in its most available and efficient form, has the maximum killing capacity, covering capacity and sticks where it is placed. The latter feature is of immense value in labor-saving as the longer the material stays on the trees the less often it will have to be applied.

Col. Irish Rises for the 'Human Equation.'

[A Reply to Col. Weinstock's letter in our last issue.]

To the Editor: We began a discussion of official branding, routing, storing and borrowing money on farm products, all to be a government function, administered by a political commission, part of a political machine.

I had already written Col. Weinstock's office a letter intended to turn his attention from bottle feeding the producer, to the consumer's part in the exchange of farm products. I thought to impress him with the fact that the producer cannot reform the habits of the consumer, and that those habits have caused the failure of all large attempts, in our large cities, to bring producer and consumer together in a public market. The phone is too handy and the distinction of having the goods delivered is too highly valued.

Now, if Col. Weinstock insist upon using what I have said about the consumer as an argument in favor of paternalism, by which the State will take the most important part of the producer's business out of his hands, and every year make him more ignorant and less independent and effective than he is now, so be it.

He may brand the farmer's products with the state seal until it stands out on every sack and box as plainly as the stigmata on the palms of Christ; he may route, store and borrow money on the goods, and what will it all have to do with pulling the consumer away from the telephone, or stopping the retailer from paying and charging a price that will pay him the cost of delivery and interest on the investment in his delivery plant?

Now, pausing long enough to beg of Colonel Weinstock to omit personalities, complimentary or otherwise, and to remind him that his opinion of my mentality has nothing to do with the case, permit me to repeat the statement that the farmers of this State have shown themselves entirely capable of co-operation and routing and selling many of our more important products.

To this Col. Weinstock opposes the statement that only 62 per cent of the citrus growers are in co-operation and their wisdom is often overcome by the foolishness of the 38 per cent of independents.

Granted; but when Col. Weinstock, for the State, becomes the 62 per cent, and handles the State's branding iron and stencil, routes, stores and borrows money on the goods, what is he going to do with the 38 per cent of independents? The first principle of paternalism is that a law can do everything. Does Papa Weinstock, the citrus Santa Claus, propose to make it a crime for the 38 per cent of citrus growers to attend to their own business, and when he gets them safely in jail, add their product to his pack?

Again, opposing voluntary co-operation, Col. Weinstock finds "the human equation" in the way, with "rivalries, jealousies and lack of human confidence."

Please show me where the human equation is not. It is as much in the dry goods business, yes, and in the wet goods, and groceries, in legislation, political machines, and the churches, as amongst the producers.

Col. Weinstock seems to think that he has a mission to smite the human equation in the farmer and cancel it out, and substitute for it the Weinstock equation.

I beg to appear as attorney for the human equation. Paternalism in government is out gunning for it. But in that human equation is the quality that makes states and defends their sovereignty. Within it is that initiative which has brought 62 per cent of the citrus growers into co-operation, and, if not destroyed, it will so show forth the benefits of co-operation as to bring every outsider in. The same is true of all forms of production that can be made the object of co-operative usefulness. Old Mother Experience is still teaching school, and makes stalwarts out of men by hard knocks.

Col. Weinstock is undoubtedly benevolent. But would he want the State as an Overlord in his business? He has bad years and good; years when he could weep into one of his stock handkerchiefs, and fit it for a fire sale.

Does he in such melancholy moments "think it about time, for the welfare of the State, that the State took a hand in the situation," of the dry goods trade?

He is highly cultivated. His head is well stored with knowledge. Is there room in it for one more idea? If so it is this: let him admit to the bright company in his brain, the knowledge that the farmer is a business man like himself, and just as wise in his business as he, just as capable of managing it, and just as trustful of the human equation.

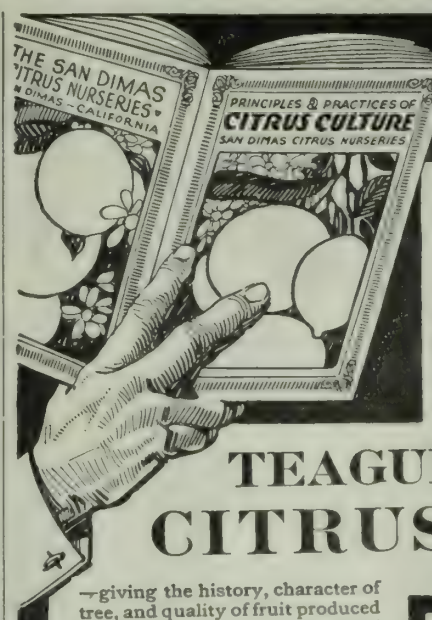
The farmer does not care to be treated as a mendicant, a weakling and a dependent.

The theory that the State should protect the unwise against his folly, the unskillful against his inapiness, and to do this take from all men of a class, or common occupation, their independent control of their affairs, may for a time produce larger profits, but in the long run it will produce smaller men, for the more the State does for the people the less they will do for themselves.

Jno. P. Irish.

RAISING A BIG CROP OF BEANS.

[Written for Pacific Rural Press.]



An average of $78.90 per acre from 20 acres of Blackeye beans, while unusual, is what Dr. Cross of Manteca, San Joaquin county, secured last year.

The yield on this land was 28½ sacks of 80 pounds each per acre and the price received was $3.50 a hundred.

The land was a sandy loam and was well plowed and harrowed early in the spring. Planting was done with a planter May 26, the rows being 32 inches apart and the seed dropped every three or four inches. The field was hoed once to kill the big weeds in the rows and cultivated three times during the summer. The beans were harvested the last of October, the vines being cut beneath the surface with knives attached to a sled. They were then put into small cocks and allowed to cure for two weeks, after which they were rolled with a large roller.

Dr. Cross thinks it important to let them stay in the cock to avoid an excess of green beans and prefers rolling to thrashing as he gets less cracked beans in this way. Later they are run through a fan mill for cleaning.

Besides the yield of beans the straw is valuable, either as a cattle feed or for fertilizer. When stockmen will not pay a sufficient price Dr. Cross spreads the straw over the field and plows it under for fertilization purposes.

have you this Book?

—if not, it will be our pleasure to mail you a free copy, *provided*, you will write us the number of Citrus trees and varieties you will require. Besides giving exact information on orange and lemon growing from seed to harvest, from packing house to market, it also describes

TEAGUE QUALITY CITRUS TREES

—giving the history, character of tree, and quality of fruit produced by the standard and ornamental varieties mentioned in the opposite panel. The book is sumptuously illustrated, thus affording a splendid object lesson of California's great citrus industry.

—for the past twenty-six years we have made the growing of citrus trees and the development and management of orange groves an exclusive business. This of itself insures quality in our nursery trees that no one contemplating planting an orchard can afford to neglect, particularly when we are offering stock at prices that are the lowest for the best trees that can be produced. Write us to-day.

San Dimas Citrus Nurseries
SAN DIMAS, CALIFORNIA.

-hardy citrus trees

Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grapefruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees — get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

Peaches Perhaps Too Thrifty.

To the Editor: A peach orchard (clings and freestones) of 20 acres stands in soil composed of fine silt and river-washed pebbles, upon a terrace or bench bordering the San Joaquin river. This deposit is about 12 feet deep and is underlaid by a stratum of chalky, old, volcanic ash, containing some fine pumice stone. This stratum, where it is exposed on the immediate river bank, is from 12 to 18 inches thick, and about the level of winter high-water mark. Beneath this occurs other more or less porous river deposits. Water in the house well, on orchard level, stands at about 20 feet from surface.

This orchard, now in its eighth year, makes a vigorous growth; the soil seems to furnish abundant nutriment; but there has never been a good average crop gathered from it. The tract is level; and is generally irrigated 3 or 4 times a season. Water is in sufficient supply for good wetting.

Why does the crop fall short? Because of too high living, or too deep soil—affording rapid drainage—or improper pruning? It has been suggested by one peach grower that less severe winter topping, or very little at all, this winter would stimulate the setting of fruit buds for next year's crop; but I am not offering suggestions. I wish the editor to do that.

There are 20 acres of Malaga vines,—same age as peach orchard,—contiguous to orchard and in exactly the same soil. The vines are apparently thrifty and strong, and are expected to turn off 80 to 100 tons of green grapes this season.—W. L. A., Fresno.

[If your peach-growing adviser has seen the trees and the way they have been pruned he certainly has the advantage of us in making a guess and you probably cannot do better than follow his advice. We would add that one irrigation rather late in the summer ought to be enough to carry the trees through on such deep soil even if somewhat leachy. We should prune less and irrigate less and watch the trees. The soil surely seems all right by the way the peaches grow and the grapes bear.—Editor.]

MAKING GRAPE VINES BEAR.

To the Editor: In your issue of December 25 Mrs. M. L. W. of Occidental asks about Rose of Peru vines which do not bear fruit. I would say that there are many things to be considered in connection with making an old vine produce a crop. First, it is very hard to state reasons without seeing the vines. Mrs. M. L. W. states that her vines are very strong and vigorous. In that case, I would conclude that she will not succeed in producing a crop until she forces the vines to develop fruit buds. There are a few fruit buds already developed and she should know the difference between a fruit producing bud, and non-producing, and then she could begin to make her vines produce.

If Mrs. M. L. W. will plow say about April 10th (that is after the vines have made a start) about 10 to 12 in. deep, and let the ground lie without further work except to keep the weeds from covering up the vines, when the vines have made a growth of from 3 to 6 inches in length just take out the end of the shoot which has fruit buds; and if there are not any fruit shoots to amount to anything, take out from 30 to 50 per cent of the shoots, and pinch out the ends of all that remain. This will check the vigorous growth by late pruning (March 10th) and neglect of cultivation, and by forcing the new shoots to put out laterals next to the base of new growth will force the vine to develop fruit buds; also to produce a second crop of grapes this season.

It is possible to make even the Thompson Seedless and Sultana vines to develop fruit buds on all renewal spurs. I find many vineyards that are failing to produce fruit, will under the system of pruning one-year-old wood (what is termed a sucker or wood shoot), produce grapes the following year if it is forced to develop fruit buds. There is no difference where we get or leave the spurs (providing the right buds have been developed), but we must learn first the difference in buds and, next, how to produce the fruit buds where we want them.

If Mrs. M. L. W. will follow my system, within three years her vines will be producing from 10 to 15 tons per acre. Make the start this season, and improve each year until the vines are brought up to a standard.

Frank Henry.

Fresno, Route 7, Box 78.

WINTER ASPECTS OF CURL LEAF.

To the Editor: Enclosed please find blackened leaves and blackened, distorted twigs from one of my peach trees Is it a disease which must be looked after?—K., San Francisco.

[Answered by Prof. W. T. Horne, University of California.]

[The specimens are affected with curl leaf disease. The evident reason why you have not recognized this is that in this case the disease has developed to an unusual extent on the twigs, which the curl leaf causes to puff up and be soft and fleshy early in the season, but which now are dry and turned black. Also some of the leaves which normally fall off from curl leaf shoots are still attached.

The disease is not, as you suppose, a local one in the orchard, but can be expected to attack all of the trees unless suitable treatment is applied for prevention.

I do not think that pruning will be liable to help a great deal in this case, although it would be well to clip out such twigs as those which you have sent, for they cannot return to normal growth.

The treatment for curl leaf, as it is probably known to you, consists in spraying just before the buds open, with Bordeaux mixture or lime-sulphur solution. This should effectively prevent the curl leaf in all the peach-growing sections of California , although there are districts from which we hear that one treatment has not been entirely successful. Any treatment made after the blossoms open and leaves commence to appear must be with some very safe materials, on account of the tenderness of the trees, and it is probable that it will not be practicable to undertake anything more than the one spraying.]

PLANT TREES NOW!

Plenty of rain; a perfect stand of trees can easily be gotten if good nursery stock is planted early.

Kirkman Trees

are raised right and our grading will please you. Every tree the same Caliper. Still a good supply of

What Shall the Information Bureau Do?

[Written for Pacific Rural Press by Santa Clara County Correspondent.]

Great are the possibilities of the prune and apricot growers' information bureau, whose formation was authorized at the growers' meeting held in San Jose on Jan. 19. To realize these potentialities, the action of the State central committee must be wise, united, and comprehensive. The committee must build not only for the present season but for the years to come. The writer believes, in common with other growers with whom he has discussed the matter, that the glorious vision portrayed by Col. Weinstock is a thing the realization of which lies considerably in the future. How far in the future depends largely on the length of time it will take to knit a strong, pliable, well-wrought fabric from the differing, often warring, elements that make up the producing end of the California prune and apricot industry. For the initial steps in this creative process the prune and apricot growers' information bureau is well fitted.

One of the first duties of the newly apopinted State central committee, working through its executive secretary, is the cataloging and classifying of every dried fruit and apricot producer in the State. The securing of this information and the soliciting of membership in the bureau may be done at the same time. In each fruit-growing election precinct, school district, or other small unit of area or political subdivision the bureau should secure the services of an honest, competent and efficient assistant whose duty it would be to interview every grower in his district. From each grower he should ascertain his bearing and non-bearing acreage; his last year's production; whether he will need to borrow money to make his crop; if he does require money, how much and when. An earnest attempt should be made to secure each grower as a member in the bureau by having him pay his assessment in full. If payment in full is impossible the grower should contribute what he is able to with the understanding that he is to have no active hand in the selection of the State central committee men and in the conduct of the other activities of the bureau. He would, however, later be entitled to receive such market and crop information as the bureau might collect. This individual promotion work might well be supplemented by growers' meetings in the different sections at which the purposes of the bureau could be explained and endorsements of its work be secured. Through proper organization the desired field information would be obtained in a comparatively short time, as would also a good membership in the bureau. While the field work was going on the central office of the bureau would also be getting in touch with sources of market information, both foreign and domestic, and so far as possible with those who might later supply foreign crop information.

With a membership that would probably comprise at least 60 per cent of the prune and apricot growers of the State, and with a list of all the other growers at its disposal, it would be comparatively easy for the bureau to hold a plebiscite, or election, on any question of policy affecting the industry. For example, the questions concerning Col. Weinstock's revolutionary ideas could be thoroughly discussed in Grange, Farmers' Union, Improvement Club or wherever growers congregate in California, and after a widespread educational campign of this or similar nature has been conducted and completed the question of so organizing as to put into practice the marketing ideas of the State Market Commission Director could easily be placed before the grower and a decisive answer made. For the present the opinion of those who may best be listened to is, that so far as the prune and apricot growers are concerned, it is advisable to market this year in the old way. Let the ideas of Col. Weinstock meet the tests of time and thorough consideration and, if deemed advisable, let the 1917 crop and those of a series of subsequent years be held mainly here in California and supplied to the markets only as needed, and then in a scientific manner.

Summing up, the writer believes it desirable to see the organization of the information bureau perfected. Prune and apricot growers will then have at their command a machine that is capable of expressing their will and desires, concerning any political or economic question pertaining to the industry.

RICE HULLS DANGEROUS.

To the Editor: In your issue of June 29, you refer to the "By-Products of Rice for Stock Feed." I do not think you made it strong enough regarding the harmful effects of feeding rice hulls. These hulls splinter and these splinters get into the gums and roofs of the mouth and cause a very serious congestion, making eating almost impossible. I have had experience on this subject in the Texas rice fields and no one ever attempted to sell them as feed there.

Rice bran is good, if sweet and fresh, but is hard to get at a price worth while as the rice polish is much more nutritious and at double the price of bran is considered the cheaper.

Rice polish is a splendid summer feed for sows and young pigs as it is not at all heating, though strengthening and fattening. It should be fed as a slop in conjunction with other feeds.—G. Frank Rossire, Porterville.

[We understand that the rice mills in California are taking pains to see that none of the hulls are mixed with the rice bran or polish as it is largely through such practice that rice by-products have come into bad repute in the southern rice-growing states. The only use that California rice mills are advocating for hulls, is in packing goods for distant shipping, as they are said to be practically fire proof.—Editors.]

J. H. Courtney of Modesto, the local representative of the California Peach Growers, reports that the peach growers of Stanislaus county are backing up the Association splendidly and it is his opinion that the greater part of the crop will be handled by them.

TREES

Order Now

It makes no difference to us whether you contemplate planting a large commercial orchard or your home grounds. With our complete assortment of stock grown under the most favorable conditions, we are prepared to give the very best of attention to all those who favor us with their orders.

The splendid rains have made conditions ideal for planting and this looks like an enormous year. Better send us your order now to make sure of getting what you want to plant.

Walnuts

California is the only state in the Union in which walnut culture has been carried on on a commercial scale. Now that French types of walnuts have been introduced, many localities in which walnut culture did not seem to give any promise a few years ago are becoming walnut centers.

For years we have been walnut headquarters. Our magnificent stock of Franquette in the Vrooman strain, together with such varieties as Mayette, Eureka, Placentia Perfection, etc., offers the planter an opportunity to secure the finest trees at reasonable prices. We advise planting grafted trees only, and will make special inducements to commercial planters. Write us for quotations.

As nearly everyone knows, the Calimyrna Fig is the celebrated fig of commerce introduced and grown by us successfully. It leads all others for shipping, table and drying purposes. The demand is exceeding our most sanguine expectations.

We can also supply White Adriatic, Mission and other leading varieties. Write us for quotations and suggestions.

We have specialized on ornamentals for a great many years. Our stock is adapted to California conditions and is more diversified than that of others.

Our landscape department will gladly assist you in the laying out of your grounds and the selection of varieties.

Write for Catalog—FREE.

If you have not already received a copy of our 1916 catalog we will gladly send you a copy free. It is complete in every detail—listing and pricing over 2000 varieties of fruit and ornamental trees, vines, plants and roses. When writing, state what you have in mind to plant, or about what your requirements will be, and we will gladly advise with you free of charge.

Box 18 Fresno, California

FRUIT GROWING IN IMPERIAL VALLEY.

(Continued from page 153.)

Winter Bartletts. — The 20-acre winter Bartlett orchard in the southern part of the county has proved a big money-maker; and many young orchards have been started from its wood, including 40 acres not yet in bearing, planted by the owner of the old 20 acres. But consideration is needed of the facts that the fruit as grown at present does not keep commercially much into the new year; it is rough and unattractive in appearance, is oversize for marketing, often ripens and rots on one side before the other is soft enough to eat, is stringy and coarse. With all that, however, it has a delightful flavor and juiciness, and is the only late deciduous fruit in that Valley.

Early Fruits Need "Soft" Soil.— For early fruits and dates, only the "soft," well-drained, early-warming, sandy soil of the Valley is suitable. W. E. Packard of the University Experiment Station at Meloland estimates about 25,000 of the acres now under irrigation as suitable for fruit.

Any deciduous fruit except figs that does not come early enough to beat that from the northern districts to market is acknowledged to be destined to failure. The hope of Imperial Valley fruit lies in its superior sweetness and earliness. The "hard" lands do not produce such fruit, though in many places the trees are doing finely.

Fruits Discarded.—Among deciduous fruits early tried out and discarded are cherries, peaches, plums, prunes, apples, pears, grapes for raisins, nuts, and most small fruits. Many of these, according to Horticultural Commissioner F. W. Waite, have leaves which are too porous to endure the summer heat. Certain it is that the trees have not lived long, did not develop fruit buds successfully in the hot, excessive dry atmosphere, and the fruits in most cases have been fibrous and lacked flavor. A few Muscat and Thompson grapes are made into raisins by watching carefully to roll or stack the trays before the fruit is dried too hard, but even these have failed to arouse enthusiasm.

Commercial Deciduous Fruits.— Deciduous fruits generally recognized as adapted to the soft lands of the Valley are apricots if rightly cared for, figs, and most important, table grapes.

Newcastle, Blenheim and Royal are the varieties grown, the latter two being a little later in ripening and a little larger. Such, which do not get onto the market early enough, are dried in a small way for local use. Practically all of the many apricot orchards scattered about the valley show weazened, dried-up fruit buds and discouraged new wood. At least two orchards, however, have plenty of new growth and plump buds. This is due to better care and more thorough watering, according to the successful ones, who prove the adaptability of the apricot to the valley.

Figs are almost omnipresent, mostly as roadside or home orchard trees, though the many trees of all varieties that have long been bearing prove the fig to be especially adapted. The wasps necessary to pollenize the Smyrna variety are more prolific and mature sooner in this dry, hot climate, so that as many as seven generations a year are available for all crops of the Smyrnas.

Early table grapes seem the fruit most universally cultivated in considerable areas, being grown principally for shipment to Eastern markets. They color and sugar better and are the earliest in the State. Thompson Seedless are coming to be recognized as the best commercial grape, though the ordinary Spanish Malaga occupies more acres now. The Government maintains an Experiment Station with 215 varieties of grapes near Brawley, and from this there are about to be introduced a few new table varieties which show more alkali resistance along with other and better points, such as color and shipping quality. Thompsons ripen earlier and unless picked at he earliest lawful stage of maturity, are likely to shatter badly in shipment. Persian varieties, though usually very shy bearers, are generally fair money makers, the berries being well colored, sugared, and large sized earlier than Thompson Seedless.

Birch MacQuiddy of Contra Costa county is one of the few who are successful in growing mushrooms for the city markets. His farm comprises a piece of ground 20 by 65 feet in dimensions and the proposition looks so good to him that he will enlarge it this year.

Heavy shipments of potatoes have been made the past two weeks to southern California from Stockton.

John Deere Plows for Light Tractors

For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.

Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.

John Deere Disc Plows for Tractors

For Field or Orchard

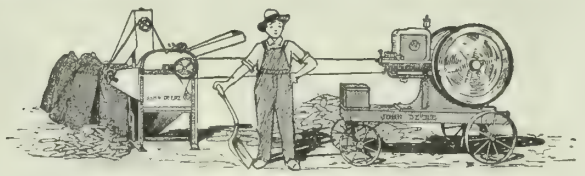
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



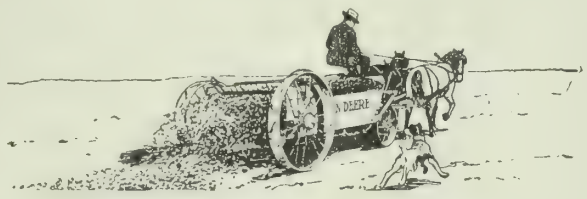
Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.



R. & V. Engines

Dependable Farm Power

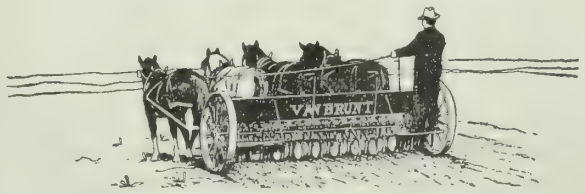
"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8,10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Spreader

The Spreader with the Beater on the Axle



ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

Van Brunt Drills

With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

John Deere, Moline, Illinois

Mechanical Power on the Farm.

[Written for Pacific Rural Press.]

EXPERIENCE WITH POWER FOR SAWING, GRINDING, ETC.

To the Editor: In reply to R. E. Smith, Bishop, as to "What Size Engine," will volunteer my experience. I use a Fairbanks-Morse No. 1 corn and cob mill, and a wood saw with a F.-M. 2 h.p. engine. This engine is ample for a sheller or grinder with flywheels if the latter is not crowded and handles the wood saw very easily, cutting apple limbs up to 8 or 9 inches without any trouble, but it is largely a matter of flywheel weight, speed and size of saw. My first outfit was without fly-wheel, and the engine could hardly pull through a 3-inch piece without pulling down. Next outfit was equipped with a 22-inch saw and a 100-pound flywheel, and with the 2 h. p. engine it will keep three men on the jump to keep it going and we have cut limbs up to 11 inches in diameter and 10 or 11 cords a day. However, use as small a saw as you can for the size of wood you wish to cut, since a small increase in diameter of saw requires a large increase in engine capacity. I use an aermotor pumping engine to run a 1900 washing machine with wringer, but think you will find that grindstone requires more power than washer, especially if you are grinding a sickle or the like. A big engine is more comfortable to work with as it makes things move faster, though of course is not economical on a light load when you compare time saved with extra gasoline used by the larger engine. Permit me to state that a cheap substitute for new steel shafting is 1-inch pipe—use hard wood bearings, and smooth bearing surface of pipe with a file. Get split wood pulleys and your outfit hasn't cost much. W. L. H.

Watsonville, Cal.

RIVER EATS DIRT.

The Santa Ynez river has eaten away about 50 acres of fine alluvial farm soil 30 to 50 feet deep on one of the ranches under direction of E. C. Tallant of Santa Barbara county. During the past 10 years $20,000 has been spent to stop the damage, but nothing has availed. A bulkhead was put in, piling driven 20 feet deep, and cables held them, but a high water aided by the quick sand of the river bed, and the drift wood, broke off the piling where they entered solid ground. The current hits one bluff and is deflected against another alluvial bluff not far below, at right angles. It is the latter that has suffered in spite of all that could be done. Now a company has, under contract, "no cure no pay," put in current deflectors along the crumbling bank—20 of them about 100 feet apart, and no damage had been done up to Jan. 7. These deflectors are V shaped, built to stick their noses into the current, deflect it, and create a comparatively still water behind them in which sediment collects and builds up the bank that was formerly eaten away.

ENGINE WITHOUT BATTERIES AND WOOD SAWING.

In a letter to this office, A. A. Denny of Palermo comments on our recent article about starting a gas engine direct from the magneto in this manner:

"I have a two horse power Stover engine which starts direct from a Hendricks magneto. The magneto is coupled by a beveled leather friction wheel, direct to the face of the engine fly wheel. Two or three strokes or turns of the crank shaft will create an explosion when the engine is not loaded or fastened to a force pump, and five to ten turns of the crank shaft will insure the engine keeping up speed enough to maintain a steady fire till it has gained speed enough, by belt connection, to saw wood.

"The engine has the make and break spark system. I have used the magneto for six years with very little ignition trouble; before that I used batteries with all kinds of trouble.

"I would also state for the benefit of your subscriber enquiring about the efficiency of a two horse power engine to saw wood that an engine of that size of good standard make can saw 12 to 18 tiers (nor cords) of hard dry oak, two to 12 inches in diameter, per day with two men. It will take small wood as fast as one can feed it to the saw, but one cannot crowd the saw with the larger pieces and the saw must be kept in the best of order, with the front of the tooth filed on an exact line of a straight-edge drawn from the front of the saw tooth to back of the nut on the mandrel.

"The reason of this is that with a slight hook in the tooth, the saw is slightly inclined to feed itself, thereby causing unnecessary friction in feeding the saw which acts as a brake and wastes power."

SIZE OF RESERVOIR FOR 50 ACRES.

To the Editor: Please advise me as to the proper size of a reservoir for irrigating 50 acres of alfalfa land. It will be fed by a four-inch centrifugal pump. What is the best method to prevent seepage?—H. H. B., Millville.

[Answered by Prof. S. H. Beckett, University Farm, Davis.]

[You state that this will be supplied by a four-inch centrifugal pump and I am assuming that the discharge will be not more than 450 gallons per minute. With this discharge, assuming that in the irrigation you cover each acre to a depth of eight inches of water, approximately 17 days' continuous operation of the plant will be necessary, in order to cover the 50 acres.

In building a reservoir, where almost continuous pumping is necessary, it is advisable that it be built of such size that it will hold from 18 to 24 hours' continuous pumping. If the reservoir is used, your pump may be allowed to run all night and a part of the day before it will have to be emptied. If the size is figured to hold 18 hours' pumping, it will have to have a holding capacity of 1½ acre feet of water. It is estimated that a desirable depth is 6 feet. It will then be necessary that the reservoir have an average surface area of 10,890 square feet. On a side slope of one to one (that is, 45 degrees), your reservoir would then have a bottom dimension of 98 feet square and a top dimension of 110 feet square. This slope is presumably in

Reduce Your Pump Trouble and Power Bill by Using the

Brisco Gearless Deep Well Pumps

Manufactured at Lindsay, Cal., by

CALIFORNIA HYDRAULIC ENGINEERING & SUPPLY CO.

Head Office, 68 Fremont St., San Francisco.

heavy loam or clay soils. If you have a lighter soil it is advisable to increase the slope to 1½ to 1. This would give you a bottom dimension of 95 feet square and a top dimension of 113 feet square. Should you desire the reservoir to hold 24 hours' pumping, the holding capacity will have to be increased to two acre feet or 87,120 cu. ft.

The best method to use to prevent seepage is a concrete lining of at least two inches thick. In using this lining, however, you should be sure that the banks of the reservoir are thoroughly settled before the lining has been placed.]

LAND LEVELING.

[Written for Pacific Rural Press.]

"Here is S. S. White, the best land leveler of this part of Imperial Valley," said E. Gannon, who has a 200-acre ranch near Seeley. So we asked Mr. White how he does it.

"Just knock the bumps into the low places with a Fresno scraper, throw up border levees, and then finish the job.

"There will be hollows and high places, not very noticeable, but enough to drown or dry out your alfalfa and to make your cotton uneven.

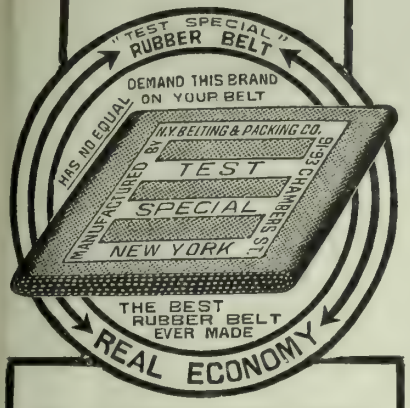
"To get these leveled right, I nail a six-foot wood strip vertically to the partition in an orange box and put an adjustable crosspiece on it about 5½ feet from the ground, set the outfit at the edge of the field where I can sight across it from the field to the horizon. Then stand at a point some distance away, which has been cut down to the proper level of the field.

"If the crosspiece is at tne right height I can sight across it exactly to the horizon while standing straight. Then, in following the scraper, a glance across this stick will show whether to dig out a little or dump a little. When it gets down to fine work, flood the land. This will show up the high places and soften the clods so the scraper can take off as little as an inch, for whatever distance is needed.

"Where there is no level horizon, as in a valley surrounded by mountains, a second cross stick must take the place of the horizon, and the outfits moved to level each check. Even then, it will require estimate work for all points not in line with the sticks, but practice will make this easy."

FIXED WORN PISTON RINGS.

[Written for Pacific Rural Press.]



The piston rings and cylinder of the Samson gas engine of J. E. Dodds of Fresno county became worn so there was considerable loss of power. Instead of having new rings put on, he took the piston to the local agent who had some special wire to fix it with. The wire was hammered out to 1-32 to 1-16 of an inch thick and about ¼ inch wide. Each ring was opened enough so the wire could be pushed around under it. This expanded the rings so that it took nearly an hour to get the piston back into the cylinder, but it has not stuck, and has worked some months since, on the Samson irrigation pump.

DRAINING.

When you drain the water off from the radiator and motor, be sure to remove the plug in the bottom of the pipe leading from the radiator, and open the pet cocks on the pump and lower water manifold. If the water does not run out you must either remove them entirely or open up the hole by running a wire through the hole. Don't let it freeze up.

Longer and Better

BELT SERVICE

We will give you longer and better BELT SERVICE than you are now getting at no greater cost than you are now paying.

Fill out the blank form below, mail it to us today, and we will send you a **FREE SAMPLE** of a Rubber Belt that we will recommend and unqualifiedly guarantee to perform the work satisfactorily; we will also send you free a little folder "How to determine the quality of Rubber Belt." This will give you the standard test for Rubber Belt, so that you can be just as good a judge of Rubber Belt as the man that sells it to you. Don't permit yourself to be sold a cheap Rubber Belt at a price that should obtain for you a high grade Rubber Belt. Send us this information and we will protect you against misrepresentation. STAR DISC HARROWS

Made in 4, 5, 6, 7, 8, 9 and 10 ft. sizes, with 16, 18 or 20 in. discs. Can furnish plain, cut-out or plow-cut discs. With or without weight boxes. Tandem Attachments, Tongue Trucks, Third Lever Attachments, Transport Trucks and Seeder Attachments furnished when ordered.

The steel frame is riveted and braced to the tongue in three places, affording great strength. Low hitch, with tongue and clevis in line of draft, avoiding neck weight. Hard maple oil-soaked bearings, cheaply replaced when worn out. A simple device locks scrapers against discs, away from discs or in position to be operated by foot levers. Each gang operated by its own lever and can be set at any desired angle. Heavy bumpers relieve the bearings of all end pressure. Will do efficient work in dead or back furrows.

A third lever attachment can be furnished which gives more penetrating power and a wide range of adjustments of depth. Highest quality steel discs, carefully sharpened and polished. Curved pull irons hold the harrow level at all angles. P & O Disc Harrows have been made for sixty years and are standard the country over. 'It's the Way We Build Them."

PRUNE GROWERS GET STARTED.

The State Central Committee of the Prune and Apricot Growers Information Bureau held its first meeting Jan. 29 in the directors' room of the San Jose Chamber of Commerce. The meeting was called to order by J. H. Bone who was then chosen chairman of the committee. The State Market Commission Director's nomination of Dr. James B. Bullitt as a member of the S. C. C. was ratified.

George E. Merrill was elected executive secretary and treasurer of the Bureau.

An executive committee was appointed consisting of Chairman Bone, Dr. Bullitt, C. E. Warren, R. P. Van Orden and Sec. Merrill ex officio. In addition to other duties the executive committee is to perfect and report a plan of work and organization to the full committee at its next meeting on Feb. 12.

The use of capacious office rooms for the year was donated by the Farmers' Union in the Union Building, San Jose. Checks in substantial amounts were also donated by several San Jose merchants.

Within a few days the Bureau hopes to be equipped for business and to initiate an active campaign for market and crop information and membership.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Cloverdale will hold its 23rd Annual Citrus Fair from Feb. 18 to 22.

There is at present a bill before the House of Representatives providing for a one-cent-a-pound increase in tariff on oranges and lemons.

A reduction of $12.50 per car on all carloads of citrus fruit pre-cooled and afterwards initially iced between California points and the East, has been announced.

The California Fruit Growers' Exchange is now putting out 100,000 glass orange juice extractors in order to stimulate the orange trade by encouraging the use of orange juice as a drink.

It is risky to bud grapefruit, according to Herman Brusson of Whittier, because the shoots fruit so heavily before the union is strong enough to bear them through any considerable wind.

The Valencia crop from Tulare county is estimated at 1500 carloads this year, an increase of 300 cars over last year. If shipments come up to expectations, it will be the largest crop of that variety ever leaving Tulare county.

An organization known as the Strathmore Early Orange Association was recently established in the Strathmore section of Tulare county. A modern packing house will be erected during the summer, and the fruit marketed through the Mutual Orange Distributors. The following are the directors of the new association: W. M. Hilger, G. H. Collins, E. O. Shoemaker, F. J. Edwards, and E. B. Gould.

DECIDUOUS FRUITS.

The Mills Orchard Company will shortly plant 400 acres to prunes on their property at Hamilton.

C. C. Lester recently purchased the W. C. Stroud ranch of Gilroy, consisting of 30 acres of full-bearing prunes.

H. T. Harrold of San Jose is planting 60 acres to orchard near Modesto; forty will be planted to peaches and twenty to almonds and apricots.

The Directors of the California Peach Growers met Fresno bankers on Jan. 31 to discuss important questions in regard to financing the association.

A shipment of 3000 peach trees infested with the Eastern peach borer was recently destroyed in Ventura by Inspector Essig; it was from a nursery in Kansas consigned to a Ventura party.

The Libby, McNeill & Libby cannery at Selma is shipping to San Francisco the peach pits accumulated during the past season. These are used in the manufacture of by-products, and chiefly for making oil, which as sold as artificial oil of almonds.

OLIVES AND NUTS.

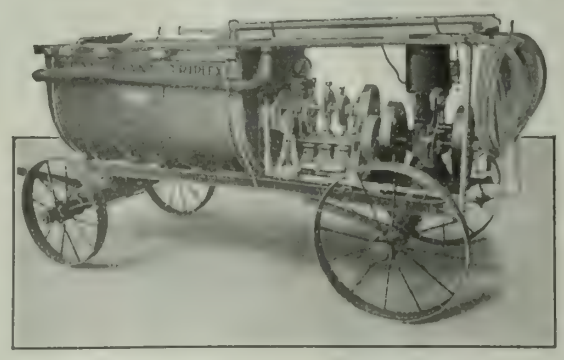
Plans are being made for the celebration of California Ripe Olive Day. Publicity headquarters will be maintained at Oroville and Los Angeles.

The presence of black scale has been found in some of the olive orchards in Placer county and County Horticultural Commissioner Turner has issued a warning to the growers.

A shipment of 1200 almond trees infected with nematod, an insect that causes root knot on young trees, was recently condemned by Horticultural Commissioner Stabler of Sutter county.

The Paso Robles Almond Association met recently and elected the following officers: Paul S. Brown, president; J. H. Van Wormer, secretary and treasurer; C. J. Trussler, delegate to the State convention; and G. A. Mehrhood, H. E. Brooks, and Fred Iverson, directors.

The California Almond Growers' Exchange have announced that delivery of the last lots of the 1915 crop is now being made. The past season's crop was the largest ever produced in California and it is estimated that the returns to the grower-members of the Exchange will be over $1,000,000.

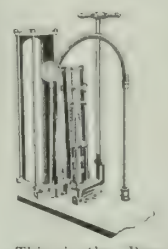


GRAPES AND SMALL FRUITS.

The Italian Vineyard Co. is planting 18,000 walnut trees among their 4000 acres of vines in the sand near Cucamonga. It is intended to interset the whole vineyard.

Only once in the thirteen years J. D. Conrad has been in Imperial Valley, has he noticed rain to speak of in October. This gives grapes a good chance to dry, and dates a good chance to ripen.

Muscat grapes do well in Imperial Valley, according to M. Manoogran, who ships some East every year for Arakelian Bros., besides drying some. They ripen about a week later than Malagas, about July 22. They have 60 acres of these varieties near Grape and 20 acres of Thompsons. The latter are best for the Valley, in his estimation.



A meeting of raisin growers was recently held in Yuba City in behalf of the California Associated Raisin Company, which was addressed by Col. Weinstock and Jas. Madison, President of the Association. A resolution was adopted by the hundred growers present to affiliate with the Associated and to do all within their power to urge other producers to do the same.

The "BEAN" for Results

A spraying outfit may have all the other virtues you might possibly think of—but if it doesn't drive the spray material onto the trees at heavy pressure, and if it doesn't keep up uniform work—it's a failure, and your time and money are largely wasted. The **BEAN** gets results. The sturdy Novo Engine and the Matchless Bean Pump drive the material on at tremendous pressure—so that it reaches every crack and crevice—and does the work thoroughly and completely. You should become familiar with the

10 Big Distinctive Features

This is the Bean Magic, the only hand pump that can be continuously operated at 120 lbs. pressure by one man without exhaustion. Porcelain-lined Cylinders, Ball Valves, and Bean Quality all the way through.

that gives the Bean its prominence. You should know about Bean Porcelain-lined Cylinders, the Bean Pressure Regulator, the Pump without a Stuffing Box, Bean Underneath Suction, the Bean Re-filler, Bean Eccentrics, the Bean Rocking Bolster, Bean Direct-connected Engine and Pump, Bean Interchangeable Parts, and

Bean Threadless Ball Valves

—the valves that cut sprayer troubles in half. Simply bell metal balls revolving on reversible and interchangeable brass seats. No threads to rust, corrode, or stick tight. Can be opened up entirely in less than 2 minutes without lowering the pressure, without stopping the engine, without drawing the liquid from the pump.

The long continued rains will make the call for WEEDERS and MULCHERS very heavy during the next few weeks, and as there is a very limited amount of these tools on hand, it is advisable to get orders in early.

KILLEFER QUALITY

KILLEFER EFFICIENCY

Clean Cut Weeder and Mulcher

It is just what the name implies, the most effective tool for keeping down the growth of weeds after rains or irrigation on orchard, bean, beet, or grain land. It does twice the work with the same team of any other tool for this purpose, and as the knives overlap each other it is impossible to miss anything in their course. Our patented knives are formed with a straight throat so that they wear uniformly from heel to point and are all stamped with our quality trade mark.

The orchardist will find this tool a valuable one for leveling down furrows and for preparing the ground for the cultivator. The large range of work makes it almost indispensable, and the extremely low price at which it is sold brings it within the reach of all. **Made in 4, 5, 6, 8, 10 and 12 foot sizes.**

GRAIN AND FIELD CROPS.

It is estimated that between 700,000 and 800,000 sacks of lima beans remain unsold in California.

It is reported that over 2000 acres will be planted to cantaloupes in Turlock this year, being an increase of about 500 acres over last year.

The first few crates of cantaloupes from Imperial Valley last year were shipped May 14 to New York and sold at $50 per crate. Tom Saitow of Brawley was the grower.

An appeal has been made to the authorities of San Mateo county for relief from the swarms of seagulls that have been raiding the vegetable gardens since the recent storms.

A number of San Francisco capitalists have secured an option on 3000 acres of alkali land near Traver; and should the deal be consummated, it is expected that rice will be planted.

Owing to the difficulty in getting means of transportation to foreign markets, it is reported that approximately 12,000,000 bushels of 1915 wheat still remain unmarketed in the Pacific Northwest.

As a result of a recent investigation on the part of the California Development Board and the California Fish and Game Commission, it has been found that the wild ducks are not a menace to the rice industry as they feed only on the waste product.

It is expected that the largest acreage that has ever been planted will be put into grain on the west side of the San Joaquin this season. Owing to the many cold storms, a good deal of the grain is turning yellow in the sections where there is poor drainage.

The Sacramento Valley Rice Growers' Association has prepared an or- commissioners' authority to proceed in the campaign against water grass. The Board of Supervisors of each rice-growing county will be asked to adopt ordinances to this effect.

J. S. Wooten, who farms 1600 acres on the West side of the San Joaquin, reports that the largest acreage of summer fallow in a number of years will be put in this season when the weather permits. He has 500 acres yet to seed. The main crop there will be barley, owing to the fact that it will be too late to seed oats.

At the recent meeting of the Turlock Merchants and Growers' Corporation, the following officers were elected for the ensuing year: C. C. Carlson, president; A. A. Caldwell, vice-president; F. W. Hosmer, treasurer; and C. C. Carlson, David F. Lane, O. M. Mills, A. A. Caldwell, Manuel Furtado, W H. Lockwood, and D. W. Johnson, directors.

The Theo. Wolf Hop Co. of Sacramento recently made a contract with the lessee of a 120-acre hop ranch near Mayhews for the delivery of 80,000 pounds of hops in 1916, 60,000 in 1917, and 60,000 in 1918. The contract price was 11 cents a pound for the first 60,000 pounds of hops and 10 cents per pound for the amount over that each year.

MISCELLANEOUS.

A 2200-acre ranch is being operated by the State in Napa county for the purpose of supplying farm products to all the State institutions. The work on the ranch is done by honor prisoners from San Quentin.

An illustrated lecture on the selection and planting of shade trees was given at Ceres on Jan. 28 by Prof. John W. Gregg, of the division of landscape gardening and floriculture of the University of California.

A number of Glenn county ranchers have joined together in a campaign to plant shade trees along the highways of all the irrigated parts of the county during the next few months.

As a result of the meeting of the stockholders and directors of the Luther Burbank Company it was decided to throw the concern into liquidation rather than to attempt to refinance it.

The farm bureau meetings have been attracting much attention in Stanislaus county and have been well attended in spite of the stormy weather. This week Farm Adviser Connor has addressed three meetings at different points on the subject of "The Value of the Silo."

POWER FOR SILO CUTTER.

To the Editor: Am going to build a silo this year, and it being rather a hardship to rig completely to fill it, I thought maybe a Ford could be rigged up to run the cutter. Can you advise the most economical and practicable way to do this?—A. G. C., Turlock.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[Ford automobiles have been used to operate power machines in many instances, but the writer is familiar with only one. In this case one of the rear wheels was jacked up and a belt run around the tire to a one-hole corn sheller. The outfit seemed to run quite satisfactorily. Data is not on hand to indicate how much power might be delivered from the rear wheels of a Ford car for power purposes. We would expect 7 or 8 h.p. to be available. The horsepower rating of the motor according to automobile standards is 22½ h.p., but it would not be practical to operate the motor at full speed and it would not deliver its full power to the rear driving wheels.

It is suggested that a good arrangement would consist in a jack to which pulleys might be run from both drivers. This jack would consist in a short piece of shafting carrying 3 pulleys; two to receive the power and one to deliver it to the ensilage cutter. A twelve-inch ensilage cutter will require from 6 to 9 h.p.

There is a device on the market for utilizing the power from an automobile. This consists in friction wheels onto which an automobile is backed.]

You will find many times that if the engine starts to miss fire it is caused from water, and you can stop it by operating the petcock in the bowl of the carburetor and draining off some of it.

HUMUS FOR BACTERIA AVAILABLE.

[By Dr. C. B. Lipman, University of of California.]

While the necessary air, moisture, and temperature conditions are essentials to the development of soil bacteria and to their activities in behalf of the higher plants, they are merely the necessary conditions which make the humus a congenial home, laboratory, and source of energy for soil bacteria. Bacteria are dependent upon the humus supply, because in the heavier soils it tends to allow a better air supply and in the light soils, makes water retention greater. Bacteria depend upon the humus of the soil for carbohydrate material which some of them may use as a source of energy in order to fix nitrogen from the atmosphere. Bacteria depend upon the humus supply for part of their mineral food. They are dependent on it, because it regulates and varies the soil temperature, to their advantage, especially in light soils. Bacteria depend upon the humus supply because it contains largely the nitrogen supply of the soil which through their activities, and only through their activities, can be properly transformed into such compounds as plants are able to absorb. Therefore, the greatest of the practical relationships between soil management and soil bacteria is concerned with the humus.

We have very many light soils whose poor humus supply affects their water-holding power. We have very many heavy soils whose poor humus supply makes them run together, bake, and clod. All of these conditions reduce the bacteria in these respective soils. To improve these conditions we must maintain the humus supply. This we would probably do with greater ease but for the abnormally low humus supply. We must make use first of the materials which will give us the largest tonnage of organic matter which at the same time will decay rapidly enough; and yet will not only give back to the soil the nitrogen that it took out, but add to it the nitrogen which it obtained from the air. This necessitates the use of legumes for green manure crops or a combination of legumes with non-legumes.

We can certainly use to good advantage the vetch and wheat or oats and peas as cover crops so as to give us from the non-legumes a tonnage of material and from the legume crop considerable quantities of nitrogen from the air. For soils very poor in humus, in order that the bacterial activities may be properly encouraged, green manuring should be carried out every season. Even then we may only maintain comparatively low humus content in those soils, especially since some of these green manure crops are bound to be failures or partial failures in unfavorable seasons of rainfall, such as the past one has been. We know that the kind of organic matter which is used as a source of humus makes a large difference in the numbers, the kinds, and the activities of soil bacteria. Some of our investigations now in progress are bringing out striking facts which, however, are not in a complete enough state to report upon. We think, however, they will yield results which will modify to a considerable extent the

practice now in vogue with reference to the humus supply in soils.

PLACENTIA WALNUTS.

[By Dr. L. D. Batchelor, University Citrus Experiment Station.]

The Placentia variety is being planted to a great extent through the southern sections at the present time. It has the Santa Barbara Soft Shell type, and originated in Placentia, California. It is a vigorous growing variety, producing an erect, well-shaped tree which reaches a profitable bearing age fairly early. As a mature tree it is a medium producer but not exceptionally heavy. This variety is not resistant to walnut blight to any degree, as it becomes fully as badly diseased as the average seedling. The Placentia variety has very little merit for the badly blighted regions. The nuts are of medium size, smooth, but of only medium uniformity, as some trees produce quite a proportion of rather rough nuts. The shell is thin but strong, and only fairly well sealed, cracking quite badly during the process of harvesting. The kernel is light tan in color, fairly smooth, and well filled through the nut, mild flavor of medium quality, the harvest season is early. All things considered, this is generally looked upon as the best, thoroughly tried variety for the southern part of the State. It is not known to be particularly resistant to sunburn in the hot inland valleys and therefore the planting of the Placentia should be considered an experiment under such conditions.

WALNUT GRAFTING POINTERS.

[Written for Pacific Rural Press.]

As little exposed cut surface as possible after setting walnut scions is desired by H. R. Dakin of Santa Cruz county. To get all of the cut surface into the cleft, he used to cut a square shoulder deep enough so that the cambium would be in a straight line from shoulder to point. Then when it was placed right at the top, he could know its connection with the stock cambium at the point. The stock would be split slightly and wedged open after cutting a narrow cleft with a semi-circular harness knife to fit the scion. By splitting the stock, the scion could be placed tight without much driving. To drive a walnut scion hard is to risk loosening its bark and killing the scion. A little driving is desirable, however, and the sharp shoulder at the top of the cleft used to cut into the scion bark and loosen it. Cutting a square shoulder was quite a job, anyway. So now he begins the cut on the scion with a deep, sharp curve instead of a square shoulder, and the top edges of the cleft are also rounded off so they won't bruise the scion. Thus with a little care, the cambiums join all the way down and the scion is not bruised. This gives a better percentage.

At the end of the first year the grafts are thinned out, leaving only those on the upper or inside of the stock so they will have less tendency to break out. 1x2 sticks 8 to 12 feet long are nailed beside the new shoots to control their direction. The long first year's growth is too soft to stand sun and frost anyway, so is cut back to four feet and the succeeding new growth tied to the sticks for three years.

Free Library Service to Rural Schools.

[Written for Pacific Rural Press by J. L. Gillis, State Librarian.]

Recently I wrote of the county free library and its numerous ways of giving service to the people, no matter in what corner of the county they may live. Yet another phase of county library service remains to be described, one that rubs the Aladdin's lamp of book service for the children. The advice to "take them young" was never used for results more effectively by any institution than by the library. And one of the places to do this is in the school library. A child given a library habit is pretty sure to continue it in manhood, especially if the community does its share in providing the books for that child when he reaches manhood.

The school system recognized this —and gave it feeble expression— when it first established district school libraries and provided legally towards their support. But there was no thought-out plan, and consequently for the last 44 years the school libraries have been building up an unrelated mass of books and other library material, useless and extravagant.

This has not been the fault of either teacher or trustees, but of the system. Each school district has had a part of its money to set aside as a library fund—usually anywhere between 15 and 50 dollars. This has been spent for supplementary books and apparatus for the schools, and story books for both children and grown-ups. Every school in the county would buy much the same material. Once used it went dead on the shelf till needed next year—grown-up fiction sometimes going to sleep forever. As a result no one ever had anywhere near the library material needed or wished. And all this while the State of California was spending sometimes as much as $300,000 on this service. A clear case of getting nothing for something.

If the county free library could change all this, can any one have the temerity to talk about "taxes"! So successful has the county free library been in changing this condition from waste to efficiency that nowadays teachers who have taught where they have had the county free library service for their school will hesitate to go to teach in a county where the library has not been established.

This change is no miracle, but simply a sane application of business methods to school libraries. It is consolidation, but being co-operative does not come under the Sherman anti-trust law! Instead of each school's having a group of books, nearly all of which have outgrown their usefulness in the district and consequently represent just that much money bearing no interest on the investment, the county free library provides the schools with their library service, making them branches of a library system so complete in its co-operation that it reaches if necessary from the National Library at Washington clear through to the smallest district school library in the most remote mountain canyon.

In order to receive this service, the trustees of any high or elementary school district may transfer to the county free library their district school and library fund. Each school board decides this matter for itself. Spending the money, thus pooled, the county librarian is able to bring about many much-desired results: In the first place, the money being spent in bulk, much better prices are secured, and so the money goes farther; then a book expert is handling the business, and knowing books and prices well, can make careful purchases; then as the books are to travel, fewer copies are often needed than when each school owns for itself alone, for one copy will be used several times instead of going dead on the different shelves.

So far the points have been only for economy. Even if the plan went no further, it would have justified itself, since as good service would have been received, and much money saved. But now comes the spending of this saved money for a better service. Instead of each school's having only perhaps twenty-five dollars' worth of books,—did you ever stop to think that means perhaps only three dollars' worth for each grade? No wonder the children say even before the holidays, "I don't want any of those old books. I've read everything there"—instead, then, of this scarcity, the teacher receives at the beginning of the term a shipment of the books and other library material she needs for the first month or so. As she finishes with them, she sends them back and receives other shipments to take their place. All through the year the fresh material comes and the used material goes, the material needed indefinitely of course staying indefinitely; the material needed temporarily staying as long as needed, and then returning to headquarters to be cleaned, mended, and sent out to another district. Even the very first year of the county free library service to schools in the county, they are bound to receive more than their own money would have bought, and as each year accumulates a larger supply in the county free library, their service increases more and more, till after a few years teachers, superintendents and librarians alike say with satisfaction that the county free library is being able to give unlimited service,—that is, everything the teacher asks for in supplementary books, story books, maps, globes and other apparatus, and a building up of the permanent material, such as encyclopedia, dictionary, and other reference material.

In thirty-three counties which have adopted the county free library plan, over 500 districts have already taken advantage of this method of co-operating for school library service. Their satisfaction has been so great that other districts, advised by their county superintendents, are continually following the example, and bringing, each day, the time nearer when "all the children of all the people" will have as adequate library service as the State of California can give them.

Mario G. Monocal, president of Cuba, in May last bought a 210-acre ranch ten miles out of Havana and has fitted up a model poultry farm. He is experimenting with a number of breeds including White and Buff Leghorns, Rhode Island Reds, Buff Orpingtons, Langshans, and others, including a very thrifty Spanish Fowl called Prats. There is a poultry association in Cuba, the secretary and treasurer of which, Senor D. Noguer, owns a poultry farm at Puerta Blanca, where he has over 2000 fowls, mostly White Leghorns obtained from the United States.

A NEVADA POTATO YIELD WORTH WHILE.

To the Editor: After reading your article headed "Potatoes 24 Tons Per Acre" I thought you might be interested to hear how we are raising potatoes on alfalfa land in Nevada.

In the spring of 1914 I plowed up four and a half acres of old alfalfa and raised a fair crop of potatoes, with what I thought poor seed. From that crop I picked good seed and planted again in the same ground next year, and raised 45 tons of fine Burbanks without an eel worm or any other disease.

For the 1915 crop I plowed the ground in February, did six days' scraping to make it perfectly level, and the first of May I plowed again and harrowed. The 15th of May I put in my picked seed in rows three feet apart. One man did the dropping while I plowed the seed under, using a ten-inch plow. I irrigated to bring the plants up and then let them stand till the leaves were a dark green. After the second irrigation I irrigated them every 10 or 15 days.

I cultivated the field once and then ran a hiller through them so that the water would run through them smoothly. I used a small stream of water so as not to let the tops of the rows get wet and dug the crop with a big digger, October 10. Geo. B. Osborn.

Mason, Nevada.

VALUE OF CORN SILAGE.

To the Editor: I would like you to give the value of yellow corn silage per ton as compared with alfalfa hay, at $10.00 per ton, for dairy feed. Also, kindly give the number of tons of silage in the lower twenty feet of silo, which is thirty-six feet tall and fourteen feet wide. The lower twenty feet is very solid from pressure; the top has been fed out. —L. W. L., Turlock.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[Corn silage can have no definite market value, as it must be consumed soon after being taken out of the silo, and is, moreover, too bulky to be hauled away for any distance. It has a similar feeding value as about one-third its weight of hay, however, so that with alfalfa hay worth ten dollars per ton, silage will be worth $3.00 or $3.50 per ton in the silo.

The late Professor F. H. King, to whom we are indebted for what definite knowledge is available regarding moist silage problems, showed that a cubic foot of corn silage will weigh from 20 to 60 pounds, according to the depth of the layer. It would not be much out of the way to assume that the silage in the lower 20 feet of a 36-foot silo would average about 50 pounds per cubic foot, and this would, therefore, contain around 80 to 85 tons of silage.]

California Garden Flowers

Trees, Shrubs and Vines

By E. J. Wickson. A. M.

The newest, most comprehensive book on California gardening. You need this book every day in your garden work. Every part of growing flowers is given attention and you will be richer and happier by having a copy at your elbow when you need it.

C. H. Shinn of Fresno county, in writing of "California Garden Flowers," says: "But Professor Wickson, toiling slowly, methodically, for a lifetime, has given us in "California Fruits," "California Vegetables," and other books to which list the present volume belongs, as safe, complete trustworthy a review of the entire field as is possible now and here. His name is written across our horticulture, and it is no small literary achievement for him to have done this with his many years of work at the university and as editor of the Pacific Rural Press."

The San Francisco Bulletin says: "'California Garden Flowers' is the best book of its kind ever published. Prof. Wickson's book concerns flower-growing in this particular state, while the great majority of books are general in their scope and the information they contain is of little benefit to local readers. It is a thoroughly practical book for California gardeners, in which every phase of the subject is discussed in detail."

If you are particularly interested in bulb plants, or roses or lawns, soils, fertilizers, or if you have bacterial or insect troubles, "California Garden Flowers" will assist you. The book contains nearly 300 pages of closely printed text, besides numerous illustrations, is handsomely bound in cloth and will be sent postpaid for $1.50 per copy.

525 Market St., San Francisco

Can Dairying be Made to Pay?

To the Editor: With first class cows selling for $75 a head (average 20 lbs. milk a day), alfalfa hay at $12 per ton, land that will average 15 tons silage corn to the acre and is worth $50 per acre for beans, and milk selling at $1.80 per cwt., will dairying pay? What is the cost per day to feed a cow?—Subscriber, San Luis Obispo.

[Answered by R. L. Adams, University of California, Berkeley.]

[No data is available for this State based upon careful, detailed investigation in the dairy costs, but the following will serve as a fair guide. It is based upon the submitted data, considering three hundred milking days per year.

Where corn—green, fodder or silage—and alfalfa are the available feeds, the cost will be about $3.00 per ton for corn, and in this case, $12.00 per ton for alfalfa, hence the total feed costs will be:

5½ tons of corn at $3.00...$16.50
3¾ tons of hay at $12.00.... 45.00

Total feed $61.50

making the daily feeds cost a little over 17 cents, when the yearly feeds average 30 pounds of corn and 20 pounds of alfalfa daily.

With cows yielding 20 pounds of milk for 300 days, 6,000 pounds of milk will be available annually. The cost of the various items, per cwt. of milk produced, will be:

Feed .....$1.03 per cwt.
Labor (32 per cow annually) ..... .54 "
Use of buildings and corrals ($7.00 per cow annually)..$12.00
Overhead (insurance, taxes, interest, and depreciation on cows at $75.00, use of equipment and incidentals, at $15.00 per cow annually).. .25

Total costs $1.94
Credit calf at $6.00; manure $6.00 (assumed, may have no value) .....$ 20
Cost of 100 pounds of milk ...$1.74

From this it appears that dairying with 20-pound cows, under the conditions given, will result in about an even break. It will reimburse the owner for labor, for the purchase of hay ($12.00 is a high price for dairy hay), use of capital, and wear and tear of stock and equipment. It will not permit a very wide margin of profit, especially if all labor must be hired.]

The Sacramento Hog Sale.

[Written for Pacific Rural Press.]

Sheltered by Agricultural Hall at the State Fair Grounds, from one of the fiercest storms of the winter, a fairly good sized crowd of farmers and breeders were in attendance at the first annual auction sale of the California Swine Breeders' Ass'n. last week.

The extremely cold weather seemed to reflect itself on the enthusiasm of the buyers during the forenoon, when a number of useful animals were knocked off at less than pork prices.

After lunch there was an improvement in this respect, which continued long enough for auctioneer Ben Rhodes to dispose of a goodly number at very satisfactory prices. This did not last, however, and the final hour or so of the sale was a repetition of the forenoon's experience, namely, the sacrificing of many good breeding animals at prices considerably lower than they can be purchased elsewhere in the State.

Altogether there were 102 head sent through the ring, the average price of which was a trifle over $35 a head. Of this number, the Duroc Jerseys made the highest average, 17 head of sows averaging $61 each, 12 boars $32 each, making an average for the breed of $49 on the entire 29 head.

Berkshires came next with 12 boars averaging $27 each, 27 sows averaging $41.50 apiece, making an average for the 39 head of $37.

Five Chester White sows averaged $35.50, the one boar selling for $20, which brought the average of the breed down to $32.90.

With a large offering of Poland China boars the average for this breed was $21.60. The 16 boars averaged $18.75 and the seven sows $28.

While not satisfactory as the above figures show from a financial standpoint, it is nevertheless a fact that much good should result from the sale, inasmuch as it has brought out many points relative to selling of purebred livestock, by the auction method, which only experience could develop.

One of these is the proper time of the year for the holding of such sales. It seems apparent that even in California, winter weather cannot be relied upon and that weather is an influencing factor in days of extensive auto traveling, like the present.

Another point which undoubtedly has a great influence on prices is uniformity in the offering. If there were ever any doubt that auction sale buyers are equally as discriminating, if not more so, than buyers elsewhere, such doubts should be dispelled by last week's experience. It follows selling experience in other lines, that seconds depress the market for tops. Many a good hog sold low last week, largely because a poor one preceded him in the ring, even though the latter one may have sold at, or near, his real worth.

Condition is another influencing factor, and while "working clothes" may be better for utility purposes than "high finish," it seems evident that most auction buyers, like most show ring judges, prefer seeing the fat on the hog rather than in the grain sack. This condition had a material effect on the prices received for the Duroc Jerseys, for be it said to their credit, the Duroc breeders were far-sighted enough to put animals in the ring of uniform good breeding and good finish, and further, they helped the sale of their animals by ring managership, which is supposed to be a business of itself.

It should be borne in mind by prospective hog buyers that the prices at this sale were neither representative of the quality of all the animals sold, or of the prices one must pay for the same class of animals at breeders' farms. The shaving of last week's prices was due more to inexperience in the auction method of selling hogs, than anything else and as such was an unfortunate instance for those consigning.

There were nearly 50 buyers, of which the heaviest purchasers were A. B. Humphreys, W. J. Edinger, Elder Creek Farm, C. A. Christen, G. P. Robinson, E. K. Carnes, Del Dago Farm, L. C. Crellin, Dr. E. J. Weldon, A. M. Bracken, F. Loudreth, H. Marsh, G. R. Shurey, J. L. Dienstag and G. C. Francis.

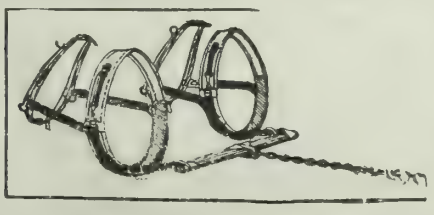
To Regulate City Milk Distribution.

[Written for Pacific Rural Press.]

With a determination to better their conditions through co-operation, nearly 100 dairymen were present at the meeting of the Bay Counties Dairy Co., held in San Francisco, February 1, at which time the final subscriptions to the $45,000 fund were secured, which will be used in establishing a whole milk distributing plant as outlined in our issue of January 1.

This gives the association control of 18,000 gallons of milk out of a total of 28,000 consumed in San Francisco, the rate of subscriptions being $25 for each 10 gallons of milk sold through the association.

It was brought out at the meeting that since the earthquake in San Francisco, all attempts to secure a fair price for market milk, through co-operation with the milk distributors, have failed, due to the fact that the producer had no organization back of him, strong enough, financially, to demand his rights, but that he was being met on the other hand with a strongly organized distributor, who dictated both the price to the producer and to the consumer.



With the above named fund it is intended to erect a distributing plant, where all milk of association members may be shipped, and resold in wholesale quantities, providing such procedure is deemed necessary, in order to get a fair price for the producer.

Col. Weinstock was present at the meeting and spoke of the desire of the State to aid all legitimate co-operative enterprises of producers and summed up the market milk producers problem like this: Producers have no chance to sell right individually, especially when the men they are selling to are well organized, as is the present case with the market milk problem in San Francisco. He believes that the organization plan of the dairymen's association is a good one because each member has money involved which binds them closer together than anything else could.

After listening to several speakers, a recess was declared by the chairman, for the completion of the subscription list, which was still $2500 short of the desired amount. This was secured in a short time and immediate steps will be taken by the directors of the association to work out plans for the handling of next season's milk.

Unusually Considerate. — Miss Milly was rather a talkative young lady. Her bosom friend, having missed her for some time, called to find out the reason. "No, mum, Miss Milly is not in," the maid informed her. "She has gone to the class." "Why, what class?" inquired the caller in surprise. "Well, mum, you know Miss Milly is getting married soon, so she's taking a course of lessons in domestic silence."—Tit-Bits.

Farm Curing of Meats.

In answer to several queries recently received on ways of curing meats we take the following from Farmers' Bulletin 173 of the U. S. Dept. of Agr. A chapter is also devoted to the home curing of pork in our California Hog Book, full particulars of which can be secured by writing this office.

Corned Beef—The pieces commonly used for corning are the plate, rump, cross ribs, and brisket; or in other words the "cheaper cuts" of meat. The pieces should be cut into convenient pieces, say five or six inches square. It should be the aim to cut them all to about the same thickness, so that they will make an even layer in the barrel. Weigh out the meat, and allow ten pounds of salt to each hundred pounds; sprinkle a layer of salt one-quarter of an inch in depth over the bottom of the barrel; pack in as closely as possible the cuts of meat, making a layer of five or six inches in thickness; then put on a layer of salt, following that with another layer of meat. Repeat until the meat and salt have all been packed in the barrel, care being used to reserve salt enough for a good layer on the top. After the package has stood over night, add, for every 100 pounds of meat, four pounds of sugar, two ounces of baking soda, and four ounces of saltpeter dissolved in a gallon of boiling water. Cool and add three gallons more of water, which should be sufficient to cover this quantity of meat. A loose board cover, weighted down with a heavy stone or piece of iron, should be put on the meat to keep all of it under the brine. In case any should project, mold would soon start and the brine would spoil in a short time. If the meat has been corned during the winter, and is to be kept into the summer season, it would be well to watch the brine closely during the spring, as it is more likely to spoil at that time than at any other season. If the brine appears to be ropy, or does not drip freely from the finger when immersed and lifted, it should be turned off and new brine added, after carefully washing the meat. The sugar in the brine has a tendency to ferment; and, unless the brine is kept in a cool place, there is sometimes trouble from that source. To secure thorough corning, the meat should be kept in the brine twenty to thirty days.

Plain Salt Pork.—Rub each piece of meat with fine common salt and pack closely in a barrel. Let stand over night. The next day weigh out ten pounds of salt and two ounces of saltpeter to each 100 pounds of meat, and dissolve in four gallons of boiling water. Pour this brine, when cold, over the meat; cover, and weight down to keep it under the brine. The pork should be kept in the brine until used.

Sugar-Cured Hams and Bacon.—When the meat is cooled, rub each piece with salt and allow it to drain over night. Then pack it in a barrel with the hams and shoulders in the bottom, using the strips of bacon to fill in between or to put on top. Weigh out, for each 100 pounds of meat, eight pounds of salt, two pounds of brown sugar, and two ounces of saltpeter. Dissolve all in four gallons of boiling water, and after cooling cover the meat with it. Bacon strips should remain in the brine four to six weeks; hams six to eight weeks. This is a standard recipe and has given the best of satisfaction.

Smoking Meats.—The best fuel for smoking meats is maple wood, smothered with sawdust of the same material. Hard wood of any kind is preferable to soft wood. Resinous woods should never be used, as they are likely to impart bad flavors to the product. Corncobs are the best substitute for hard wood, and may be used if desired.

SHEEP FORAGE FOR SELVES.

[Written for Pacific Rural Press.]

What a few sheep will do without trying is shown by T. W. Davies of Imperial county whose flock has been furnishing mutton and beef for the family for 10 years without expense except the foundation. No new blood has been bought since the Navajo foundation ewes were crossed with Cotswold bucks. Ewe and buck lambs have been kept for breeding until recently the last buck was butchered at 14 months and dressed 108 pounds. That better breeding would have produced better results goes without saying; yet the dozen ewes he now has are thrifty and are, in the middle of January, beginning to lamb, but not very satisfactorily, partly because they are too fat. Two of them are 10 years old and with lamb. The Navajo constitution has held up the vigor of the flock.

The sheep have had, only "Imperial Valley shelter"—the open sky—except at lambing time when ordinarily they may rest under a brush roof on fence posts. Two lambs were recently presumably eaten by coyotes, since the ewes were in a pasture with the horses, away from the house.

They have had no feed except what they picked up about the ranch with the cows and horses. They do not get into water or mud very much, yet they are a great help in keeping down the Bermuda grass which has infested ditch banks of the region. Tall grass and weeds grow quickly in the ditches in the hot summer; and almost in proportion to their height, they catch the river sediment which necessitates ditch digging three or four times a year; but which if spread on the land would enrich it. Sheep save the cost of mowing the grass and much of the mud shoveling. Hog-tight wire is needed to confine them.

They have been sheared in spring for their comfort only, since the wool market was absent—sometimes their carcasses were exchanged for beef. There is a wool buyer now in El Centro, so the future shearings will be saved for a little extra money. However, it is a mutton variety that Mr. Davies believes is needed.

S. Young, one of the pioneer grain farmers of Stanislaus county, realizes that the greater part of his land is too valuable for grain and is preparing to enter the dairy and hog game. He is checking and seeding 165 acres of his land for alfalfa this season and is erecting a modern dairy barn. He has a herd of grade Holsteins and is using a purebred bull from the J. Benoit herd of registered Holsteins.

Bassett's Medium Type POLAND CHINAS

Grand Champion Sow.

Won $2145 in cash prizes at
PANAMA-PACIFIC INTERNATIONAL EXPOSITION.
Grand Champion, Senior Champion and Junior Champion Sow.
Reserve Grand Champion and Junior Champion Boar.
First on produce of Dam; First and Second on Get of Sire; First on Aged Boar; First on Young Herd; First on Aged Herd and Young Herd Bred by Exhibitor, Etc., Etc.
The following Boars are in service in my herd:
Hustler 191721. Hustler's Model 238217.
Perfect Hustler 238209. Chief's Victor 238215.
Gold Coin 3rd.

My brood sows are all of my own breeding, and after years of selection, during which steady improvement in quality has been my constant aim, the present breeding herd carries the blood which has been the foundation of this herd of consistent prize-winners. These are the kind of Poland-Chinas that produce pigs that are uniform, that have all the size that is necessary, that mature quickly, and grow into pork at a minimum of feeding expense. Choice breeding animals of both sexes from this prize-winning blood. Price from $30 up.

Correspondence solicited. Visitors cordially welcomed.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

CALIFORNIA Hog Book

In commenting upon the California Hog Book, the Colusa Sun says: "It contains 252 pages, 31 illustrations and 22 line drawings. It is an invaluable book to the man who is engaged in or contemplates raising hogs, as it deals with different strains, breeding and other information pertaining to the hog industry."

Price, $2.00 Postpaid.

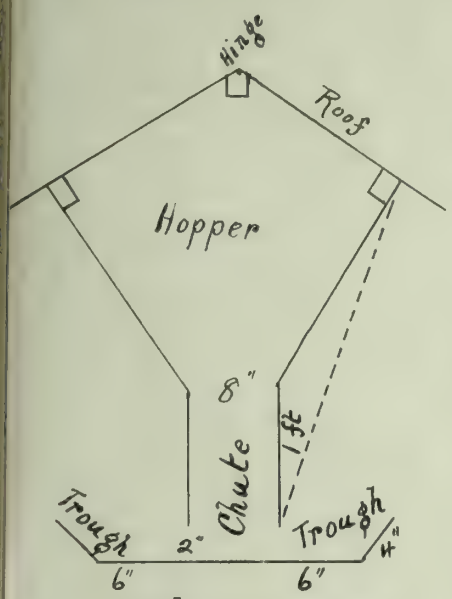
M. HOLDRIDGE, MODESTO, CAL.



Self Feeder for Hogs.

To the Editor: Will you give me directions for making a self-feeder for feeding tankage, grain, etc., to hogs?—P. B. L., Tulare.

[Answered by Wm. T. Chapple, Fair Oaks Ranch, Willits.]

[We are now using the self-feeder, shown in illustration, and find it very satisfactory. For a Berkshire it is better to have the chute on account of their short nose, but for a long-nosed hog the hopper can slant down to base of chute as indicated by dotted line, which should be about two inches from base of trough, which is six inches wide. In this way the hogs lick the feed out and do not waste any.

These feeders are very simple and can be made any size, according to the number of hogs fed or the quality of the feed. We divide ours into several compartments, by partitions, so that one feeder several feet long can be used for minerals (in separate compartments) also grain. The roof, if used outdoors, would have to be like drawing, otherwise could be flat or not have any. Chute should be from six to eight inches at bottom.

Home-Made Self-Feeder for Hogs.

We are using a feeder like this 36 feet long, running through the center of our feeding room, with concrete feeding floors on each side. In it we feed the grain, tankage, minerals, etc.]

BEET PULP FOR FATTENING HOGS.

To the Editor: Will you tell me if there is any fattening properties in beet pulp when fed to hogs? I mean the wet pulp that one can get at the sugar refineries for 50 cents per ton. Am told it is good for feeding cattle but can not learn from anyone around here what effect it has on hogs.—W. H. R., Patterson.

[Comments by F. J. Greer, Supt. Spreckels Sugar Co., King City.]

[Regarding wet beet pulp for hog feed, will say that we have been feeding beet pulp to hogs for the last two years. Last year as an experiment and this year as a permanent feed both for growing and fattening. At present we are feeding it to a bunch of pure bred Duroc-Jerseys with good success.

While the feeding of wet beet pulp to hogs is practically a new thing in this valley, all those who have tried it have been well pleased with the results. I do not know of a feed that will take the place of beet pulp as a hog feed where feed cost is taken into consideration.]

[If others have had experience with wet pulp for hogs we should be pleased to hear from them.—Eds.]

PULLING WOOL FROM SHEEP PELTS.

To the Editor: Will you kindly publish a recipe for pulling wool from sheep pelts, the same that is used in general by butchers and tanners, also, give instructions of use? We cannot get near the price of wool for sheep pelts.—L. S. S., Henleyville.

[Answered by Prof. R. F. Miller, University Farm, Davis.]

[Regarding the method of pulling wool from sheep pelts in the wool pulleries there are several in use. First, the lime method of painting the flesh side of the pelt soon after it has been removed from the carcass, with a solution of lime, leaving it over night, and the next morning the wool will come off readily. This treatment, however, is rather severe on the wool fiber and makes it tender. The one most extensively used is painting the pelts with a solution of sodium sulphide, leaving them over night and the next day the wool can be pulled off. I question whether it will pay to pull wool off pelts unless it happens to be a very long fiber, because the pelts with the wool removed are hard to sell. The writer has simply clipped long wool off sheep pelts with a pair of shears, and in this way sold the wool and pelt separately.]

ANALYSIS OF CHEAT.

To the Editor: What is the nutritive value of cheat (the seed) for poultry? Also for horses and cows? Please answer the above through the Pacific Rural Press, as there are several in this locality who would like something authentic on the subject. Opinions vary greatly among those I have talked with.—C. R. C., Proberta.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[It is common in this State to call darnel (Lolium temulentum) cheat, while elsewhere this term stands for an annual plant belonging to the genus Bromus, a common weed in grain fields and waste places. Darnel is usually considered good green feed in this State. I am not aware that the seed has ever been analyzed; at least I can find no records of its chemical composition. Owing to the small size of the seed they would not be apt to be of much nutritive value for either poultry or other livestock, as they would pass through the digestive apparatus of the animals practically uninjured. If cheat is grown in Tehama county and the seed fed to farm animals, readers of the Press, and I among them, would be glad to be informed of the fact and of the practical experience obtained in feeding it.]

The meeting of the SonomaNapa Counties Cow Testing Ass'n was held at Napa last week, at which time the tester for the association reported that he had tested 900 cows during the past six months.

REDWOOD TANKS

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

J. S. Gibson Co., Box 97 Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

40 Shorthorn Bulls and Heifers

REGISTERED AND TUBERCULIN TESTED.

NOW, at my farm at Perkins, 6 miles East of Sacramento. This stock was purchased from the best herds in Nebraska for my California trade, and are as fine a lot of one and two-year-olds as I could secure. Inspection invited. Call and see them before purchasing elsewhere.

Also have a few registered **BERKSHIRE GILTS** for sale.

I will leave shortly for the East to fill orders for Shorthorns and Herefords. Write me at once of your wants so that I may fill your order on this trip.

H. L. MURPHY

PERKINS, SACRAMENTO CO., CAL.

Brighton Herd of Shorthorns. Established 1880.

Second Thousand Answered Questions in CALIFORNIA AGRICULTURE

Our latest book, just from the press, contains 256 pages of text, cloth bound, and sells for $1.50 per copy.

This book is made up of questions and answers. Divided into nine parts, covering fruit growing; vegetable growing; grains and forage crops; soils, fertilizers and irrigation; live stock and dairy; feeding animals; diseases of animals; poultry keeping; pests and diseases of plants.

The live stock and dairy, the diseases of animals, and pests and diseases of plants are very fully covered. We believe that there has never before been printed such a complete list of sprays and poisons and tables for use as are here given.

You need this book in your library. It will come in handy every day in answering some bothersome question which may need quick action. The carefully compiled index tells you where to locate the information you want at a glance.

We want to send you a copy. Send for our special offer made to every one of our subscribers.

DAIRYING.

Dairymen in the vicinity of Gilroy are said to be improving their grade herds by the use of purebred bulls.

A. M. Bibbens of Stanislaus county received a young registered Holstein bull from the O. N. Kellogg herd in New York last week.

A report from Orland states that over $60,000 has been paid out during the past month by one creamery in that town for butter fat received during the past eight months.

Dispatches from New York say that several large shipments of butter have recently left there for Russia. These are said to be the first shipments ever made from America to that country.

We are advised by A. W. Morris of Woodland that he expects Tilly Alcartra to make around 1200 pounds of butter and about 30,000 pounds of milk in her official test this year, which has about 50 days to run.

Mr. C. E. Denman of Petaluma has purchased a 320-acre tract of land in Tulare county which he will turn into a dairy at an early date. He will ship a number of dairy cows from his father's herd at Petaluma, as soon as the ranch is developed.

With the manufacture of nearly one and a half million pounds of butter the Visalia Co-operative Creamery at Visalia broke all previous records during 1915. At a meeting of the directors held recently S. T. Pennebaker was elected president of the company and N. J. Beck was retained as manager.

The average cost of producing butter at the Dairymen's Co-operative Creamery Association's plant at Tulare last year was 1.40 cents per pound and the sales cost 1.16 cents a pound. The manager's report for 1915 showed the total sales of the creamery to have been $623,604.72 for the year. Over two million pounds of butter were made.

The California Central Creameries have bought stock in the Imperial Valley Creamery Co. and are building a new $45,000 creamery at El Centro besides putting a $2,000 addition to the old creamery which will all be used as a casein factory. Equipment in the new creamery, now being made in New York, will cost $45,000 or $50,000 more.

Whole milk instead of cream is desired by the Imperial Valley Creamery, according to its manager J. A. Robinson. This is because dairymen will not take proper care of the cream to enable the creamerymen to make 93 scoring butter. Whatever cream is bought after Feb. 1 will have to be fit to make 93 butter in order to receive the Grade A price. The whole milk project is favored by Imperial county producers.

F. H. Van der Poel of El Centro has a registered Jersey cow, Fern Silver Ray, which made 255 pounds fat on official test, from Sept. 20 to Jan. 1, being kept in an open corral and milked twice daily. She is now being fed 3 or 4 pounds cotton seed per day besides 5 pounds dried beet pulp soaked, 9 pounds rolled barley, and alfalfa hay cut before blossoming. She is 5½ years old, calved Sept. 15, produced 438.7 lbs. milk and 22.417 lbs. fat in Sept. beginning the 20th, 1441.7 lbs. milk and 73.67 lbs. fat in Oct. with a test of 5.11 per cent, 1375.3 lbs. milk and 81.211 lbs. fat in Nov. with a test of 5.905 per cent, and 1291.3 lbs. milk and over 75 lbs. fat in Dec. with an average test of 5.834 per cent. Her best day's milk was 52.2 lbs. The test is being continued for a high yearly record.

SWINE.

Two carloads of hogs were shipped from Salinas last week, one to the San Francisco market and one to Kings City.

E. C. Curtis, Duroc breeder of Napa, reports having recently sold 10 eight-month-old gilts to H. Diveneck of Ukiah, one sow to A. B. Johnson, one sow to G. Winfry and one sow to Dr. Robinson.

A dispatch from Fort Worth, Texas, says: "A contest in the art of calling hogs, it was announced today, will feature the State encampment of agricultural clubs here in March. Boys alone will be eligible.

A purebred Berkshire herd is being founded on the recently acquired Roberts Island ranch belonging to Mrs. John F. Merrill of San Francisco. A large farrowing house has been completed and other buildings are under way which will make the establishment one of the best in the Sacramento valley.

W. T. Sessnon, who was a liberal purchaser of Berkshires at the P. P. I. E. and who has since made goodly purchases of Shorthorn cattle, is making a number of improvements on his ranch near Bradley, Monterey county, and expects to have one of the most up-to-date breeding establishments along the coast.

At a meeting of the Stanislaus County Farm Bureau, held in Modesto last week, it was decided to take immediate steps toward the eradication of hog cholera and other contagious livestock diseases in the county. An effort will be made to have county ordinances passed which will aid in preventing the spread of such diseases.

A. M. Henry of Farmington has two young boars on the way to head his large herd of Poland Chinas. One of these boars was purchased from Peter Mow, of Iowa, and the other comes from the herd of W. Hather, Ord, Nebraska. Mr. Henry is keeping 15 head of brood sows at the present time and states that he is finding difficulty to supply the demand.

A. D. McCarty, owner of the Riverina Farm at Modesto, writes: "Since the Exposition we have sold 7 boars and 31 bred gilts. The following are some of the purchasers: J. Campbell Shorb, Santa Cruz Island Co., Timken Ranch Co., Dr. E. H. Smith, A. L. Tubbs Co., J. G. S. Hubbard & Sons, C. H. Wooley, W. H. Ringen, Chas. H. Tointon. Mr. Shorb got Riverina Ranger 2nd, P. P. I. E. Grand Champion Boar.

There are 2300 head of hogs on the Pacific Land & Cattle Co.'s ranch near Imperial, of which 500 are brood sows from which at least 2400 pigs are expected in the March farrowing, according to T. H. Dills who has charge of them. They have 21 boars, all purebred of five different breeds. Those in which black predominates seem best adapted to this ranch, which raises hogs to be fattened at the local packing house.

HORSES.

A San Francisco buyer has been in Chico the past week, buying horses at prices of $75 to $125. He states that he is in the market for 1,000 head.

A Nevada horse buyer is making a trip through Mendocino county looking for horses. He is said to be in the market for 500 head. It is supposed that he is buying for the Denver market where many of the foreign army buyers are making their headquarters.

SHEEP.

Coyotes are said to be killing eight to ten sheep a night on the Dillon ranch in Browns Valley, Napa county.

A report from Colusa states that Fred Mendonsa lost 300 head of sheep on low land near that place last week.

The unusual wet weather is said to be causing considerable loss of lambs on sheep ranches in the lower part of Monterey county.

About 800 sheep belonging to T. W. Harlan of Willows narrowly missed drowning last week when high water caught them on the Green ranch.

The Nevada State Sheep Commission has subscribed $10,000 to be used in exterminating rabies in that State. The State Cattle Commission donated a like amount and it is probable that the State will add materially to the fund.

Due to the losses by coyotes which have occurred in past years, K. Ford of Mendocino county intends herding his sheep in the future. In the past this has not been considered practicable in that section due to the ruggedness of the country.

Reports from Elko, Nevada, say that winter feeders of sheep south of Eureka are becoming alarmed at the growing scarcity of feed due to the heavy snow which is on the ground and that several large orders for cottonseed meal have been placed in an effort to carry the flocks over till wild feed is again available.

BEEF CATTLE.

Shipments of livestock from Imperial valley are reported to be large at this time. A trainload of 45 cars left the valley as soon as the tracks were repaired after the late heavy rains.

A trainload of Nevada cattle were received at Oakdale last week, consigned to F. R. Gatzman and R. E. McCormick who have a fine range

WANTED TO HEAR FROM OWNER of good farm for sale. Send description and cash price. R. G. List, Minneapolis, Minn.

above Keystone. The cattle were shipped from Winnemucca.

Heavy shipments of both cattle and sheep have been waiting better rail facilities for some time in Nevada. The shipments will be made to Pacific Coast points as soon as weather conditions permit, according to dispatches from Reno.

At the annual meeting of the National Livestock Ass'n held at El Paso last week steps were taken to eliminate market fluctuations and to combat alleged combinations of other interests which tend to keep down the price of cattle. It was brought out at the meeting that sheep men and cattle men are to co-operate in securing some definite form of federal control for the unappropriated, unreserved lands.

The Ormondale Farm, situated near Redwood City, is beginning to stock the farm with the best of Shorthorn beef cattle. This company purchased a bull at the cattle show in Portland in Dec. for $1200, called Golden Goods Jr. Also two prize yearling cows sold at auction from the Gibson Estate Co. They also purchased ten cows and their calves, the choicest in the herd of A. D. Dunn, of Wapato, Wash.

As an evidence of their appreciation of the good results from the Northwest Livestock Show, held annually at Portland, the American Shorthorn Ass'n has appropriated $2500 for premium money at that show next year and the American Hereford Ass'n has made appropriations for the same amount. This is the largest prize fund given to any show by these associations except the International Livestock Show at Chicago.

IS GOAT IN KID?

To the Editor: I have a goat that was supposed to be fresh about two months ago, according to the man I secured her from three months ago. She hasn't come yet though she looks kind of pouched and her bag looks more solid than before. She looks in fine condition. Can you advise me about her? Is there any way that I can find whether she is with young?—O. T., Downey.

[Answered by Prof. E. C. Voorhies, University Farm, Davis.]

It is a very difficult matter to tell whether or not a goat is with kid. If the goat's udder is solid and hard it should be rubbed every other day with lard or vaseline. You will find that this will keep the udder in better condition than if left without anything of the sort. It may be that the man from whom you purchased the goat was mistaken about the breeding. The only thing to do is to keep the udder in good condition and await results, as I do not know of any way in which you can tell whether or not the goat is with kid.

Stringing Us?—Speaking of the eternal fitness of things, possibly it has escaped your notice that Etta Bean lives in Boston.—Columbia State.

LIVESTOCK DIRECTORY.

HORSES AND MULES.

FOR SALE—Large-boned, purebred mammoth Jacks. Best of breeding. Prices and terms reasonable. Satisfaction guaranteed. J. A. Dickinson, Fresno, Cal.

REGISTERED SHIRES—Black Hawk Stock Farm Importers and Breeders. Easton & Ward, Proprietors, Burlingame, Cal.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practical and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

YOUNG'S POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

BILLIKEN HERD of registered O. I. C. Swine. Pigs of both sexes from March, April, May and June farrows. Four sires used: Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. All the dams are the smooth, big type. A few bred sows to offer. Everything is cholera immune. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915, I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind I don't have to auction them off. John P. Daggs for prices, Modesto, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Advancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

RANCHO RUBIUS HERD DUROCS—Won 1st under six months, Junior Champion, Reserve Grand Champion, Champion Sow bred by Exhibitor, 2nd Sow under 2 years, and two other premiums, all on four entries at P. P. I. E. A few service boars and weanling pigs for sale. Elmer Lamb, Ceres, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

SOW WON'T BREED.

To the Editor: I have a registered sow that fails to come in heat. Her last litter is nearly a year old. She came in heat twice after pigs were weaned, but at that time I didn't want to breed her. Is there anything that can be done or will I have to kill her?—G. A. W., Shandon.

[Reduce her ration and give her plenty of exercise. Give her two drops Fluid Extract Nux Vomica twice a day.]

UDDER SORE.

To the Editor: Some time ago one of my cows had a milk sore at the front of her udder, which became infested with maggots before I noticed it. I have not been able to heal it up and it now gives off an offensive smell and is about the size of a half dollar. The cow is dry. When she was in milk her udder seemed to hurt her when being stripped. Please advise treatment. H. D. W., Oswald.

[Paint this sore with tincture of iodine three times a day, working it in well, till healed.]

CURE FOR SCOURS DOUBTFUL.

To the Editor: I notice an inquiry from a subscriber, in a recent issue, regarding scours in calves. I find the following receipt a perfect cure in my dairy at Elk Grove: Fill a quart bottle half full of air-slaked lime, then fill the bottle full to top with cold water. Shake well and let stand till water clears. To a quart of warm milk from the cow add one or two tablespoonfuls of the lime water and feed it to the calf at each feed, twice a day, but it is best not to overfeed or starve the calf at first. The calves are kept away from their mothers two or three days (if nursing), depending upon their condition of improvement. If not nursing, continue treatment till well. Calves should be treated as soon as taken sick. Too often they are neglected till inflammation or indigestion are too far along.—Mrs. A. C. Freeman.

[This might work in a few cases of simple diarrhoea but never in diarrhoea caused by microbean infestation.]

SOW'S LEGS BAD.

To the Editor: I have a brood sow that got lame in one of her hind legs, and remained lame for some time, finally getting over it. Then she got lame in a front leg and has been that way for three weeks. Now her leg is badly swollen, also her foot. She refuses to try to walk on it. She weighs about 300 pounds. Kindly advise me of treatment.

[Bandage the swollen parts with Antiphlogistine as per directions in the package. Give five grains Sodium Salicylate and five grains Hexamethlyamine three times a day in water.]

TOO MUCH TURPENTINE.

To the Editor: I saw in the issue of December 11 a prescription for worms, given to a mare nine years old: three ounces of turpentine followed six hours later with a quart of raw oil. I thought my mare was wormy, as she was a great feeder but wouldn't get fat, so gave the remedy prescribed. About 24 hours after her throat began to swell, she refused to eat, was thirsty but could not drink, and had two convulsions. The oil did not physic her till the third day. The fourth day she got so weak she couldn't stand up and seemed to begin to bloat, so I killed her. What was the real trouble, and was it caused by turpentine?—F. J. H., Escalon.

[Your trouble was caused by the turpentine being given without diluting it. Imagine taking a few drops of turpentine yourself, without dilution.]

PIGS DO NOT HAVE PILES.

To the Editor: Have a sow with six pigs about two months old and four of them look just like they had piles, as their rectums protrude an inch or two. What is the trouble and is there a cure? Also have a cow that freshened with her second calf about two months ago, that gives bloody milk out of one quarter. She was affected the same way before I dried her up the last time. She is in good condition and this quarter was never bruised so far as I know. What do you think is the trouble?—J. W. L., Visalia.

[Pigs do not have piles. Give them a good purge with Epsom salts, two ounces to each 100 pound weight. The cow has an infected udder. Give one ounce each, Fluid Extract Phytolacca and Ecohinacea twice a day for one or two weeks.]

MULE HAD FARCY.

To the Editor: I have a mule that seems to have the rheumatism. She has a good appetite and is in good flesh, has a very good glossy coat of hair, lays down quite often at nights, groans a great deal as if in pain and seems to take much effort in getting up, stumbles easily and reels while walking. She had "Farcy" last summer. While she is not a young animal neither is she very old. Can you recommend a cure through your columns?—F. M. L., Orosi.

[If this animal had "Farcy" last summer and the State Veterinarian were to hear of it he would destroy your animal, as "Farcy" is glanders. Give the mule one and one-half pounds Epsom Salts at one dose.]

ABSCESS FORMATION ON UDDER.

To the Editor: I have a cow whose udder is badly swollen between the front teats. When I first noticed it two days ago the surface looked a whitish cooler, but now it has taken on a deep cream color. Another place where the udder joins the leg looks wet all of the time and has a bad odor. Cannot find any spot where the discharge comes from. Milking seems to pain her. Have not been able to relieve her. Will you give me treatment?—J. W. H., Loomis.

[This is abscess formation due to infection. Bathe the bag three times a day with one per cent solution liquor cresolis compositus, well warmed. Give one ounce fluid extract echinacea every three hours together with one dram hexamethylamine.]

OPEN AIR SILO CHUTE.

[Written for Pacific Rural Press.]

A common silo chute is too hot for G. V. Rude and his men in Imperial county. So he has had a galvanized hopper made 3 feet square at the top, tapering to a pipe nearly a foot in diameter and a couple of feet long. Two hooks on the side of the hopper hang over the door sills of the silo. Enough three-foot joints of pipe were made to reach the ground from the top of the silo, tapering each from about 12 inches diameter at the top end to 11 inches at the bottom.

On opposite sides of each joint is a small chain about six inches long with a stiff wire three inches long as a cross bar at the end. Each cross bar passes through a hole near the top of the next lower joint. As the silo is emptied a joint at a time may easily be taken from this chute and the hopper moved down a little.

NOTICE!

Wishing to devote my whole time to other business, I have decided to sell out my

Shire Stallions at Cost

in order to dispose of them quickly. Included are the stallions which have been at the head of my stud for the last two seasons. All are sound and good stock horses.

I can also spare one pair of "in foal" mares and three stallion foals.

If you are in the market, do not miss this opportunity.

Henry Wheatley : Napa, Cal.

PEDIGREED HOLSTEIN BULL
$250.

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. Her present record is 21.09, made at four years old, but she can make around 25 lbs. with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O. daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service.

Write or come and see him.

Unsoundness and Faults in Horses.

[Written by Dr. H. B. Wintringham, Petaluma.]

I do not propose in this short article to cover all the conditions which condemn an animal in the eyes of a veterinarian, but to give the commoner conditions on which a buyer or breeder should condemn an animal. All buyers of animals should require a veterinarian's certificate of soundness before purchasing and be glad to pay his fee for such service. However, this fee can be saved by the buyer's condemnation of an animal for the faults I shall enumerate, and if the animal is free from these it is time enough to consult the veterinarian.

The old saying that a horse is as good as his legs has never been beaten for truth and is a rule for buying and breeding of the first importance.

The first requisite for examining an animal is to stand at a distance and examine him to get a general idea of his conformation. A long-legged horse with lots of daylight under him and whose barrel is narrow and tucked up will in every case be a hard keeper and is usually subject to colics. See that his legs are straight and support the weight evenly. This examination at a distance will often show up deformities which would be overlooked and also give an idea of the symmetry of the animal.

In examining the legs the following defects are fairly easy to note and are bad faults: Uneven growth of the hoofs, rough walls of the hoofs, dropped sole, flat feet, contracted feet, side bone in horses to be used at the trot, ring bone, contracted tendons, splints, spavin, and stringhalt. The gait should be free and elastic with the legs carried well under the body and not spraddling out in every direction. Coarse bones, coarse hocks and curbs are bad faults and should not be overlooked. In other words a horse's legs are what he depends on for his value and usefulness.

To determine the above, it will be necessary for the observer to have some knowledge of the normal appearance of the limbs. Any irregularities should be compared with the opposite limb. This is probably the simplest way to determine defects; compare one leg with the other. As a usual thing, one leg only is affected. Any hard lumps or growths would be brought out by this comparison.

Probably next in importance to his legs an animal's wind should be considered. Here any irregularities are almost certain to be shown up if the animal is given a good stiff drive with a load up hill. This treatment will show up such blemishes and faults as: heaves, broken wind and roaring. It will also test the animal for short windedness. Also whether the horse is a balker or a free puller.

The ability of the animal to digest his food and use it properly is determined by a short coupled body well let down in the flank. Manure passed in long shreads will show that there is something wrong with the mouth and teeth and such a condition will sooner or later set up intestinal trouble.

Compare one eye with the other and try to ascertain whether there is blindness present. Moon blindness is an incurable trouble and any other defect of the eyes should condemn an animal as a very suspicious symptom.

A rough staring coat not only denotes unthriftiness, but is often a symptom of many grave and incurable infectious diseases.

Pus or moisture discharged from any part of the body is serious, particularly in the region of the withers and along the top of the neck where any swelling may denote a fistula or poll evil.

Any of the foregoing should condemn an animal for work; many are amenable to treatment and some are hereditary, but all are serious faults both in the stud and in the harness.

EXPERIENCE WITH SUDAN GRASS.

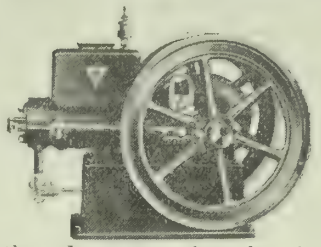
[Written for Pacific Rural Press.]

With so much interest being taken in Sudan grass the following communication from Geo. E. Johnson of Ripon brings out some information which should be of value. He says: "I planted six pounds of Sudan seed last spring and have fed the grass both green and matured to my horses, cows and sheep and it was relished by them all. The seed makes very good poultry feed.

"I have a cluster from one seed on exhibit at the San Diego Exposition that weighed 5.8 pounds in the green state and was eight feet high. From the six pounds of seed that I planted I harvested seven good loads of hay and then cut most of it only once, because I wanted a large seed crop, otherwise I might have cut it three times at least.

"Sudan grass does well on poor soil, also on dry upland. My seed was planted on very gravelly soil, without water and with only one cultivation.

"In the rush of work this season I ran out of alfalfa for my cow, so cut Sudan grass for about two weeks. I found very little difference in the amount of milk. Then I got some fresh alfalfa in shock and gave her some of that, but fed the young stock Sudan. This wouldn't work though, as old Bossy thought that Sudan tasted better, as it was sweet like sorghum.



"I think that for a man who has a piece of thin alfalfa, Sudan would be a 'bonanza.' Disked in, in the spring, it can be cut about every 30 days."

BORAGE AND RYE FOR FEEDING.

To the Editor: Can you tell me what borage, a medicinal plant, is good for? Can it be used as green fodder for chickens or other animals? Can rye be used as grain for chickens with Egyptian corn mixed? Is the same mixture good for hogs? —R. K., S. F.

[Borage (Borago officinalis) can surely be used for chicken feeding—also as forage for other animals. It is grown in Europe to boil for "greens" and to make salad of for human consumption. Rye is about as good as wheat for chickens. It is held to be not so good for pigs as corn and barley and should be fed as meal in a wet slop and not dry.—Editor.]

Measure an Engine's Worth BY ITS YEARS OF SERVICE

NOT FIRST COST ALONE, but the years of service it gives you determines whether or not an engine is expensive or economical. **YOU CAN BUY AN ENGINE** that costs less than the Alpha, but long years after the low-priced engine is consigned to the scrap heap, your Alpha engine will be giving you as dependable service as the day you bought it. **BECAUSE OF THIS DURABILITY** and absolute dependability

ALPHA ENGINES

Kerosene, Gasolene or Distillate

are recognized as the World's Standard.

THERE ARE MORE DROP FORGED PARTS on Alpha engines than any other. This means an engine as accurate in adjustment and therefore as economical after five or more years' constant use as when new.

PAYING FOR QUALITY at the start is far cheaper than paying for repairs and losses through delay every little while.

ALPHA ENGINES ARE DESIGNED to give the user real engine service. They are built up to a high standard, not down to a low price, yet **cost and service considered,** Alpha engines are the cheapest and most economical in the world.

DON'T TAKE OUR WORD for it, but ask any user of an Alpha engine anywhere and he will tell you as he tells us that the Alpha engine always satisfies.

MILES

Red Crown

the Gasoline of Quality

gives you more miles to the dollar. Carbureting qualities account for that—no waste of gas. Dealers everywhere and also at our many SERVICE STATIONS.

Standard Oil Company

(California)

What Does It Cost YOU to Feed Him?

In 1914, according to government reports, 497 California farmers saved on an average $220 each, by ridding their land of common ground squirrels.

What toll are these little rascals levying against you? Do you realize what damage even a few squirrels or gophers can do in a year's time?

Get rid of them. It's easily and quickly done with

KILMOL SQUIRLGOPHENE

Will Kill 'Em All

In each burrow put one waste ball saturated with Kilmol. After a few minutes, ignite. The deadly fumes instantly reach every nook and cranny of Mr. Squirrel's or Mr. Gopher's burrow. Kilmol gets him every time—poisons as well as asphyxiates. Kilmol costs you less than one cent per burrow, and one application does the business. Any other method requires from two to six times over at a much higher cost. Government, State and County officers use Kilmol and get 100% efficiency. Results absolutely guaranteed or money refunded.

Your local dealer can furnish waste balls better and cheaper than home-made. Ask him about Kilmol, and about new U. S. Government formula of poisoned barley.

Write for full information about squirrel and gopher eradication.

Herbert F. Dugan

Dept. B

1170 Sutter St. San Francisco

The United States Destructor, invented by U. S. officials and used with Kilmol. A machine that pumps the gas into the burrow.

BLACK LEG

LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen because they protect where other vaccines fail. Write for booklet and testimonials.

10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00

Use any injector, but Cutter's best.

The superiority of Cutter products is due to over 15 years of specializing in vaccines and serums only. Insist on Cutter's. If unobtainable, order direct.

THE CUTTER LABORATORY, Berkeley, California.

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

VALUE OF SKIM MILK.

To the Editor: Please tell me the value of sour skim milk as compared with commercial meat scrap. Can you supply me with a copy of your paper, issue of Aug. 21, 1915? —J. W. F., Petaluma.

[In Oct. 30, 1915, issue we replied to a similar query regarding the comparative feeding value of skim milk and meat scrap, in which we explained how to discover the relative worth of these two articles. With a basis of $3.50 per 100 pounds of beef scrap we demonstrated the value of 100 pounds of skim milk to be 25 cents. It may be well to repeat a statement made at that time, viz.: "Unless it is quite sweet it is well to make skim milk into cottage cheese and dispose of the whey as waste; several who have added the whey to the feed report bad results."

It is impossible to supply a copy of the issue of Aug. 21; in fact the supply of nearly all reserve copies of all dates for the past 18 months is exhausted. This is because of the recent remarkable growth of circulation coupled with the requests by many new subscribers to begin with issues dated prior to the time of subscribing.]

TRAPPING PIGEONS.

To the Editor: I have a surplus of pigeons flying at liberty and want to catch them to cull and sell those not wanted. I have been told to soak wheat in whisky or brandy but fear it might kill them. Please tell me what you think of this plan or advise some other means to trap them.—P. A., Lodi.

[The plan of soaking wheat with liquor is practiced by some but usually the time required to rig up some sort of equipment to use in connection with this plan is more trouble and expense than to entice the birds into a trap. Without certain conveniences our correspondent would probably develop into a circus actor by the time he had finished catching the birds. The liquor does not permanently injure the birds. A large trap is easily and quickly made by any one. Usually a few square feet of wire netting and a few strips of wood are all that is necessary. It may be made in so many ways, shapes and sizes an attempt to describe any particular plan would probably be confusing. Just arrange it so the pigeons can go into it through an opening, we will say, about a foot square. If made so that the pigeons, when once inside, cannot easily escape through it all the better, but some means of closing it readily must be provided to insure keeping them in when it is time to catch them. In this enclosure put a pan or shallow box in which place a thin layer of a mixture of cumin seed, aniseed and coriander seed. Bruise the seed to create the strong aromatic odor which is so extraordinarily enticing to pigeons. They are simply crazy for it.]

POULTRY INSECT POWDER.

To the Editor: Please send formula for good insect powder to kill chicken lice.—F. E. W., Byron.

[One of the best combinations for a poultry lice powder is as follows: 70 per cent finely powdered tobacco, 10 per cent flowers of sulphur, 10 per cent powdered napthalene, and 10 per cent powdered lime.

The following is a formula that appears in "California Poultry Practice": 4½ pounds plaster of paris, 1 quart gasoline, ½ pint commercial cresol, and ½ pound flaxseed meal.

Mix gasoline and cresol together, then mix in all the plaster of Paris the liquid will absorb. Spread on boards or sheets of paper to dry; when dry mix in the flaxseed meal and store away in cans.]

HARDY TURKEYS WANTED.

To the Editor: We are raising the Bronze Turkeys here and our loss is enormous every season. Would the Narragansett or some other breed be better?—T. T. Yerrington, Nev.

[The Bronze variety of turkeys seems to thrive particularly well in Nevada when correctly bred and given reasonable care. There may be peculiar local conditions in this correspondent's neighborhood that are unfavorable for turkey raising, but it is more likely the trouble is due to inbreeding. It is absolutely necessary frequently to add new, vigorous blood to any flock of turkeys. The Narragansetts or some other variety might be better adapted to this inquirer's location, but we doubt if they would be better than the Bronze, particularly if they are turned out to forage, because it is considered the best variety of all for a large range.]

A POULTRY BOOK FOR SCHOOLS.

We have received from the publishers a copy of Twenty Lessons on Poultry, which is the title given by the American Poultry Association to the "poultry primer" that is intended for use as a text book in the seventh and eighth grades of schools and in boys and girls' clubs.

Some months ago, when we learned that this elementary treatise on poultry culture was to be compiled by C. T. Patterson, we anticipated that this would be an interesting as well as a thoroughly practical educational book, and we have not been disappointed. Because of the simple and direct—and we might say homely—methods adopted by Prof. Patterson in all of his teachings, we consider him the most practical educator in poultry culture in America. This applies to both utility and standard breeding for the reason that he advocates the breeding of utility fowls along standard lines and condemns the breeding of standard fowls for fancy points only.

This book is cloth bound, containing 92 pages, size 5x7 inches, illustrated with 55 engravings. There is an interesting appendix in which are suggestions for the organization and work of boys and girls' poultry clubs, contests, and fairs. Publishers, J. B. Lippincott Co., Philadelphia. Price 50 cents net.

The Hayward Poultry Producers' Ass'n have purchased the lot adjoining their new warehouse on B St. and have moved onto it the better part of their old warehouse to be used as an egg receiving depot. This Association is also amending its present by-laws to more fully meet present conditions.

Screw down the grease cups and refill them at least twice a day when using tractor.

POULTRY NEWS NOTES.

Meat in some form must be fed to laying hens if they are to do their best as producers of eggs for market purposes; an exclusively vegetarian diet greatly reduces the production of eggs, so says Prof. E. J. Dougherty of the University of California.

The Pasadena poultry show offered five $50 silver cups, three of which were won by J. D. Klepper as follows: first, for best bird in the show; second, for best bird in the American class; and fourth, for best cockerel in Plymouth Rock class.

A recent examination of over 100 gizzards from fowls supposed to have died from cholera contained no grit of any sort. In each case diarrhoea existed several days before death. The examination proved conclusively that indigestion alone was responsible for the trouble.

The Glendale Poultry show, held Dec. 9-11, was judged by nine judges who placed the awards, among the 500 fowls in the show room, between 10 a. m. and 1 p. m. of the first day. No admission fee was charged.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

HOW TO RAISE DUCKS.

Duck eggs will hatch in an incubator, under a hen, under turkeys or under ducks themselves with almost universal success if the moisture question is looked after.

But this question is the rock on which so many people stumble that it cannot be looked on as of no consequence. In the first place a person must try to use some reason, not take it for granted that because duck eggs need moisture they should be hatched in a river. A man wrote me last summer that he hatched his ducks out in 24 days. Well, the reason was plain enough, but he could not see it until I told him, "too much moisture and too much heat."

The extremes had developed the embryo until it matured beyond the bounds of the shell and they hatched, but gave up the ghost immediately. Now, when a wild duck sets she makes her nest on the ground, among tall grass or weeds, in fact as secluded a place as she can find, so that when she is off the nest the eggs are concealed from birds of prey; and in doing this she accomplishes two other things: the eggs are on the moist earth and in the dark as near as she can get them, but, mind you, although her nest is near water it is not in it. The first few days she stays close and does not go swimming; she keeps her eggs warm, still and dark. Here is our first clue towards successful duck hatching. After the first few days she takes a short feeding time and a dip, shakes the water from her feathers and goes back to the nest. Now as the embryo grows in size she leaves the nest longer each day, giving the eggs plenty of time to cool off. This is the secret in hatching livable ducks, not too much heat, proper moisture and plenty of time to air.

Moisture by Weeks.—The first week give no moisture at all, the second week sprinkle lightly three times, third week sprinkle a little heavier four times and the fourth week sprinkle every day just lightly before you put them back into the incubator. Run the heat from 102 the first week gradually up to 103 as the time goes on and at hatching time they will stand at 104. You may have to help some of the ducklings out of the shell, give air while they are hatching, if they appear to suffer, but keep the heat up.

Now after hatching duck eggs in an incubator it must be thoroughly sprayed and deodorized before putting hen eggs in it and the door left open several days to air.

After Hatching.—When the hatch is off, keep them 24 hours without food or water, then feed lightly of rolled oats and bread crumbs soaked in milk. Serve a dish of water with a deep saucer, but not in anything they can get into with their feet, and be careful the chill is taken from the water.

After three days it will be all right to serve a mash composed of two parts corn meal, one part wheat bran, one part shorts and one part rolled oats during the first two weeks. After this time the oats can be omitted and bran added. Always serve coarse sand or very fine ground shell in the mash, which must be moistened but not wet. If the ducks are for market feed as high as 20 per cent beef scrap in the mash and increase the corn meal. Towards the end of the tenth week they should be ready, or nearly so, for market. That is the time to sell; never carry them beyond eleven weeks if they are intended for market because after that time they will molt their first fea hers and lose flesh. Pekin ducks or Mallard are the most profitable of all for this coast, if a market duck is wanted. The Indian Runner is a good laying duck, but is a little small for market ducks, though of course plenty of them are sold and I do not know of any objections to them as a table duck, other than the size.

RAISING HEAVY BREED CHICKS.

We are now coming to the large breeds of chicks, and while properly speaking, all chicks may be treated alike in regard to comfort, cleanliness and other generalities, there must be a difference in feed if we expect to get the best results.

In raising birds for size the first thing is to make the bone, as that is the foundation. A chicken with small bone and light frame cannot stand to put on much flesh. Their legs get weak and wobbly and they get over fat so that they lay very few eggs. This is true of all the large breeds.

Best Feeds.—So the first thing to remember is the bone structure and the very best feeds I know of for this are oats, wheat bran and cracked wheat. I feed rolled or steel cut oats from the start every two hours. Then I feed sprouted oats several times a day as the chicks grow older and in the dry mash I use plenty of fine, ground bone, steel cut oats, wheat bran, ground barley and when chicks are two months old replace the steel cut oats with oats ground with the hulls on. I don't use corn of any kind, and if milk can be had very little beef scrap; but if no milk can be had, give from five to ten per cent meat meal or beef scrap in dry mash.

Of course if the cockerels were intended for broilers I would add corn meal to the mash, but not for breeding stock. If these rules are adhered to, you will have big, fine frames, good strong legs and plenty of room for a good supply of meat.

Other green feed besides the sprouted oats may be given, as all grasses are good and the mineral from them is a bone builder. Too much stress cannot be made of the value of skim milk in the raising of strong, sturdy chicks. It pays to buy it if you can get it, in preference to beef scrap.

As a result of the increasing demand brought to California breeders of purebred poultry through the publicity gained by them at the Panama-Pacific Poultry Show, quite a number have sold every surplus bird and have booked egg orders up to the limit of production. In a letter just received, one of the exhibitors writes in substance: "My present Standard stock is entirely sold and we cannot supply the demand for utility birds, while egg orders exceed the supply. When conditions permit, I intend to place an advertisement in the Pacific Rural Press."

At the Indiana Experiment Station a test of several pens gave the following average production of eggs per hen: Those supplied skim milk, 135 plus eggs; those fed meat scrap, 135 eggs; and the pens receiving no meat or milk produced only 32½ eggs.

Poultry Breeders Directory

GET YOUR DAY-OLD CHIX FROM ACTUAL PRODUCERS, who know what they have and who can stand back of their chicks. We are utility poultry raisers and our White Leghorn chicks this year are from pen of 635 that averaged 171.2 eggs each last year. Our Rhode Island Reds are also heavy winter producers. Owing to superior transportation facilities in Sacramento, quick delivery is assured. White Leghorn chicks, $12.50 per 100; Rhode Island Reds, $15 per 100. Book at once. Brooke Farm, 807 J St., Sacramento.

RHODE ISLAND RED ANNOUNCEMENT.—Remember that February chicks are what you want for early high-priced broilers, and R. I. Reds are what we recommend for February. The pullets make fine winter layers. We will have lots of them, but order early, as the demand for our sturdy little youngsters is heavy. We are booking orders now for delivery any time to suit you. Write now, the earlier the better. Free circular. Campbell Poultry Ranch, Campbell, Calif.

WE OFFER 10,000 R. I. RED CHICKS during Feb'y at $12.50 per 100. Lots of 1000 or more at $12. Also 4500 Barred Rock chicks at same price. 8000 White Leghorn chicks at $10 per 100, or $90 per 1000. All of these are pure-bred high-class stock. These prices are special to secure early orders. Write us your wants today. Free 65-page catalog. Pioneer Hatchery Co., 620 S. Spring St., Los Angeles, Cal.

BABY CHICKS—All sturdy youngsters from good stock and hatched right. Rhode Island Reds. Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Orders booked now for delivery any time to suit you. Campbell Poultry Ranch, Campbell, Cal.

STIRLING FARM—Place your order now for eggs and chicks from Stirling Layers. Utility Leghorns exclusively. Our pure-bred tested layers are bred for size, vigor, quality and heavy-egg production. Send for descriptive circular and prices. Route 2, Box 1416, Sacramento, Cal.

WELL HATCHED AND STRONG day-old chicks from healthy vigorous breeders. White and Brown Leghorns per 100 February, $11, March $10, April $9. Reduction in quantities. Let us send you our announcement. San Jose Hatchery, 373 Meridian Road, San Jose, Cal. **Chicks well hatched are half-raised.**

MACFARLANE STRAIN WHITE LEGHORN eggs, $1.50 per 15, $2.50 per 20, $5.00 per 100; chicks Dec., Jan., Feb., 12c each, afterward 10c. Order now, any quantity. Cockerels, $2.50. Big plant, low prices, stock better than ever. Catalogue free, correspondence solicited. Newton Poultry Farm, Dept. 1, Los Gatos, Cal.

MODEL POULTRY FARM—White Leghorn Specialists. We are now booking orders for Hatching Eggs. Baby Chicks and 10 weeks' old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired **Heavy Winter Layers.** W. C. Smith, Prop., Corning, Cal.

MAKE BIG MONEY with our White Orpingtons. Best breed for every need. Lay most when prices highest; make finest eating; return greatest profit. 1000 grand range-raised birds, trap-nested and bred for heavy laying. Eggs, chicks, stock. Prices reasonable. Catalog free. Whitten Ranch, R. D. 5, Box 647, Los Angeles.

5-A EQUIPPED CHICKEN RANCH—Any amount water, one-half mile from Livermore. Less than $3000. E. P., care Rural Press.

BLACK MINORCA, R. I. Red, Buff Orpington Cockerels. Eggs for hatching Mrs. R. A. Holdridge, P. O. Box 282, Dixon, Cal.

RHODE ISLAND RED BABY CHICKS and Eggs. Heavy laying strain. Send for circular. Rosedale Ranch, R. 1, Hayward, Cal.

TRAPNESTED LEGHORNS—White and Buff Stock. Eggs, chickens. Arthur R. Schroeder, Box 179R, Mountain View, Cal.

BUFF ORPINGTONS—Utility winners Exposition. Runner Ducks, Eggs, Stock. Glendale, Fleming Ave., San Jose, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, PEA FOWL. Address Wm. A. French, 545 W. Park St., Stockton, Cal.

S. C. RHODE ISLAND REDS—Hatching eggs, Baby chicks and cockerels. Mrs V. P. Hewitt, Dixon, Cal.

SINGLE COMB Rhode Island Reds. Eggs and stock for sale. Dirk Dairy Farm, Lemoore, Cal.

HARES AND RABBITS.

LEADING RABBITRY IN AMERICA—Flemish Giants and New Zealands. Cut your living expenses. Catalogue free. Empire Rabbitry, Empire, Cal.

BELGIAN HARES—Young stock for sale. Hurd Bros. St. Helena, Cal.

TURKEYS, DUCKS AND GEESE.

BOURBON RED TURKEYS and eggs for hatching. My birds won all the honors in the Alameda County Poultry Exhibition in Oakland, 1914. Just as fine this year A. E. Balmer, Alhambra Valley, Martinez, Cal.

WHITE PEKIN DUCKS—Heavy layers, heavy table-fowls, rapid growers. Eggs, $1.00 per dozen; $5.00 per hundred. Baby ducks, $18.00 per hundred. **PEKIN DUCK FARM, Santa Cruz, Cal**

MAMMOTH BRONZE TURKEYS—THE BEST IN THE WEST—Extra special prices. Further information cheerfully given. Write now to secure best birds. Geo. A. Smith, Corcoran, Cal.

WANTED FOR COMMERCIAL HATCHERY—Bronze Turkey eggs, Pekin duck eggs and goose eggs. No fancy prices. Address Stag's Leap Ranch, Yountville, Cal.

HART'S BRONZE TURKEYS—Vigorous young stock. Eggs by the setting or incubator lots. Circulars free. Albert M. Hart, Clements, Cal.

FOR SALE—One pen of China Pheasants, one male and five females. L. R. McCoy, R. I, Box 205 Stockton, Cal.

PHEASANTS—Golden and Ringneck. Eggs from April on. T. D. Morris, Agua Caliente, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S BULLETIN.

My dear Friends: This is always the time of year when any woman wishes she were, if just for a day, a dress model or mannikin, so that she could try on all of the lovely novelties of the modiste's art for the season of spring, and see herself in them. Anyone having this entertaining experience with the present year's styles will certainly remember herself as a kaleidoscope.

This is also the time of year, I ought to add,

When poets from a theme sublime
Turn, and start to do
The annual crime of comic rhyme
Anent the "peek-a-boo"!

And there will be plenty of peek-a-boo materials in blouses and neck fixings.

By the way, rather transparent blouses of crepe de chine in solid tints are on display. And very refined and dignified I call them too, for all their rainbow hues. The front is generally pleated, making a soft yet shapely effect. In some I saw three buttons on the shoulders epaulette fashion, a most fetching decorative use of buttons. The crtical mind soon gets used to them, from seeing buttons nowadays in use so much where they aren't of any.

There's a perfectly daring employment of wide white borders on some sport skirts of the more pronounced types. To the practical this seems to be putting white where it is most easily soiled, but the idea is none the less picturesque.

In hats, the wing effects and stick-ups are put forward quite confidently. Some of the hats are very simple and elegant, and others are very elegant, not at all simple, but decorated with a mass of flowers or fruits.

Those corduroy negligees, rose colored or pink, that put a dash of the exotic into a boudoir, are now around $5, $10, $15—according to the grade.

Among the new things is jet jewelry, mostly in necklaces. Saw one necklace of jet and amber beads alternating, that looked good to me. Some of the designs have very large beads indeed—an inch in diameter. What struck me as most elegant was a one-piece plain jet bracelet in what I would describe as a Tiffany pattern. If jet is to be a vogue, there is no cause for alarm, since it is not dear—being, very roughly speaking, priced somewhere around $6 a pound. Or at least, so it seems to me.

Hist! here's an advance tip on something that is on the way for the athletic sister. 'Tis a new tennis blouse of white linen with little knickers to it for wearing under the skirt so that the blouse can't pull out of the waistband when the arm swings the swatting racquet.

Ah well, it seems that the sex secretly isn't resigned to being athletic until the blouse behaves. By the same token a man wouldn't feel at home on a baseball nine except in a stiff-bosom shirt.

Am I right? Devotedly,

ROSABELLA BEST.

(Note—Readers wishing information from Mrs Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

MELT-IN-YOUR-MOUTH MARSHMALLOW PUDDING.

(This Week's Preferred Recipe.)

1 tablsp. gelatine soaked in ½ cup cold water for 10 minutes; then fill cup with boiling water.

3 whites of eggs, 1 cup sugar (scant) 1 teasp. vanilla.

Beat egg whites, then fold in the sugar, then geat in the gelatine and vannilla. Coloring matter may now be added to suit. The beating may take 20 nimutes.

This puding may be elaborated by putting chopped nut meats into it.

RECUPERATION.

This is a warning in behalf of warm homes. (Not warm bedrooms, unless they are used as sitting rooms—which they ought not to be.)

Warmth in the home is neglected too much on this coast in chilly evenings or in wet weather. It is particularly unhealthy to SIT in a cold, damp room full of dead, still air.

It is all right to have the house unwarmed while everybody in it is up and about and working. But every evening for a few hours before bedtime, when everyone relaxes, the sitting room ought to be perfectly comfortable. During this time the body will either recuperate from the day's battle with cold or it will lose more of its vitality. Let it recuperate.

This advice is particularly important as regards persons of the household who are away during the day at more or less inactive asks in schools, shops or offices, that are below par in comfort, which is too often the case. Natural resistance to these unfavorable conditions is gradually broken down if there is not a period of comfort for a few hours, and colds will result. People who are at outdoor, active tasks during the day are—strange as it may seem—better able to survive discomfort after and during working hours than those who are engaged in the so-called "sheltered" vocations. One is not sheltered by a roof over one's head if one feels chilled and miserable.

EXPERIENCE EXCHANGE.

A good tomato soup is sent in by A. M., Riverside: Pour can of tomatoes into saucepan, and a cup of oatmeal, small onion, a few pieces of celery and 3 pints water. This should boil slowly for two hours. Then strain and add a pinch of baking soda and a lump of butter, a teasp. sugar, and boil slowly twenty minutes longer.

This does not come under the head of experience, but since a reader asks, we leave it to the others to answer. The question is: Why is it that an undressed boy is a boy with his clothes off, while an undressed turkey is a turkey with its clothes on?

MILLINERY MODES.

Large black satin sailor shapes have facing of flesh colored satin; aigrettes are favored as mounts.

Glace effects are being shown even in the straws.

Flowers, foliage, ribbon and fruits have highly polished surfaces.

A NEW RICE DAINTY.

There was a Japanese at the San Francisco Exposition with something new in rice cookery.

The raw product consisted of chips of dried rice paste, hard and brittle. These he cooked, while you waited, by dropping them in boiling oil. As you watched, the flakes puffed up—became light and porous. They became crisp cakes, to be eaten while hot, and they were slightly sweetened and flavored with oil of lemon. Altogether they were delicious. They could also be cooked by placing in a bake oven, where they rose into the same light cakes.

The Japanese, who could speak excellent English, said the flakes were made of a special kind of rice unusually rich in gluten. It was ground, mixed with water and the dough, after drying in the air, was then sliced into thin flakes. These flakes were then desiccated on pans over a slow charcoal fire until perfectly dry, when they were ready for storage or export.

For cooking them in oil he used either cocoanut oil or olive oil. For these cakes a little of the oil would go a far way because the cakes do not absorb any of the oil and are just browned by it. But the oil must be very hot, and to be very hot a large quantity must be heated at a time, as only a large quantity of it will properly hold the heat without smoking and waste. The flakes cooked in oil generally lose all of the lemon flavor, because the flavor is so volatile. In the baked flakes, however, the flavor was well retained.

In the opinion of the writer, who tried them cooked both ways, they are preferable without the lemon flavor.

The Japanese said the puffed effect upon the rice paste was similar to that produced in popping corn.

The time will probably come when this form of rice food will be better known in this country, because it seems meritorious.

THIS WEEK'S BEST HOUSEHOLD HELP.

To keep the tots neat and clean at least cost, time and trouble—get them the blue jeans overalls or coveralls; these can be ready-made or homemade. It is as cheap to buy them as make them, and the time is saved as well. Once tried, a garment like this will be discarded with reluctance both by the mother and the wearer.

Cheese is extremely more digestible cooked than uncooked.

BANISH THE GLOOMS.

By Sunbonnet Sue.

Why do I smile when others look glum? Why do I beam through the day?

My thoughts are of things that are wholesome; my mind is not sick with ill-nature.

As is my mind so is my countenance; it reflects like a mirror my inward mood.

I am but human. I am ambushed by glooms, and the doldrums beset me. But I do not rise up to welcome them. I shun them.

For such is my argument, the way of my reasoning: If I can direct my footsteps to take me whither I list, I do not have to follow them in paths I abhor.

Then of my thoughts shall I also be master; and they shall turn to the light and the sunshine and not to the shadow and gloom.

In this way I shall have content in my heart, even though age be upon me.

I turn the course of my mind from the paths full of pain till I tread the aisle of good humor.

And this is my secret of bliss.

Berkeley, Cal.

WHY CHILDREN LIE.

In an interesting address recently, Mrs. John Woods Beckman discussed, before the Child Welfare Study Club of Berkeley, the subject of falsehoods among young children, answering the question, "Does a child of two or three years old tell lies?" Her belief is that youngsters of that age do not deliberately tell untruths; it is more likely that their imaginations are running riot.

A point Mrs. Beckman emphasized is that it is dangerous to mold the plastic natures of young children by fibbing to them ourselves. Untruths, however immaterial, told before children who do not understand the emergencies of polite usage, may start them on a career of fibbing that can not easily be checked. But the most enlightening of her suggestions was that an unnatural strain is put upon the character of the very young if we demand direct answers concerning some fault or mischief, constituting a kind of parental "third degree." Here the tendency of the child, through fear, not depravity, is to evade a confession and invent a false answer. Until the child is farther advanced in years and training, indirect, tactful questioning to learn the desired facts is advocated. And correction when needed should be in the form of proper reasoning to make a repetition of the offense seem undesirable.

THE EMBROIDERY MANIA.

From napkins the embroidery fad has passed on to the lunch cloths. Bright colors of course are the thing, something to match the set of napkins you have just finished.

The borders of the lunch cloths receive this embroidery treatment, the centers being left blank. Sometimes lace insertion of Russian or Italian thread is used to bar off the border from the center, while the edges of the cloth are hemstitched.

NEVER SATISFIED.

"I want to be a chrysalis,"
The caterpillar cried;
But when a chrysalis he was,
For something else he sighed.

"I want to be a butterfly,"
He dreamily lamented:
But when he got his wings and flew,
He still was discontented.

For when a shower came on he sobbed
In unprotected grief,
I want to be a grub again,
Beneath a cabbage leaf!"

—Cincinnati Enquirer.

WHERE STANLEY FOUND LIVINGSTONE.

To many of little more than middle age it seems only a few years ago that Henry M. Stanley came out of the African wilderness with the message that thrilled the world: "I have found Livingstone."

For years David Livingstone, the missionary-explorer, had been lost in the heart of the dark continent. Then two newspapers sent Stanley to find him, and for months he, too, was lost, and the whole world waited. And the news came at last that Stanley had found Livingstone living with his negro converts at Ujiji, on the banks of that mysterious Lake Tanganyika. You remember the picture of the two men meeting there in the wilderness. Stanley, the young American newspaper correspondent, stalwart, upstanding, springy of step—Livingstone aged, broken, a faded old army cap in his trembling hand as the two advanced to meet each other.

How far away that seemed then. How oddly sounded the new names of places, unheard of before, which Stanley brought with him out of that mysterious, unknown land.

And yet it was only forty-five years ago that Stanley found Livingstone. Only four years previous Livingstone discovered Lake Tanganyiki. Only forty-nine years have elapsed since the first white man gazed upon that vast sheet of water. And here, in the news dispatches since New Year's, was an account of a naval encounter upon Lake Tanganyika between British and German forces. Germany and Britain have colonies that border the lake and they are disputing there upon that lake and around its shores. Fifty years ago it was unknown to the civilized world.

Another news item recently told that a daughter of David Livingstone had just returned from a visit to the spot in Africa where Livingstone's heart was buried. He died among the negroes of the interior of Africa in 1873 and two of his negro converts to Christianity buried his heart beneath a tree on the bank of Lake Bangweolo and carried his body to the coast from whence it was conveyed to England and buried in Westminster Abbey. But the heart remained in the wilderness, and twenty-five years passed before a white man found the spot where it lay beneath a great mpundu tree.

The spot is marked by a concrete monument with a bronze inscription, and a cottage stands near, in which was a book which the account says "contained the names of a large number of travelers and adventurers from all corners of the earth." The daughter of the great explorer found that the monument had been disfigured by relic hunters, and the bronze slab carried off by a savage chief, and the book of signatures had been stolen. She made an appeal to the press of England for money to replace the monument and inscription and try to recover the book of signatures.

The amazing thing is that this spot, which twenty-five years ago was in the heart of Darkest Africa, is now on a well beaten path of civilization. How fast the prophecies are coming true:

"For the earth shall be full of the knowledge of the Lord, as the waters cover the sea," and "The wilderness and the solitary places shall be glad for them; and the desert shall rejoice; and blossom as the rose."—Kansas City Star.

THE HUMAN HEART'S JOB.

Dr. J. Strickland Goodall illustrates the enormous power of the human heart in a striking way:

Take a 2-pound weight in the palm of the hand, resting the elbow upon a table, and raise and lower it from the level of the elbow to the shoulder. This is exactly the work done by the heart at each beat. Do this seventy or eighty times a minute and see how long you can keep it up. At each contraction the heart does enough work to lift a 2-pound weight one foot. The heart of a young and hearthy person is almost immune to weariness or strain. But if its muscles be weakened by the accumulation of body poisons or by anemia, it is very easily strained. The heart has been known to break from the strain of sudden emotion. Anger will increase the work of the heart from 152 to 224 foot-pounds a minute. Therefore, "Keep your temper" is good physiological advice.

Running to catch a train, running upstairs, or any sudden and unusual exertion puts a great strain upon the heart. The healthy heart of youth is equal to such strains; not so the heart that has been weakened by dissipation or old age. Doctor Goodall tested the heart of a healthy man before he ran to catch a train; it was beating seventy-six to the minute and doing 152 foot-pounds of work a minute. He tested it immediately after the run; it was beating 180 to the minute and doing 360 foot-pounds of work a minute.

SCARLET FEVER.

Scarlet fever is one of the most dangerous diseases. It is communicated by personal contact, by infected articles such as clothing, rags, hair, paper, or discharges from an affected person.

The discharges from the skin, throat, nose and mouth are extremely dangerous, and those from the eyes, ears, kidneys and bowels are also dangerous.

During the scaling of the skin period, which sometimes lasts for 70 or 80 days, the disease is believed to be most communicable.

Scarlet fever is fatal mostly to children under 10 years of age. Since mild forms of the disease in adults may and frequently do communicate fatal forms of the disease to children, the isolation of those even mildly sick with, and convalescent from, scarlet fever is important.

Another important thing to remember is not to let a dog, cat or any other animal that has been in contact with a case of scarlet fever go near a child. No cat or dog should even be permitted to enter the sick room.

BUSY NON-PARTICIPANT.

In every age there comes to view
The man who speaks in lofty tone,
And tells the others what to do,
But finds no task to make his own.

—Farming Business.

Demonstrated. — "Mother," called Johnnie, "these trousers that you made me are too tight." "Oh, no, they're not, Johnny," answered his mother. "They are so, Mother. They're tighter than my own skin." "Now, Johnny, you know better than that." "It is so, Mother. I can sit down in my skin and I can't sit down in these trousers."

One Instalment.—"Is this piano yours?" "Oh, about an octave of it."—Boston Transcript.

A Wonderful Opportunity Awaits Every Home Furnisher in the Southwest

BARKER BROS. GREAT 36th Annual Clearance Sale

Important notice to those who live away from Los Angeles

—So many and so varied are the economies offered during this great sale, that you can well afford to come to Los Angeles specially to take advantage.

—The savings on furniture will average fully 15 to 25 per cent. from our regular low prices—on some articles a little less—on others even more. It is quickly apparent, therefore, that the savings on a purchase of any reasonable amount will easily cover the cost of coming to Los Angeles.

—For instance, in a general way, a purchase of $20 will save you enough to pay for a round trip of 50 miles—a purchase of $50 will save you enough to pay for a round trip of 150 miles; and these are minimum savings—on many articles the savings will be two or three times as much—and in some instances even more.

—In addition to the furniture offerings, the savings on many articles in our other home furnishing lines are also an important factor. This is an opportunity not likely to be duplicated. Take advantage of it.

Barker Bros
ESTABLISHED-1880

ONE OF THE LARGEST COMPLETE HOME FURNISHING HOUSES IN THE WORLD.

—If unable to visit Los Angeles, write us and let our Mail Order Dept. supply your wants from the special values in this sale.

724-738 South Broadway, Los Angeles

WE PAY THE FREIGHT WITHIN 100 MILES.

You won't mind a hard day's work if you can look forward to a restful sleep on a

Leggett Spring

The Leggett Spring is comfortable and sanitary to the highest degree. Is absolutely guaranteed not to break or sag. **Will last a lifetime.** At least a third of your lifetime is spent in bed.

House cleaning time is approaching. Better discard your old uncomfortable spring and put in a Leggett. If you will write us we will gladly tell you all about it.

Pacific Spring Bed Co., Berkeley, Calif.

The Farm Journal

143 Washington Square, Philadelphia

The Markets.

Unless otherwise noted, prices quoted are f. o. b. San Francisco.

San Francisco, Feb. 2, 1916.

WHEAT.

According to reports from the north, there is still a heavy stock of wheat on hand, owing to lack of ships. Sales have been rather heavy of late, however, and with increasing demands in the local market for both milling and lower grades the market is firm, with a further advance in some lines.

Cal. Club, ctl.	$1.80 @1.85
Northern Bluestem.	1.97½ @2.02½
Northern Club	1.85 @1.87½
Northern Red	1.85 @2.05

BARLEY.

The recent Eastern movement, together with a much more active local demand for feed, have brought about another slight advance, and the demand continues strong.

Shipping, ctl.	$1.40 @1.45
Choice Feed, ctl.	1.37½ @1.40

OATS.

All feed grades are quoted higher, partly in sympathy with barley, and partly owing to a larger demand, both locally and for shipment, export business being reported heavy in the East.

Red Feed	$1.35 @1.37½
Red Seed	1.45 @1.65
White	1.50 @1.55

CORN

Eastern yellow is strong, but no higher, the only change being a slight advance on Egyptian, which has been moving off well.

Eastern yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.65 @1.70
Egyptian	1.50 @1.55

BEANS.

The market still presents no feature of much interest, as the shipping demand continues very quiet for all varieties. Nearly everything is steadily held, and in some lines, with short supplies, values still tend upward; but in a number of lines there is a little easiness. Bayos this week are quoted slightly lower. Tepary beans are quoted, though sales in this market have been too small to establish very definite values, and only good stock would bring the price quoted.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.90 @5.00
Blackeyes	3.60 @3.70
Cranberry Beans	4.75 @4.85
Horse Beans	3.25 @3.50
Small Whites (south)	5.80 @5.90
Large Whites	5.75 @5.90
Pinks	4.30 @4.40
Limas (south)	4.50 @4.60
Red Kidney	6.50 @6.75
Mexican Reds	4.50 @4.65
Tepary Beans	4.00

RICE.

The Pacific Rice Growers' Association reports the market still quiet, with offers for finished rice below the views of sellers, though it is believed that a firm attitude on the part of growers will result in more satisfactory conditions. Mills are said to be working for lower prices on the rough grain, but it is very doubtful if a decline would stimulate the demand of any extent, and an exhibition of weakness might do more harm than good.

SEEDS.

There is considerable inquiry for alfalfa at present, and good clean stock is quoted at a slight advance, though inferior seed may be had somewhat cheaper.

Alfalfa, per lb.	19 @20 c
Melilous Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

Arrivals have been light for the last week, and the market has also been strengthened by a very heavy demand on this market from outside points, causing large withdrawals from local warehouses. An enormous quantity of hay is being fed all over the state, owing to storms and short grass, and the result is a very firm market for the cheaper grades, wild oats and stock hay and alfalfa all being quotably higher. The outlook is for a very strong market until the new crop appears.

No. 1 Wheat	$12.00 @15.00
No. 2	10.00 @11.50
Tame Oats	10.00 @16.50
Wild Oats	10.00 @12.50
Alfalfa	12.00 @15.00
Stock Hay	7.00 @11.00
Straw, per bale	.25 @ .40

FEEDSTUFFS.

Owing to the absence of green feed, and the export demand for grain, all lines are quite firm and move well. Bran, middlings and rolled barley are all higher in sympathy with grain, and best pulp has also advanced.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.00
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal per ton	21.00 @22.00
Bran, per ton	26.00 @27.00
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	39.50 @40.50
Middlings	33.00 @34.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

The heavy storms and cold weather have done enormous damage to vegetable crops nearly everywhere, and prices generally are higher, with very light supplies coming in, even poor stuff being rather firm. Even local vegetables are coming in slowly, and Southern goods are scarce and poor. Cabbage, cauliflower and sprouts are all advanced sharply, and peas and beans were out of the market for several days. Peppers and eggplant are very scarce, and southern tomatoes are higher. Fancy celery is held at extreme prices, and lettuce is very firm, though better arrivals from Sacramento have relieved the shortage, preparations are under way for the asparagus season.

Cabbage, ctl.	40 @50 c
Cauliflower, doz.	.50 @1.00
Sprouts, lb.	4 @5 c
Rhubarb, box	1.25 @1.50
Srawberry Rhubarb	1.75 @2.00
Peas, southern, lb.	10 @12 c
String Beans	8 @10 c
Peppers, bell, lb.	15 @25 c
Tomatoes, L. A., crate	1.75 @2.50
Eggplant, lb.	8 @10 c
Celery, crate	3.00 @4.50
Artichokes, doz.	.50 @1.00
Lettuce, small, crate	1.00 @1.50

POTATOES AND ONIONS.

River potatoes are hardly as high as last week, but offerings are light and closely held. Oregon and other fancy offerings are very firm, and values are well maintained on onions from all sources, as the available supply is very light.

(On Wharf.)

Oregon Burbanks	$1.60 @1.85
Salinas Burbanks	2.00 @2.10
Delta Burbanks	$1.10 @1.65
Sweet Potatoes, ctl.	1.35 @1.90
Onions, Delta, ctl.	1.85 @2.25
Oregon	2.00 @2.50
Garlic, per lb.	10 @12½c

POULTRY.

Turkeys are getting scarce, and live birds are quoted higher. Old hens are now coming in quite freely, and with limited demand prices are inclined to easiness. Young chickens, however, still clean up readily, and young broilers and roosters are a little higher.

Turkeys, dressed	24 @30c
Live Turkeys, lb.	22 @23c
Broilers, 15 lbs. to doz. and less, lb.	32 @35c
do, over 15 lbs. to doz.	23 @25c
Fryers	22 @24c
Hens, extra, per lb.	17 @19c
Small	17 @18c
Smooth Young Roosters, per lb.	19 @20c
Squabs, per doz.	2.00 @4.00
Geese, per pair	2.25 @3.00
Ducks, young, lb.	18 @19c
Old	14 @15c
Belgian Hares	9 @11c

McFarland, Cal., Jan. 28, 1916.

Pacific Rural Press:

The ad. I had you put in your paper in December has brought me more orders than I can fill, so kindly discontinue it for the present and send bill. I assure you that any time I have anything to advertise, your paper will be the medium I will use.—T. M.Calvert.

BUTTER.

The storms in the south and cold and wet in the north have tended to curtail supplies, and the Los Angeles market advanced sharply. This naturally stiffened the local values, and the increased demand has enabled storage operators to move a good deal of stock.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	28½	29	30	30½	30	30
Prime Firsts	27½	28	29½	29½	29½	29½
Firsts	26	26½	27	27	27	27

EGGS.

Bad weather at the end of last week caused the upward movement, with very light arrivals; but the high level of the previous week was not reached, and now the market is dropping again, though much higher than last year. Quite a bit of Eastern storage stock has come in lately.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	33½	35½	37	36	33½	33½
Sel. Pullets	31	33	36	35½	32½	32½

CHEESE.

There is very little demand at the moment, though with light offerings prices are well maintained. Larger supplies of Monterey cheese are expected shortly.

Y. A.'s, fancy	17½c
Fancy Calif. flats, per lb.	17 c
Monterey Cheese	17 @18c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	29	32	34	32	32	32
Eggs	35	35	40	44	44	35

DECIDUOUS FRUITS.

Local apple prices show no quotable change, but the local movement has been better for the past week than for some time previous, and stocks here are not unwieldy. Nothing else in this line is offered.

Apples, Cal. Newtown	$ .75 @1.25
Pearmain	.65 @1.00
Greening	.65 @1.00
Baldwin	.75 @1.25
Oregon Spitzenbergs	1.50 @2.50
Jonathan	1.25 @1.75

DRIED FRUITS.

The dried fruit market continues in the old rut, with little change in prices, no very urgent demand from any quarter in most lines, and hardly enough fruit offered in the country to establish a market, according to local packers. Peaches are the only article to show any weakness, and they are in much better shape than a few months ago, as there is no great amount left in the state. There is scarcely any demand from the East, however, and packers regard purchases at present as a favor to the seller more than anything else. Accordingly nothing much can be expected in the way of prices, and 5c. would be about the top figure for the best offerings if urged for sale now, while any ordinary lots would have to go much cheaper. In view of the shortage in other lines, this fruit should pick up later on, but the packers are making no predictions. Apples are steady, with very little business, but no pressure to sell; apricots and figs are all cleaned up, and prunes are closely held, with a fair and growing demand. The New York Journal of Commerce says:

"Prunes for future shipment are irregular. Some of the smaller packers show a tendency to cut prices a trifle below the quotations that were being named by the more prominent operators.

In spite of the tendency, the larger packers who are said to be in control of by far the larger share of stocks are holding a very strong tendency and making no effort to meet the low level.

Coast Apricots and Peaches continue firm with only light buying in progress for future shipment. Prices show no quotable change and stocks are said to be gradually cleaning up. Spot conditions are quiet, with moderate sized quantities in evidence and a light demand. Prices are generally held firm in all quarters."

CITRUS FRUITS.

Oranges and grapefruit have been moving much better in the San Francisco market since the weather cleared a little, and values are well maintained, but without any further advance. There is some talk, however, of still higher prices at shipping points.

Oranges are being held firmly, the prices in southern part of the State having been advanced slightly during the past week, the price now being $2.75 f. o. b.

At New York on Monday, Jan. 31st, navels averaged on auction from $2.60 to $3.60 per box; lemons averaged from $3.65 to $4.20. At Chicago the same day oranges averaged from $2.50 to $3.75; and lemons $3.50 to $4.10 per box.

Shipments of oranges from southern California for the season up to Jan. 29th, were 3057 cars, as against 3706 cars to same date last year, and of lemons 1267 cars as against 794 cars last year.

(Wholesale prices, San Francisco.)

Tangerines	1.50 @2.00
Grapefruit	1.75 @2.25
Lemons, box	1.50 @3.00

Special Live Stock Market Report.

The first receipts of livestock since the last blockade of the railroads arrived the early part of this week. It is probable that on this account receipts will be heavy for some time.

The dressed meat market shows a good deal of strength on cattle, particularly on light stuff. Heavy ones are not so much in demand and are not moving so freely. Dressed mutton is in strong demand and continues to be scarce, practically all of the supplies at this time coming from the Nevada, Utah and Idaho feed lots. The storm last week worked havoc with winter lambing in low sections, although the extent of this condition is not definitely known.

Hogs are again marked up this week, the dressed market being some stronger in sympathy with the packing demand. Shipments have been delayed on account of the storm some, but there is a general feeling of strength, both by packers and country holders. One buyer states that a lot of farmers are holding for eight cents.

WOOL.

There is considerable activity in wool of all kinds locally and prices are marked up as a result. Country holdings are pretty well cleaned up and those who still have wool on their hands have not got choice goods. Dealers are making quite heavy shipments east, presumably to be prepared to handle the spring clip which will begin arriving in a month or six weeks. The Boston market is holding firm, but the feeling is slightly easier in foreign markets, the belief being that the top has been reached.

Lemonettes, box ..... 1.25@1.75

HONEY.

There has been a little export movement in the last few weeks, and with local jobbers also out for supplies for the spring trade, the market is pretty well cleaned up and prices show a firm tendency.

Water White, comb	13@15 c
Amber	8@12 c
Water White, extracted ..	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

The Almond Exchange has withdrawn prices on 1915 nuts, and values are nominal, as there is nothing of any consequence left in the country. While there seems to be no urgent demand locally any good stock still available should be worth about the Exchange price here. The last crop is estimated at 3800 tons, of which 75 per cent was controlled by the Exchange, the crop being considered the largest in the history of the state. Many contracts subject to approval of prices for 1916 almonds are now coming to the Exchange from the interior of the country, notwithstanding the offer of certain packers to sell below the lowest price named by the Exchange, regardless of what it might be. In fact, it is believed that such tactics will ultimately tend to strengthen the growers' organization.

(Prices f. o. b. San Francisco.)

Almonds (1915)	Nominal
Walnuts (1915):	
Budded, per lb.	17½c
No. 1	14 c
No. 2	11 c
Jumbo	17 c

LIVE STOCK.

Hog prices again show several changes, prices being higher on all weights, with smaller arrivals, while the range is hardly so great between different weights. Sheep and lambs also are quite a bit higher, shipments to this market having been light, with prospects that they will not increase greatly for some time.

(Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, S. F.)

Steers, No. 1	6¾ @7 c
No. 2	6¼ @6½c

Tehama Co., free	13 @14 c

HORSES.

Offerings of horses in the local market in the last few weeks have been the largest in some time, and included some very fair assortments of desirable heavy stock. All the sales have been pretty well attended, and there has been some spirited bidding for the more desirable drafters, which always find a ready market. Prices for the heaviest horses are higher. Dealers say there is no demand here for horses under 1,000 pounds, and inferior animals, of which a good many have been sold by firms putting in motor vehicles, go for poor prices.

(Approximate values at San Francisco, based on auction sales.)

Drafters, 1700 lbs. and up	$250@300
Drafters, 1550 to 1650 ..	150@225
Chunks, 1350 to 1500 lbs.	150@175

Be sure to use the dust trap all the time. Drain the radiator and motor every night during cold weather.

Almond Growers

Again, the "cut any Association price" speculators are at work offering to cut the California Almond Growers' Exchange's lowest price on 1916 almonds.

In so doing these parties admit their inabiltity to sell to as good advantage as the Exchange.

California Almond Growers' Exchange

SAN FRANCISCO, CAL.

Publisher's Department

G. W. Harney of Marysville says that the two books by Prof. Wickson known as 1000 and 2d thousand Questions in California Agriculture Answered are as valuable as the Encyclopedia of Horticulture. Every farmer should have these books.

LETTER OF APPRECIATION.

Here is a letter in which the writer expresses his admiration for the Pacific Rural Press:

"Herewith my renewal to the Press. I would regret very much to be without it. I consider a five-year file of the Press of as great a value to a California fruit rancher as a course in an agriculture school; perhaps more so, for aside from agricultural topics, we get the benefits of discussion on other economics. Suggestions from your subscribers are of great value, also articles by your field men, of practice and results.

"I would rather pay five dollars a year for a paper whose columns are open to all and whose editor does not toady to the advertisers, than 50 cents for one whose editor wants to create all impressions to his point of view, and incidentally to his own advantage. Every page of every issue of the Press is of vital interest to the farmer. It is hard indeed to pick out any one feature that is of greater benefit than another, but Mr. B. Anderson's experience with thrips, as told in the January 15 issue, and other articles of kindred nature, are perhaps of the greatest immediate benefit. Your own work too, my dear editor, is of great value. You promote optimism; you urge us on; you even sometimes goad us on. You promote in us a tendency to try to read between the lines; yes and even read where there are no lines. Especially do you interest me when on some of those bright crisp mornings you get a strangle hold on your pencil, and proceed to speak right out in meeting. I like to read and hear plain talk, coming straight from the shoulder of an honest conviction; it seems to engender more confidence; it seems to infuse a resolution to greater endeavor. And now, my dear sir, I hope you will stand square and firm on all issues affecting agriculture in California, give not an inch; compromise with none; but hammer, hammer, hammer.

"Laurel. D. A. La Porte."

WANTED

ABOUT

20 Good Farmers

who have the "Pep," are tired of working for others, and wish to acquire land of their own. Land is in Tulare County, between Pixley and Spa, mostly graded and checked, and has been in Rice last year, producing from 30 to 40 sacks per acre. Also good for grain, fruits or alfalfa. Electric pumping plants, reservoirs, ditches and buildings. For rent on shares, or sale on crop basis, on long time and easy terms.

Address: R. C. Fairall, Pixley, Cal., or R. Schiffmann, owner, Chamber of Commerce Building, Pasadena, Cal.

SPRAY!

Make More Money

The man who doesn't spray is throwing away good money. The cost of a durable, *easy-working* Deming Sprayer is less than the increased profits the first year. Sprayed fruit gets the high price. Write today for our 32-page catalog showing over 25 types of sprayers.

DEMING SPRAY PUMPS

WON HIGHEST AWARD AT SAN FRANCISCO EXPOSITION

International Harvester Wagons—Weber—Columbus

WHEN your old wagon is just about gone and you're thinking of buying a new one, sit down and do a little figuring. What kind of service has that wagon given you? How many delays have you had because of accident and breakdowns? Could you always get repairs easily? How long has it lasted? You have to add all unnecessary expense to the price you paid at first, to find out what your wagon really cost you.

When you have these figures you will see at once the advantage of buying a **Columbus** or **Weber** wagon. They give you steady service, with no delays. You can get repairs any day you need them. The folding endgate and link end rods make them easy to load and unload. The fifth wheel—an exclusive feature on these wagons—adds years to their life.

When you are ready to buy a new wagon and want the one that costs the least per year of service, drop us a line. We will direct you to the nearest **Columbus** or **Weber** wagon dealer and give you information that will make it easy for you to buy one of the best wagons you ever owned.

Cows for Settlers on Subdivision Tracts.

[Written for Pacific Rural Press by T. H. Means, San Francisco.]

We have heard much of rural credits in the last few months. The cause of much of this talk has been the fact that in the west a great many farmers have recently taken up land and have not succeeded in making a living on it. This is true, not only on Government Reclamation Projects where the initial cost of the land is nothing, and where the cost of the irrigation system is returnable to the government on very easy terms, but is equally true in California where settlers on subdivided trdcts find themselves unable to make a living and pay for the land, too.

A few years ago a small irrigation project was built in the central valley of California and the land under it divided into small tracts for sale. The owners of the project realized that in order to sell this land and get their money out of it it would be necessary for the farmers to make money. The land was well adapted to alfalfa, and it was thought best to encourage the growth of this crop because it is quick maturing, and in order that the farmers might have a constant market for their hay the company decided to encourage the dairy business. An offer was made in which the land company agreed to finance farmers in the purchase of dairy cattle. The company offered to furnish the farmer all of the cows he could feed without cash payment. It was the theory of the owners of the project that if a man experienced in the dairy business had sufficient capital to make a small initial payment upon the land and to put in a crop of alfalfa, it would be good business on their part to advance him sufficient capital to buy dairy cows to consume the alfalfa and to take pay for the cows out of butterfat sales. If necessary, payments on the land would be deferred.

During 18 months about 1200 cows were purchased and distributed among the farmers. The company started the work by buying cows and selling them at cost prices in small numbers. This arrangement proved unsatisfactory, and after that the company bought no cows direct, but allowed the farmer to select his cows, and make his own bargain—the company simply furnished him the money necessary. The cows were furnished in any quantity desired up to the amount of feed possessed by the farmer—from 1 to 50 were supplied to different men. In accepting the cows the farmer agreed to pay one-half of the cream check towards the cost of the cows, with interest at 8 per cent on unpaid amount. In a few cases a definite sum, such as $3.00 per cow per month, was paid.

The land company attempted to secure co-operation from the local banks, and have them make loans to the farmers for the purpose of buying cows. The local banks, not being familiar with this kind of business, shied. In fact, they thought it very poor business for a bank to engage in. They found all sorts of practical difficulties, and very much doubted the security they would have owing to our poorly constructed laws. So the arrangement was finally made in which the farmer signed a contract to purchase the cows from the Land Company and gave a note for the cost price. The land company indorsed the note and deposited it in the bank for collection. The creamery receiving the farmer's cream deposited his check each month in the bank; one-half of the amount was credited to the farmer and one-half to the note. A little over two years was required to pay for the cows on the average.

This arrangement accomplished three things: First—it assisted the land company in securing a good class of settlers—dairymen.

(Continued on page 205.)

THE LAW DOES NOT FAVOR BANK LOANS.

The present banking laws of California do not encourage the loaning of money by banks or loan companies to farmers for the purpose of buying livestock because a chattel mortgage is only binding so long as the livestock is on the farmers' premises and is not binding if moved. Some banks have overcome this kink in the law by first buying the stock in their own name and then reselling to the farmer, taking a mortgage on the stock for the amount owing. This process makes it possible for the banker to loan money and at the same time secure his loan with the cattle, no matter where they may be found. The State does not, however, look friendly upon this practice, on the ground that the banker becomes a livestock dealer rather than a banker in such instances and has no right to assume such risk.

The interesting article herewith by Mr. T. H. Means shows one way that the banker can loan money for the purchase of livestock and still comply with the law.—Editors.

Loans on Dairy Cattle Are Safe because Returns on the Investment Begin in Two Weeks after Purchasing, and the Security Increases with the Birth of Calves.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, San Francisco, for the week ending at 5 p. m., February 8, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	2.23	27.76	26.73	60	44
Red Bluff	.46	17.17	14.97	56	40
Sacramento	.70	15.47	11.70	60	38
San Francisco	1.99	23.94	13.65	62	44
San Jose	1.12	14.43	9.76	66	34
Fresno	.71	8.94	5.61	66	38
Independence	0	9.24	5.49	42	—
San Luis Obispo	1.04	23.18	11.78	72	42
Los Angeles	.08	17.25	8.99	66	44
San Diego	0	10.89	5.83	62	44

THE WEEK

We are beginning to suspect that the movie-millionaires have been lying-in with the weather prophets to produce the particularly uncharacteristic winter we have been having this year. We have been selling climate to these film-producers until we have taken to quarreling among ourselves as to what part of the State can produce the ultimate percentage of winter sunshine, good for photography. We have even produced evidence that some spots around the bay of San Francisco really have more sunshine than Los Angeles! The result is that we have so filled the State with movie-queens and bold highwaymen, so dotted our landscape with ruined pasteboard castles, and so threaded our hill-top ridges with bogus Arabs and real camels, that if General Fremont should return he surely would be surprised at our rapid advance in world-conquest. All of this is not bad, in a way, but one result has been the production of so many million miles of sunshine films that there is danger of burning the eyes out of the world. The film-merchants therefore find that they must run off a few million miles of film this winter with lower light-tones, and they need also a lot of water-soaked heroes and flood-swept castles to give their merchandise proper scope and variety, and to add to their repertoire some humid scenes and actions. They have found it impossible to realistically produce the loading and floating of Noah's ark with burning sunshine on an arid landscape—and a few other baffling desirabilities like that have convinced them that, with all the properties on hand, the actors ready and the temperature right for winter-photography, it is up to them to get the water—and this they have done abundantly; yea, even copiously. And now we shall have California chicken coops floating down the floods of the Yangtsekiang just as we caught sight of California adobe ruins as we followed the triumphant procession which Ahasuerus arranged for Modecai. Thus, whether the world sees it wet or dry, it will see California just the same, owing to the necessities of the movie-millionaires and the pliability of the weather-prophets. And the rest of us have to be content, for all things on the earth, even though they be good things in their ways, must have an end.

Mastery of Waters.

But, seriously, it is an interesting fact that a national movement for control and prevention of floods, which is now making great headway, is a product of the arid region, for it found its initiative in the far-from-arid brain of Senator Newlands of Nevada, who is at least the godfather also of the national irrigation law. It seems a paradox that a part of the country which has the least water should teach water-handling to parts which have most water—but it really is not more startling than some other things which the active, clear-eyed West has taught the complacent and somewhat weary East. The progress of this instruction in the case of water-handling is, however, interesting. In Congress the other day the leaders of both great political parties spoke vigorously in favor of the same legislative measure—which seems to mean that neither party can afford to be left out of it. The measure was the appointment of a new standing committeee to handle legislation relating to flood control: "Its sole purpose being to investigate the greatest economic problem of the next generation and to expedite the work of Congress in its solution." The new committee is to make a painstaking scientific investigation of the whole subject of flood control, vitalizing a movement that has been agitated in Congress for several years for co-ordination of forces that have had to do with internal waterways, floods and kindred subjects. While the action of the House does not provide directly for any such comprehensive scheme as that of Senator Newlands—to create a waterways commission and a board of river regulation to promote commerce by development and improvement of waterways—it is thought to foreshadow a general reorganization of the present system of river regulation and improvement. And so it may come to pass that the arid region may teach the humid what to do with water—in getting it away from, as well as toward, the land.

In this connection it is interesting to read the declaration that "when the engineers have used up all the available money for the uncorking of the Sacramento river next December or thereabouts, the channel of the river will be so widened and straightened and its capacity so increased, that the State capital need have no fear of any inundation."

And when the rivers are fixed to discharge flood waters, or perhaps before, the security of life and property beneath stored or reservoired water should be provided for. Reports are that the dam which gave way in San Diego county was either not a good structure or had been neglected. Certainly all large structures holding water should be under State control and inspection, and all individuals, corporations and municipalities should be forced to make such structures secure. This is a form of paternalism which no one should oppose.

Another Liquid Movement.

But while there can be no difference of opinion that both water and whiskey should be under effective control, there is another substance which should be flowing and free, and that is money. We have left water and whiskey too free and have reservoired money too tightly, and have been trying to live with a delivery system which has been full of rusted plugs and padlocked faucets. But, thanks to the agitation of this subject far and wide throughout the country during the last few years, these obstructions are being knocked somewhat free, and money is becoming more liquid, as its service to mankind requires it to be. We are not sermonizing on this subject now, as is our wont; we are simply blasting a hole in this column for a very significant fact, to wit: the Federal Reserve Board in Washington has approved a reduction from 6 to 5½ per cent for the San Francisco Federal Reserve Bank on rediscounts of paper of more than ninety days' maturity. And this fact is explained by James K. Lynch, of the reserve bank of this district, in this way: "This is an indication of abundant money in that it was found that the banks were not rediscounting this class of collateral, which is confined to agricultural paper, at the 6 per cent rate. So we thought it would be well to try a 5½ per cent rate. There is no change in the rates for other classes of commercial paper. Under the present money conditions there is very little rediscounting being done by the San Francisco bank."

Now this is very good, so far as it goes, for it shows a tendency of money to become liquid—to flow to the need for money. But of course the movement is slow, like molasses in February. Why not warm it up, Mr. Lynch? Why not apply for permission to chuck it out at 4½ per cent as was done in the Southern States a few months ago?

Forgotten Money.

And speaking about the availability of money as essential to human activity and industry, is it not interesting also that people can successfully forget money; either willfully or otherwise, who can tell? Who knows, for instance, whether William Anderson, who, twenty years ago lived in Alleghany, Sierra county, is intentionally forgetting that he put $12,525.52 into a San Francisco bank more than twenty years ago? If William does not wake up very quickly, the State will get his money, for the State Superintendent of Banks reports a total amount of $119,293.93—made up of 5355 deposits in National and State banks in California which have not been touched for twenty years or more. The law says all money in such condition shall be turned over to the State, and William Anderson stands in to lose more than anyone else in that way, for his roll holds the record for dimensions of forgetfulness. Will not some reader remind William to call around and get his money?

Lost Money.

But there is another indication of immobile money in San Francisco, and it strikes us as very sad. It appears that the January imports at this port reached a valuation of over thirteen million dollars, which is about fifty per cent greater than ever before in a single month, and of this amount about five and a half millions were the value of Australian wool passing through to the manufacturers on the Atlantic seaboard. There were about twenty million pounds of this wool—nearly twenty cents

a pound, a little more than our own best valley wools are worth at this date. The sadness of it is that California could have produced this wool without taking land away from anything else, and probably would have done it if the politicians had not taken the duty off wool. And there is another sadness about it which ought to appeal to the same politicians; as this Australian wool pays no duty it contributes nothing to the preparedness which the same politicians are now exalting. As the Bible says: "It is a just recompense of reward."

Inspection and Geographical Quarantine.

We are having to listen to a good deal of growling these days from people who find themselves unable to buy plants and trees in places where they wish to buy them, because of local county and district quarantine regulations, which are apparently based, not upon the occurrence of pests on the trees and plants under consideration, but upon alleged existence of such things within certain geographical areas. There is very grave doubt of the correctness and reasonableness of such restrictions upon trade, when applied to insects and diseases which are readily detected by expert examination. In other words, geographical quarantine is directly at enmity with expert inspection in all things which can be detected by careful examination. There may be certain obscure diseases which do not disclose their presence to qualified examiners, and against such, probably, geographical quarantine is the only safeguard, but for things which can be seen geographical quarantine is irrational; and to maintain expert inspectors is irrational also. Because, if we are to trust to inspection we need no geographical quarantine between different parts of the State, except against the invisible—though, of course, an import quarantine may be very desirable, as the work of Craw, Ehrhorn and Maskew has clearly shown. Besides, the better the import quarantine against what is obscure or impracticable of detection, the less reasonable within-State quarantines become. Looking at it the other way round, if quarantines are rational, then we need a lot of policemen on county or district lines to stop all movement of fruits and plants, and we do not need inspectors, who are paid for their ability to tell whether stuff is clean or unclean. County horticultural officers may be pardoned for reducing their responsibility for detection by multiplying local quarantines and condemnation of environments of the stuff they are supposed to pronounce clean or unclean, but it is a question whether this cannot be pushed beyond reason and to the great inconvenience and loss both by planters and propagators. There really seems some danger of our great horticultural State, which should stand as a unit in our own eyes and the eyes of the world, becoming subdivided into a lot of warring horticultural principalities with its own petty princes and their courts—which we count against the interests of the State. This is one of the things which should come under consideration by the committee called for by the Visalia convention for the purpose of reviewing and revising the horticultural laws of the State. It should be settled soon which are the correct points of view to be held in State horticultural work, and this matter of local quarantine policies is one of the things to be carefully looked into.

Work for Those Who Want It.

It is interesting to note that a State employment office was opened in this city, at 933 Mission street, on February 1. This is the beginning of work under an appropriation of $50,000 by the last Legislature to enable the State Labor Commissioner, John P. McLaughlin, to furnish a clearing-house for labor and employment in general throughout the State. The office of the Labor Commissioner plans to circularize the State with 10,000 letters, soliciting co-operation and support in the movement. As the law provides for the establishment of similar employment registries in Sacramento, Oakland and Los Angeles, the effort seems planned chiefly for city unemployed, though the commissioner plans to collect opportunities in all the tributary country of these towns. It is, therefore, a beginning which may teach some useful things. If it succeeds it should be extended to all the populous counties and such clearing-houses established at the county seats thereof. It gives all honestly disposed toward self-support a chance to declare their intentions; and county constables could expedite the approach of all wanderers toward such meccas of their desires. This would segregate all such from the professional hoboes who lead them to riot and disorder, and the latter could be more surely distinguished and provided for. It looks like a very reasonable arrangement both for labor and those who desire its services, and all should advance the provision to a fair trial of efficiency.

Queries and Replies.

Querists must give name and address.

Brown Rot on Apricots.

To the Editor: What can be done for large decayed spots or places on apricots?—A. W. S., Los Gatos.

You probably refer to brown rot. Clean off while pruning all dried fruits which may be holding over on the twigs. Spray with strong Bordeaux before growth starts and with weak Bordeaux soon after the growth has started.

Corn Smut.

To the Editor: How can we prevent smut in corn? Is it the weather condition that causes it? Three years ago there was smut and it seems to be getting worse each year. Last year we dipped the seed corn in formalin, but it seemed to do no good. How can we prevent it, as we are getting hungry for roasting ears?—M. T. K., Redding.

There is no demonstrated specific for corn smut. Its occurrence may be influenced by summer moisture, but even that is not demonstrated. The smut spores live over on the old stalks and stubble and treatment of the seed is not effective. Preventives consist in gathering and burning all refuse from the previous crop, or else rotate your crops and put the corn on ground not recently used for it.

White Ants on Fruit Trees.

To the Editor: What shall I do with white ants? They have eaten off the bark of several young prune trees that I planted out.—G. C., San Martin.

When they are eating off the bark, as you describe, and can be seen at it, they can be easily killed by spraying with kerosene emulsion or tobacco extract, probably. But white ants usually work out of sight, mining out galleries upward from the point of entrance. They are therefore hard to locate. When the entrance place is found, however, they can be killed all through their galleries by thoroughly wetting soft rag or cotton batting with carbon bisulphide and holding it, or tying it, over the entrance so that the vapor penetrates the burrows.

Walnut Blight or Sunburn.

To the Editor: I have four English walnut trees about ten years old. Last year one tree blighted; this year they all blighted. The nuts turned black on one side and the kernel was shriveled. Can you tell me what to do for them?—O. A. N., Porterville.

Without specimens taken while growing we cannot be sure whether this was blight or sunburn. Blight usually occurs as a spot at the blossom end of the nut and on the sides. Sometimes these spots become confluent so as to cover parts or all of the nut, but injury characteristically on one side may be sunburn. If the trouble is blight there is reason to think that a thorough spraying with Bordeaux or lime-sulphur before growth starts may prevent a good part of it.

Alfalfa in Young Orchard.

To the Editor: I want your advice on sowing alfalfa in a young orchard. Some people tell me it is all right; some say it is not. Could I sow a strip leaving room to cultivate the trees and not hinder the growth of the trees? The soil is deep silt and very rich. I need the alfalfa to feed my cows so I can have an income until my orchard comes into bearing.—Subscriber, Los Molinos.

On such soil, if you have water for the alfalfa and can irrigate so as not to water-log the trees, it is all right. If you expect to divide the rainfall between the alfalfa and the trees, the alfalfa will get most of it and dwarf the trees. There are cases in which the natural soil moisture will carry both trees and alfalfa, but usually it is not so. If you wish to try it, sow the middles, keeping the trees in an 8-ft. strip, four feet each side of the row and keep this deeply worked and thoroughly—not less than five inches of well pulverized soil all summer. Keep it up as long as you get thrifty growth of trees. Failing that, plow under the alfalfa as soon as you see the trees are not going the right way.

Right of Way for a Ditch.

To the Editor: Will a neighbor taking water through my land to irrigate his place establish a right-of-way in 5 years if I don't charge him anything? If so, how can I without charging him, keep him from getting a right of way? The ditch is to be plowed in after irrigating, each time.—S. J. M., Campbell.

We have not much more respect for a newspaper-lawyer than we have for a sea-lawyer. The way to get law is to patronize a practitioner whose business it is to get at all the facts before giving advice. However, we give this as our solemn judgment in the matter. In order to be safe you should secure from your neighbor a writing to show that he understands that his use of the ditch is by your permission and that he does not use the right of way as adverse to your ownership thereof. Or you can give and record a lease for such use of the land for a definite time for a valuable consideration, say one cent, and, if you feel that you have been unneighborly, you can give him back the cent afterward. This may not be absolutely necessary, but it might make your heirs a lot of trouble to prove the use permissive unless there is writing to show it.

Mistakes in Training Apple Trees.

[Written for Pacific Rural Press.]

"What is the first mistake a newcomer makes with apples?" we asked F. W. Duncombe of Beaumont, who has handled several of the orchards of that district, and was recommended as one who knows the game.

"Pruning," was the reply.

This was certainly the most evident fault of the orchards we had seen, for a cleaner, more vigorous and healthy lot of young orchards could scarce be desired. The stand is generally almost perfect, and the trees uniform. But perhaps a majority of trees were full of main limbs which are already crowding each other at seven years and less of age.

"There ought to be only three main limbs, started as far apart on the trunk as possible, and well balanced around the trunk. They ought to be joined to the head by a union in which the visible line of connecting growth is short, not reaching over half-way around the junction. A union where a long straight line of connection is visible nearly to the bottom of the branch, is very likely to split off when loaded or tested by wind." Such a limb is usually set more nearly horizontal at the union.

"A pruner must be imaginative, looking ahead to see the tree as it will be ten years from now. The limbs will be growing all that time, and the pruning should and can be done so no cut of new wood need be over three-fourths of an inch in diameter.

"The first four winters of an apple tree I would cut back the new growth to make a stockier frame and induce vigorous woodgrowth.

"At a year old, I leave three new limbs 14 or 15 inches long, instead of nine inches, as I used to. This is because I want the head low down, but the new growth of the second year should be high enough to avoid injury by the whiffletrees.

"At the second winter pruning, leave two properly balanced limbs, about nine inches long, on each of the first three, and at the third pruning, leave about two on each of these. At the fourth pruning, fill in any holes and perhaps double the number of branches again.

"Individual trees will require variations from this ideal, to suit the tree and variety.

"After four years old, there is no need to prune for increased size. Turn the tree's energies into bearing instead of wood growth. Do not prune in winter except to cut out dead wood and interfering branches, and to thin out where brush is too thick.

"Top back the new growth (not heavily) all summer, preferably in August. The stoppage of sap flow will force side buds to become fruit buds and spurs. I have seen apples here on last year's growth. When enough spurs have been started by a few years' summer pruning, leave the trees alone except to thin them out and keep them open to the sun for vigorous fruiting and high coloring inside the tree.

"In cutting back in summer, I prefer to leave a branch or a promising bud just below the cut.

"These methods are for commercial plantings. For home trees, younger bearing might be desirable and fruit buds would be left wherever found. On Winesap and Delicious, these are mostly in the body anyway, but in Rome Beauty, for instance, many of them are on the tips and would have to be left for earlier fruiting."

Avocado and Mango in California.

Editor Pacific Rural Press, Dear Sir: Consider the avocado (you do, under date December 15) how it grows. Even Solomon in all his glory had no eating superior to it. However, this refers to the fruit in its native haunts and not the representative found in our markets. Even as found, it is eaten avidly by those who know it and occupies a prominent place at dinners of mark. It is, nevertheless, a mal-conditioned affair for the reason that, in order to reach our markets unspoiled, it must be picked before it is fully ripe and, unfortunately, it will not properly ripen after being picked. It merely softens without acquiring quality. This is likely to impose a limit to its profitable culture in California. It is at its best when fully ripened on the tree and, unfortunately, has almost no keeping quality, beginning to spoil by black rot in the pulp very soon after being picked. But for this it would be plentiful and cheap in our markets at present.

Throughout tropical America it is grown in great quantity, and in the city markets is stacked up in great heaps that can be had at almost any price. I have bought it at two for a cent, retail, and for fifty cents (Spanish-American silver) one would need a bull cart to carry away what could be bought. Literally. When a vessel has been in port for a week and the mess supplied with vegetables by a bumboat woman, she may, as a parting gift of small value, present a bushel or more of prime avocados. I have seen it done.

If it is ever to become a fruit produced extensively in California it will be necessary to Burbank keeping qualities into it or produce a fruit that will properly ripen after being picked. Even when that is done it is difficult to see how any extensive market can be developed. It is not a fruit to be eaten offhand, but is a salad fruit only and one which soon palls. It is for occasional eating only, and as such can only have a limited use. Without doubt those who first bring the trees to bearing will obtain ample reward, but it seems well to beware a very extensive planting. Where it can be raised, every one should have at least one tree for home use, thereby being able to get it in prime condition.

The Mango.—While looking about for new fruits that may come into extensive use, what is the matter with the mango? Many persons do not like it at first trial, but once the taste is acquired one rarely tires of it, and it should become as universally eaten as the orange. The small, large-pitted ones sometimes seen in our markets give no idea as to what a mango really can become.

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QUALITY, SERVICE.

We Have a Large Assortment of

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRICOTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote you prices.

Catalog and Prices Mailed You on Request.

The finest fruit in the world grow at Cavite, the naval station across the bay from Manila, P. I., luscious fruit six inches or more in length with a thin, flat pit, it is a fit fruit for the gods. I once heard a Tagalo say that it was good enough for a friar to eat. Of course this is a highly developed variety and probably could not be introduced directly into California, unless possibly into the Imperial valley, but if care enough and time enough were taken no doubt Cavite quality could be bred into a hardier variety. Perhaps it would be necessary to first produce the hardy type, then take it to the Philippines for crossing and finally return the results. Possibly pollen from the Cavite type could be kept alive at low temperature and brought here for the crossing. It would be a long process and one for a young man to attack, but extremely interesting and worth the effort if successful, because of all the tropical fruits proposed for California growing I think it would eventually fill the largest place. **W. Stuart Smith.**

Lemon Cove, Cal., Jan. 15.

Apricots Due to Irrigation.

[Written for Pacific Rural Press.]

Apricot orchards may be seen on a trip in almost any section of Imperial county, but close inspection of all but a few of the best reveals slight new growth on trees six or eight years old, and fruit buds scarce or weazened as if dried out. The fact is that they do not develop well with the methods used by a large majority of the growers; and hence the comment on all sides, that apricots do not pay.

Among those who get regular crops, and strong new growth is H. S. Reed on the Edgewild Ranch near El Centro.

Deep roots established while the trees are young, plus continued adequate irrigation, make the difference. Imperial Valley soil was dried out perhaps for ages before man's occupation. Most farmers apply two or three acre-inches per irrigation and think they have soaked the ground deep. That water goes scarcely below the plowed ground and the roots can go no further than the water. Trees that have been pulled out, show root growth about a foot deep, spread abroad in all directions. Very little fertilizer is ever used, and the fruit buds starve for plant food, while the roots suffer from the heat and periodical drying of the surface soil.

Deep Root System.—Mr. Reed got a deep root system. He studied the problem before planting the 4,000 trees seven years ago. He ran a Killefer subsoiler nearly two feet deep down the prospective rows and every year for three years the subsoiler opened the deep dirt between the trees for moisture.

He flooded the ground, and when the water had sunk away, he reflooded it. A post-hole digger used to see how deep the water went, failed to bring up dry soil. Then the trees were planted, and perhaps water was used to settle the dirt about the roots. Then they were "starved for water, forcing their roots to go down after deep moisture put there by winter flooding. Now, though he plows as deep as two horses can pull a 14-inch plow, he says," I have never seen a root turned up.

"Irrigation here is the whole thing; cultivation is merely secondary," says he, "and the fact that his trouble is to thin the fruit will perhaps surprise other apricot growers." We must thin the fruit as much as possible at pruning time to save expensive hand thinning.

His system of irrigation now is similar to that of E. H. Erickson, of Brawley, who is elsewhere in the valley quoted as a successful apricot grower. They fill the checks a foot deep or only slightly less, in December, and when that has settled away, they give it as much again. Always a disking or harrowing follows each irrigation as soon as possible.

"If I were on "hard" land instead of having loose soakable soil," says Mr. Reed, "I would plow before flooding. My soft soil takes water all right, so I will wait."

As soon as the pruning is done, the orchard receives another flooding; then it is plowed to open the top soil to spring warmth.

When the fruit pits begin to harden, an irrigation is given in furrows to keep water away from the tree trunks, and to supply the extra moisture needed at the period of fruit formation.

The subsoiled moisture must then supply the trees till the fruit is off, when they get another thorough watering to help develop the characteristic strong fruit buds of this ranch. This is repeated every six weeks till Nov. 1, when the sap drops back for the winter. Thus the deep root system is made and sustained in fertile soil, by adequate irrigation. This means more water here than in a country which has moisture deep down and is helped by winter rains, of which there are practically none in Imperial Valley.

Fred Arth of San Bernardina county has 270 Valencia trees which last year yielded 2192 boxes that sold early in the season for $2500. The same trees produced 1800 boxes the year before.

Seed Rice

Wateribune Variety.

If you are in the market for seed rice, buy the best.

Seed which is absolutely free from Water Grass, by official test, is what we have.

Price, $2.25 per 100 lbs, F. O. B. Madison, Yolo County.

Hints on Purpose of Pruning.

[By Tom Henry, Horticultural Inspector, Paso Robles.]

Pruning, the one of the important practices towards successful fruit growing, cannot of itself produce strong trees, loaded with good fruit, without the other important orchard practices, such as spraying, tillage and maintenance of soil fertility. No matter how skillfully we prune, unless we maintain the proper soil conditions we cannot expect to secure satisfactory results.

Probably there is no other operation in the production of fruit, concerning which there are such wide differences of opinion as prevail with regard to pruning trees.

In the pruning of trees there are some sound, practical and scientific reason for different things, and unless one knows why he is pruning and what he expects to gain thereby, he is not likely to do it very intelligently.

Difference in opinon as to the time of pruning also prevails in all sections, each one having reasons for their particular idea as to when to prune. Nevertheless with all this wide variance in ideas there are a number of principles one must follow to be successful in the work. These principles may be summarized as follows:

1. To modify the vigor of the tree.
2. To keep the tree shapely and within the bounds.
3. To make the tree more stocky.
4. To reduce the struggle for existence in the tree top.
5. To open the tree to the sunshine.
6. To remove dead or interfering branches.
7. To aid in stimulating the development of fruit buds.
8. To thin the fruit.
9. To make thorough spraying possible.
10. To facilitate the harvesting of the fruit.

The pruning which a tree receives during the first two or three years after it is planted has much to do with its future. Mistakes at this time are practically irreparable; on the other hand, if the tree has been properly pruned the first few years, subsequent errors in the pruning, if they occur, will admit of correction without permanent harm to the tree.

Nearly all authorities on pruning believe each kind of fruit has its particular way to be pruned and each variety of that kind also has its particular way to be pruned. Still there are three great fundamental underlying principles connected with the pruning of young trees. You might say there are three lessons, and if these are mastered the problem of pruning young trees becomes rather simple; but unless they are mastered it is difficult to develop strong and well-balanced trees.

The first lesson is the choosing and spacing of the scaffold branches.

Three, or four branches properly spaced around the young tree and having them as far apart as they can be conveniently spaced will produce a strong and well-formed tree.

The second lesson is to learn to keep the main branches or sections of the tree properly dominant—that is if one branch tends to grow at the expense of the rest of the tree, the weaker branches gradually become side branches. If proper pruning is done this can be obviated. The average pruner does one of two things. He may be one of those that cuts the tree level across the top. This will never build a strong, well-balanced tree, because in doing this you pay no attention to the relation of one branch to another. Another group of pruners are apt to cut the weakest wood the most and the strongest wood the least. He goes on the principle that heavy pruning causes greater growth. This is true on a tree as a whole, but has little to do with the relation of one branch on a tree to another. If you have a strong branch in close proximity to a weak branch, the best way to strengthen the weak branch is by cutting back the strong one. The development of the weak branch will be in proportion to its leaf and branch area. If there is a large amount there will be a heavy demand on the sap and the branch will develop. The heading back then, should be done not so much from the point of view of the tree as a whole but from the point of view of the relation of the branches to each other.

The third lesson is how to avoid the sharp angled, equally balanced crotches. This is done by following the usual principle of allowing two branches of this season's growth to remain to one branch of last season's growth, but not having these two come from the end of the branch. They should be spaced as far apart as possible and in pruning these you must cut one harder than the other, thus one will become a leader and the other a side branch. A tree thus pruned will have its strain distributed in such a way as to reduce the breakage to a minimum.

All branches that cross or interfere should be removed. The habit of removing water sprouts is rapidly changing to one of heading them back to two or three inches in the early summer then keeping the new growth cut back so that at the end of the season the water sprouts will be about six inches in length. The possibilities are that this water sprout will produce fruit spurs low down on a tree whose main branches are bare of fruit spurs.

Trees should be pruned with the habits of the tree always in mind. A wide spreading tree should be pruned to an inside bud, and an upright growing tree should be cut to an outside bud.

At least two-thirds of the past season's growth should be removed.

Almond planting at Elsinore is on the increase, the nuts being sent to the Banning warehouse.

"Green Spot" Not "Brown Spot."

[Written for the Pacific Rural Press by Prof. H. S. Fawcett.]

I wish to call your attention to a statement in your paper of January 8d, under the heading "Orange Brown Spot." The discovery that I made was not in regard to the brown spot, but was in regard to the green spot, which is an entirely different trouble, and the cause was not the application of citric acid from orange peelings, but oil squeezed from peelings. I really doubt whether there is any citric acid in the peeling itself. The correct statement in regard to the discovery regarding the green spot, is given below from page 192 of Bulletin 262. In the same Bulletin, on page 191, I have a discussion of brown spot, which shows that this article mis-states the fact. I would be pleased if you would correct this statement, and perhaps give a definite statement in regard to the discovery of the lemon oil causing the green spot.

We give the references to the two spots as follows:

Brown Spot.—A spot disease occurring principally on Navel orange fruits in California is known by this name. The spots vary in size from a mere point to one-fourth inch in diameter; they are dark brown and sunken, begin to develop five to ten days after the fruit is picked, and are usually not visible on the tree. J. E. Coit attributes the spotting to the premature death of certain cells near to the surface of the rind due to oxidizing enzymes. The primary cause or agent that brings about this result is as yet unknown.

Green Spot.—A marking of the surface of lemons known as "green spot" is troublesome during some years in California. It is not known to occur in Florida or Cuba. It usually occurs in the fall and winter on the fruit that has come in green or light green from the orchard. The spots remain green in color after the remainder of the surface of the rind turns yellow in curing. In the spots the oil cells stand out prominently, the surface between them having been slightly depressed. It has been found recently that one of the causes for these spots is the effect of lemon oil liberated from some of the cells of the rind in picking and handling. J. D. Culbertson, of the Limoneira Company, first showed by experiments on sound lemons that the oil pressed out of the rind of one fruit had a remarkable effect on the rind of another fruit uninjured. The writer caused the development of the typical "green spot" in moist jars, by pressing out on the uninjured surfaces of green fruits small quantities of lemon oil. The spots were also produced by a pressure of the skin just sufficient to liberate the oil. Fruits not so treated kept under similar conditions developed no green spots. The depression of the surface of the rind between the oil cells took place in a few hours, but the typical green spot was only evident in four to six weeks, after the remainder of the rind had turned yellow.

WHAT ABOUT STANDARD

To the Editor: I intend to set out a young orchard, mostly in prunes, this winter. I would like to know about the Standard prune. There are a number of orchardists in this vicinity who set out a number of trees the last two seasons and some of them say now that they are sorry they did as they dry away more than other prunes. As it is a new prune among people here would like your advice.—J. A., Morgan Hill.

[Answered by F. C. Willson, Sunnyvale.]

[I have had no personal experience in growing the Standard prune. I have seen it grown on young grafts and, making allowance for the fact that they would not probably be as sweet as grown on mature trees I would hesitate to plant it myself for a drying prune. At the same time I would give no advice to others, as I am not well enough acquainted with the variety. In judging of the value of fruits for special purposes, the product should be taken from fairly mature trees under normal conditions. On the other hand we expect with "French Prunes" a lighter shrinkage on young orchards than on old. Have heard same complaint your subscriber makes from same district.]

RESEEDING ALFALFA.

To the Editor: I want to try and thicken some of my alfalfa. Which is the best, to go over with a spring tooth harrow first, and then sow the seed and go over the ground again, or sow the seed and then put all the work on after the seed is sown?—Subscriber, Merced County.

[It is better to do the work before sowing and then cover very lightly—a brush drag being largely used to cover.—Editors.]

Estimates from Florida are to the effect that 50 to 55 per cent of the orange crop of that State has been shipped.

THE BULL WITH THE PULL

What is This Vine Disease?

To the Editor: I desire to call your attention to this clipping from the Fresno Republican:

"Experiments are now being conducted by the vineyardists of the foothill district of Tulare county which give promise of relief from the devastating black rot. Emil Gundelfinger says that the promised remedy is one of the most simple yet tried out, and is the result of investigation by Japanese experts who came here last summer to investigate the horticultural industry of California. It consists merely in making use of the Bordeaux spray just before the vines begin to bloom, and then if the disease remains apparent, a second spray is made just after the grapes begin to set. This has proved highly successful in the Clovis district, where with the heavier soil the black rot had gained a strong foothold.

"Mr. Gundelfinger declared that this treatment was in use last season by Japanese growers near Clovis, and one Japanese grower there whose twenty acres the year before last produced five tons of raisins, last year, entirely as the result of the spraying, had a production of twenty-five tons. This was in the Garfield district."

Last spring the unopened blossom buds on my Thompson seedless vines blackened and dropped off. I supposed it to be mildew, and treated with sulphur. Was it grapevine mildew? The trouble yielded to the treatment only partially. I am unfamiliar with the disease described in the clipping. Could it have been what affected my vines, and should I this year follow the treatment outlined, or will sulphur applied earlier do the work? **Chas. E. Dailey.**

Reedley.

[Comments by Prof. F. T. Bioletti.]

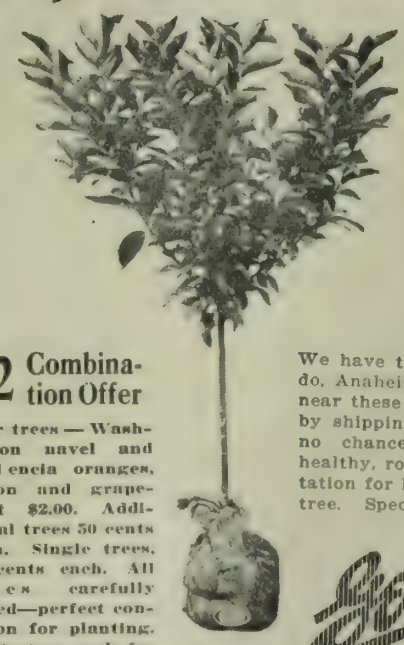
Complying with your request that I comment upon the letter of Mr. Dailey, submitting a clipping regarding the supposed remedy for black rot, I would say:

The black rot of the grape is a fungus disease which does serious damage in the southern states, but it does not occur in California. What is meant by the black rot described in the clipipng I am not sure, but it is probably either the black knot, which forms lumps on the stem and sometimes on the branches of the vine, or the black fungus which often attacks close bunches of ripe grapes in the warmer parts of the grape-growing region.

The remedy proposed, namely spraying twice with Bordeaux mixture first just before the vines are in bloom, and second just after the grapes have begun to set would not, I think, control either of these diseases. Spraying of this kind and of many others has been tried for the black knot, but completely without effect. It is just possible that it might do some good for the black fungus which attacks the ripe grapes if the Bordeaux mixture was sprayed at the right time. I doubt if it would do any good, however, unless the application was made when the grapes were at least nearly full grown and in that case it would injure the appearance of the grapes, besides contaminating them with copper sulphate.

The trouble Mr. Dailey describes on his Thompson Seedless is probably neither of the diseases I have mentioned, nor do I think it is mildew, although the latter is possible. If it is something else, of course, it is possible that Bordeaux may be helpful, but this is merely guess work until we know exactly what the trouble is.

INSPECT TREES BEFORE PLANTING.



[Written for Pacific Rural Press.]

Crown gall is the cause of death to many old trees throughout the State and it is probably no worse at Banning than elsewhere. But J. G. Replier's observation of his own and other old orchards where the galls sometimes even protude from the ground, led him to be particularly careful not to plant crown galled trees in the 20-acre orchard set out five or six years ago.

Every tree was closely inspected before planting, and instructions were to throw out everything with a suspicion of crown gall. Whether infected trees were overlooked or whether the old vineyard in which most of them were set was already harboring the germs, inspection of the trees a year ago showed galls on 10 per cent of them. These were chiseled off to healthy surface and painted with Bordeaux paste.

D. B. Holmes has bought the old date palms of the Heber garden at about $8 each, according to W. L. Paul of Coachella, and has contracted for their removal to Indio.

-hardy citrus trees

Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grape-fruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees — get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

LATE PRUNING ALL RIGHT.

It is all right to prune deciduous fruit trees until March or even April, according to W. W. Anderson, who has a large gang of men making a business of pruning through the winter months. For several years he pruned two neighboring orchards of apricots and peaches mixed, both under similar soil and other conditions, such as cultivation, irrigation, etc. One was pruned first thing in the fall, while the other was usually left until the last in the spring. The apricots were sometimes as big as his little finger when the trees were pruned—once he finished April 13.

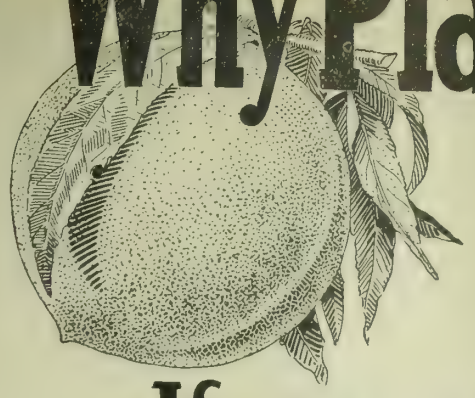
No difference was observable between the two orchards, either in yield or wood growth, according to Mr. Anderson. Late pruned trees would exude a little gum, which protected the cuts but did not waste materially. Ordinarily, however, peach orchards are pruned last in spring, if convenient.

This is different from grape-pruning, where the sap channels are large, and late pruning causes excessive "bleeding." This sets the growth back and makes them leaf out later, which is desirable in frosty locations.

SHIELD-BUDDING THE WALNUT.

To the Editor: After many years of trying, we have now succeeded in budding the walnut. I am sending you a "June budded" walnut tree, something, I believe, never shown before. The seed (northern California black), was planted in March, 1915, tree budded in June, and dug in December. This may not be necessary, but it does away with previous theories. We are budding commercially on 1-year seedlings, with a 98 per cent stand for the season of 1915. **Leonard Coates.**

Morganhill.



[This is very interesting. Apparently a bud with a very long, narrow shield (perhaps two inches long by half an inch wide) was placed under the bark of a seedling, about five-eighths inch diameter, and tied with cord in the usual way. It made a good tight growth to the stock and sent up a very vigorous shoot, about a quarter of an inch thick and seven inches long. We have sent the tree to the University Farm for planting out. This item of Mr. Coates' experience may prompt other readers to tell us what they have done with common shield-budding the walnut. —Editor.]

TREATING VINE STAKES.

To the Editor: I am going to use some grape stakes for young Thompson seedless vines, and because coast redwood stakes sell so high I have bought mountain cedar from the King's river forest. What is the best method of treating these stakes to keep them from decay in the ground. —C. F. W., Sanger.

[We cannot surely prescribe for this cedar, but some kinds of soft wood are made to last much longer by soaking in bluestone solution. Take vats or barrels or other deep receptacles and partly fill with bluestone solution at the rate of ten pounds of bluestone to 25 gallons of water. Peel and point the stakes and stand them upright as they grew in the bluestone water. The bluestone water is more readily taken up if the wood is green from recent cutting.—Ed.]

Why Plant Peaches?

The tendency of those engaged in peach culture is to discontinue further planting—but why? It is an old and well-established rule that just at the time when others hesitate about planting certain varieties of trees, the man with proper foresight realizes that it is the psychological time to embark in the business.

Remember, when you plant an orchard, you are not doing it for one year but for over a period of 20 years, and because prices happen to be low one season is no indication that they will continue so.

The peach business offers good profits to those who go at it right and stick to it.

If you are going to plant peaches by all means PLANT

ROEDING'S

There are many reasons why you should plant Roeding's peach trees—and there are also many reasons why you should consult with us freely before making up your order for the varieties you expect to plant. We have made an exhaustive study of the peach situation and our years of experience will be worth something to you. Write us.

We want to call your particular attention to our new varieties—

PEAK and LIBBY CLINGS,

which are being enthusiastically received by the canners. The fruit is of splendid size, ripening between the **TUSCAN** and **ORANGE CLING** and in the order indicated. You will find a complete description in our catalogue. Our stock of these new varieties is limited—so get your order in now.

Elberta, Foster, Lovell, Muir, Salway are the standard varieties for shipping and drying.

We call particular attention to the new varieties ripening in May, such as **Connets, Southern Early, Greensboro, Mayflower, Oklahoma Beauty and Oklahoma Queen.** They reach the market when other fruits are scarce and they always command the highest price. Plant them for profit.

Calimyrna FIGS

The name **"CALIMYRNA"** is so closely associated with our president and manager—Geo. C. Roeding—that there is no reason to particularize on it, except to call the attention of our friends and customers to its great merits.

The demand for **CALIMYRNA** dried figs has shown a wonderful growth, and still the industry is in its infancy. We thought we had enough trees to take care of all orders, but it begins to look as though our supply will not last through the season.

We can supply you also with **WHITE ADRIATIC** and other leading varieties. We are absolute fig headquarters and it will pay you to write us.

Walnuts And Pecans

—are big money makers.

FRANQUETTE (Vrooman's strain) stands far in the lead among grafted walnuts—and, of course, the grafted varieties are the only sort to plant. Other grafted varieties that are now much in favor are the **EUREKA, PLACENTIA PERFECTION, NEFF'S PROLIFIC, MAYETTE and CUT-LEAVED.** We have a fine stock for you to order from.

The paper shell **PECAN** has a great future in California—nuts selling readily at 50c a pound. We have been growing and successfully fruiting pecans for a number of years, and will gladly give you more information.

QUICK AND SURE DELIVERY

Our methods of packing and shipping have been perfected to the highest point of efficiency, thus assuring, arrival of stock at destination in the shortest time and in A1 condition.

It pays to order early.

ROEDING'S GUARANTEE

on nursery stock means real protection to the planter. We are the largest and most successful nurseries on the Pacific Coast, with a record of 31 years and thousands of satisfied customers. All stock is guaranteed TRUE TO NAME.

You take absolutely no chances when buying from us—no matter how large or small your order.

SPECIAL PRICES ON LARGE ORDERS

We are particularly well equipped to handle orders from large commercial orchardists and those who plant on a large scale. Special prices will be quoted on request.

It pays to order early.

Home-Grown Seeds Usually the Best.

To the Editor: Is there any benefit derived from changing seed barley or wheat seed raised on some other farm, that is, assuming the quality of each is the same? I seem to remember that there is no material difference.—Reader, Maxwell.

[Answered by Prof. J. W. Gilmore, University of California, Berkeley.]

[There is quite a widespread belief that it is necessary to import seeds of various crops from localities having different climatic and soil conditions. The basis for this belief is the fact that seeds of most crops have a tendency to deteriorate when no attention is given to their proper selection or to maintaining their qualities. The deterioration is also sometimes due to untimely or improper culture methods.

A considerable number of experiments, as well as a wide experience, fully demonstrate that when seeds of our various farm, flower, and vegetable crops are properly produced and carefully selected, the seeds grown at home will serve local conditions best.

It sometimes happens that such crops as oats and potatoes when properly grown in northern climates, will outyield poor seed grown in southern climates. When you consider the fact that our cultivated field, flower, and vegetable crops are very much affected by climatic and soil conditions and culture methods, it is evident that when these crops are carefully produced and seeds selected, they became adapted to the conditions of their local environment and consequently are likely to be more productive than similar seeds grown under other climatic, soil, and culture conditions.

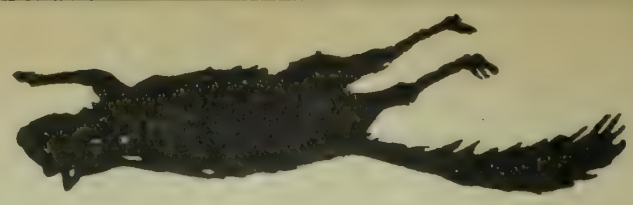
One has only to recall what would be the effect in a very short time of leaving a superior strain of poultry or any other selected breed of animals to shift for themselves. The strain would not remain superior very long. The substance of the matter is, therefore, that the home grown seeds of our crops when properly grown and carefully selected, are best for local planting.]

ALKALI PEACH AND HARDY ORANGE.

Though we believe in growing California peaches on good, sweet soil and California oranges in the most suitable temperatures for the very best varieties, it may interest some reader to hear that a three-year expedition in China has just been concluded by Frank N. Meyer, plant explorer of the Department of Agriculture. Meyer went through Central China 1500 miles on foot to the borders of Thibet, touching some regions never before visited by a white man.

Meyer discovered a wild peach, resistant to alkali, cold and drought, the root system of which offers great possibilities as a grafting stock.

Discovery of the wild peach is regarded as indicating that the peach may have been a native of China, rather than Persia, and the presence of native and hardy oranges and other citrus fruits gave added evidence that China was the home of the orange.



Mr. Meyer believes that his most important discovery probably was the jujube tree, which bears a heavy crop of brownish fruit, delicious when fresh and forming when dried a confection similar to the Persian date. Officials believe it offers a new industry to California and the Southwest. [And it may be added that this fruit has been in California for the last forty years, and is now grown to the extent found profitable—which is not great.—Ed.]

TREATING SEED POTATOES.

To the Editor: I would like to know the strength to have corrosive sublimate for treating seed potatoes and length of time to keep them in solution.—O. J. R., Modesto.

[Dissolve one ounce in eight gallons of water and soak the potatoes in this solution for one and one half hours before cutting.]

Sonoma county hop growers are considering the reduction of the hop acreage 10 per cent next year in order to sustain prices. It is reported that Sacramento valley growers are agitating a 25 per cent reduction.

DEAD SQUIRRELS are the only good squirrels on your farm.

Carbon Bisulphide

will rid your land of these pests. It is **SURE DEATH** to Squirrels, Gophers, Prairie Dogs, Rats, Ants, Etc.

Orange and Lemon TREES of Guaranteed Quality

Being large growers of high class fruit ourselves, we know the importance of keeping in view the true type as well as bearing qualities of the tree. Roeding's trees can be absolutely depended upon under all circumstances. We supply trees to many of the largest planters in the state and guarantee all stock to be true to name and of good quality. We can supply all the leading varieties of Oranges and Lemons and invite your inquiries. We offer large quantities at wholesale planters' prices.

Marsh Seedless Pomelos

—on Trifoliata. This variety bears fruit when quite young and the fruit has more juice, is thinner skinned and finer grained than when grown on sour or sweet roots. Very hardy. Bears early. Can also supply on sweet or sour roots. Ask for quotations.

Olives

We can supply all the leading varieties, including the MISSION, which is an old standard sort, still in great demand and bound to be a profitable crop for the planter; MANZANILLO, a standard variety for green and ripe olives, a prolific bearer and very hardy, producing large crops and big tonnage to the acre; ASCOLANO, a sure winner for the planter. Bears early, ripens early and bears heavily. Don't place your order for olives until you get our quotations.

Our trees are propagated from cuttings from record bearing trees that have been tested for years in our orchards. They are straight, thrifty and well branched so that when cut back for planting they will throw a well-balanced head, producing fine shapely trees. Our Olives are grown in soil producing good, large, thrifty roots.

Tropical Fruits

No garden in California is complete without them. We can supply several varieties of Guavas, Cherimoya, Feijoa. See our catalog for further details.

Ornamental Trees

We have a splendid assortment of ornamental and evergreen trees, plants, shrubs and vines. If you are thinking of ornamenting your home grounds, or wish a few trees for street or avenue planting, we can supply you with some splendid specimens. Write for our catalog or call and see us.

Avocados

We can supply Taft, Harmon, Northrup and all the leading varieties. Perhaps no other tropical fruit has met with the favor that has been given the Avocado. It is highly nutritious, easily digested. Many varieties can be grown wherever the orange tree is grown and will stand the cold exceptionally well. Ask for quotations.

SEND FOR THESE THREE BOOKS

—each is worth its weight in gold to the planter.

OUR CATALOG lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. It will be sent free upon request to any address.

"CITRUS FRUITS IN CALIFORNIA" gives valuable information on the citrus industry. Every grower of citrus trees should have a copy of this book. Write for it.

LARGE RETURNS FROM ASPARAGUS.

[Written for Pacific Rural Press.]

The 100-cow dairy on the A. J. McPherrin ranch in Imperial county was not exactly established for the 45-acre asparagus bed lying across the drive from the corrals, but it saves hauling manure from towns roundabout. Geo. V. Rude, the manager, says fertilization is the most important feature of asparagus culture, and his faith has been shown by the application of 4,500 tons in the past five years or 20 tons per acre per year. The asparagus has responded by yielding about 200 24-pound crates per acre per season, which usually pays about $17,000 for the whole piece after freight and commissions are paid.

Earliest in America.—The price of $2 to $20 per crate is due to earliness. They begin cutting and packing asparagus for shipment to Chicago Feb. 5 to 10, expressing the first few crates, then combining with neighbors to ship carloads. April 25 closes the season on account of the Illinois asparagus taking the market because of its proximity. Cutting could continue considerably longer if there were a cannery to take the "grass"; but Mr. Rude says it is just as well not to cut too long. The roots pay too well to hazard exhaustion by later picking. They were planted ten years ago on level sandy, soft soil, as one-year plants from seed of the Early French Purple Argentilus sown on the place.

There is no sign of old age yet, and they are expected to continue producing indefinitely. This is because the greater part of the year is devoted to storing reserve food for the quick growth of the spring crop.

The season's work really commences when the brushy growth is mowed and burned in the fall. The manure is then broadcasted and double-disked in, running the disk crosswise of the rows. Though each season's new roots are above the rest, the top ones are still six inches under the surface. The rows are eight feet apart being on broad curved ridges with narrow irrigation furrows between.

The first irrigation comes between Jan. 10 and 25. Water is not allowed to stand on the field but is drained from the lower end onto the alfalfa which feeds the cows. It carries considerable fertility to the alfalfa. During picking, alternate rows are irrigated so the pickers can go dry shod. Two weeks later, the other rows are watered, and so on fortnightly. A cultivation follows each irrigation, and water is applied all through the summer, weeds being kept down.

The shoots are cut daily, deep under ground, as soon as they appear. For this a tool is used, being described as a tube some 15 inches long with a handle on one end, a jog bent into it, the lower end opened and flattened out so that the cutting edge is sharp and broad and forked.

The shoots are packed on the ranch, being laid in forms which hold two pounds, compressed and tied together, cut off 8½ inches long, packed a dozen per crate with a little space above for the tips to grow in, en route.

There is no disease or asparagus rust yet, and there is enough salt in the soil so no more need be applied.

IRRIGATING YOUNG ALFALFA.

[Written for Pacific Rural Press.]

Furrow irrigation of young alfalfa in Coachella valley saves water, avoids the baking of land which would follow flooding, and gets a better stand by keeping the ground soft for plants to push through.

An onion "marker" is used to make the "furrows." It is made of blocks of wood nailed twelve inches apart on the underside of a plank. It is run over the alfalfa directly after sowing, and water is run through the trenches thus made, to moisten the flat ridges without wetting them enough to bake. When the alfalfa has stooled out so the ground is well shaded, it is flooded as customary elsewhere. By that time too, the furrows are fairly well filled up.

INCUBATING DATES.

[Written for Pacific Rural Press.]

"Incubating" dates sounds funny, but that is a practice for which regular date incubators are used.

In few places of California or Arizona is the season long and hot enough to ripen dates fully on the trees. Anyway in outdoor weather they would not always ripen and color with the uniformity desirable for fancy dates. So, instead of leaving them on the trees two weeks longer, they are often picked and spread out in the warm chamber 48 hours more or less until they have become of the proper color and texture.

John Deere Disc Plows for Tractors
For Field or Orchard

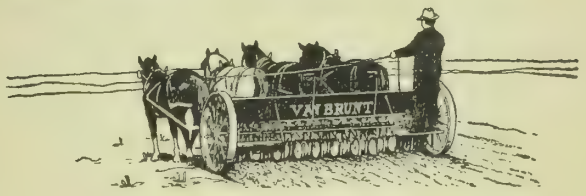
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

Van Brunt Drills
With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

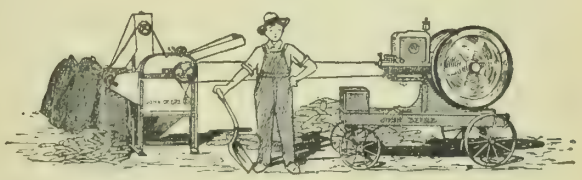
An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

John Deere Plows for Light Tractors
For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.



Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

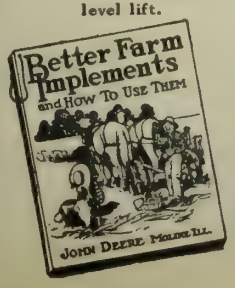
Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.

R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1¾, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.



John Deere Syracuse Plows
The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—extra shares go on easily. Share draws up snugly to its place—a smooth joint formed always.

Syracuse 601 Series, wood beam, sloping landside plows are superior for general purpose work in light soils—the 16 Series, wood beam, with side shifting clevis, for hillside work.

Syracuse J-gang plows, three bottoms, are especially satisfactory for vineyard and orchard work.

Write for free booklets. Also ask about Syracuse non-cloggable spring tooth harrows.

John Deere Dealers Everywhere
Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

Reflections on Spoon-Fed Farming.

To the Editor: Evidently the Press wants the farmer to say yes or no as to wanting rural credits, marketing commissions, etc. During the recent campaign I heard of but one farmer opposing these propositions, and since he owns some 7,000 acres of good land it is evident these things are not necessary to him.

But let me take a shot at Col. Irish in his aeroplane and see if we cannot confuse his scouting cruise to locate our munitions plant. Col. Irish deplores spoon feeding—with David Lubin's spoon—but urges that we use the Reserve bank law spoon, for if the bank must discount long time farm mortgages at 4 per cent, that, in California at least, is not giving our farm securities equal cognizance with securities of other businesses, but would be giving farm mortgages from one to two per cent advantage, also the advantage of long term discounts—spoon feeding some. Which side of the fence will the gentleman land on? It is evident that he sees that the farmer needs cheaper money; he merely suggests a different method of securing it. This is an old politician's scheme: seeing he must either support or oppose a new measure he offers instead, another new measure, hoping that in the confusion of new measures, the proponents will scatter their votes while the opponents without effort easily defeat each one and all of them. Mr. Politician can then claim to not be a reactionary, since he supported one of these favorable measures. If Col. Irish really believes that the farmer needs helping, let him put his shoulder to the wheel of that cart which he sees has the most support. Standing alone beside his own cart and shouting Yo-heave-oh! does not help us a bit.

Again, the argument concerning a state commission to take "charge" of a great merchant's business is intended to deceive the unwary. There is no such commission authorized to do marketing for any particular person, but the law does give us an opportunity to do our marketing through a reliable, responsible medium, instead of our having to depend upon the too often unreliable and irresponsible private concerns; and since the consumer pays the cost of organization—and likewise shares in the benefits of organization—why not pay that expense through taxes to the State as against paying it to a voluntary organization by reason of a higher charge the voluntary organization would need to make? If it is true that the more government does for a people the less they will do for themselves then pity the small producer as an organizer, for having to date done nothing, in the future he is condemned to do minus nothing.

Oh, well! as to these chemically pure reformers—that implies in chemistry that they have come through a retort—let the Colonel pray that it be the retort courteous. And as for the "common garden variety" of politicians, I suspect many of them were raised from those "spoon fed" seeds, and down on the lower side of the instructions for planting is this legend: "Please report the results you obtain to this department." We have been reporting for years now that the results were mighty poor, but still a "paternal" government forces the seed upon us.

The quickest way to spoil a man's initiative is to prevent him making more than a living for just a few years. I know. **E. W. Doane.**

Merced.

Potato Contest Teaches Lessons.

[Written by W. V. Shear, Sec'y West Coast Potato Ass'n.]

In the spring of 1915 the West Coast Potato Association offered prizes for the first, second, and third best acres of potatoes to be grown in California during 1915.

The highest yield was 447 sacks (100 lbs. each) of marketable potatoes. The second highest was 404 sacks of marketable potatoes, and the third highest was 354 sacks. The first and second prize acres were grown in the Sierras and the third acre in the Watsonville district. These potatoes were all of very high quality.

Why is the record for growing large crops of potatoes going from the delta to other sections of the state? A brief outline of the methods adopted for securing these high yields may be of value. These yields were obtained in widely separated sections of the state and therefore represent the possibility of this industry in many localities, although the average yield of potatoes in California is estimated at about 70 sacks per acre.

The writer had the pleasure of co-operating with the prize-acre growers, and is therefore familiar with the methods adopted to secure these high yields, the highest of which comes very near, if indeed it does not exceed, the largest yield before obtained in the United States. Attention is called only to the most prominent features and methods adopted to secure these yields.

All of these growers used the best seed stock to be obtained, at an average cost of three cents per pound. They used from twelve to eighteen sacks of seed potatoes to the acre. The highest yield was obtained by using the largest amount of seed.

All of the seed was soaked before planting to kill fungous diseases which might be lurking on the outside of the potatoes.

All the growers used a large quantity of stable manure and plowed the ground very deeply twice before planting, and the largest yields were obtained by those who used in addition to the manure a large quantity of commercial fertilizer.

They all used plenty of water to grow the crop and gave their fields good drainage.

The cost of growing these prize acres was large, but they were all grown at a profit of at least fifty per cent.

Inasmuch as the majority of the potato growers lost money on their crop the past year, and inasmuch as most of these growers tried to save money by adopting cheap methods to cut down the cost of production, the above outline of methods which produce results may be of some

P&O

Wheeled
Walking Gang
Plows

In adaptability to rigid plowing conditions, where efficiency and ease of operation are combined with great strength and durability, the P&O line is the leader.

Made in two and three furrow with standard P&O bottoms, the same perfect bottoms that go on all P&O Riding and Engine Gang Plows.

"It's the Way We Build Them"

The P. & O. Nos. 3, 4 and 5 Wheeled Walking Plows are especially adapted to use in the West and Northwest. Some of the features common to these splendid plows are: Nearly all steel construction; improved hitch shifting device; conveniently located levers for depth and leveling; wide hitch adjustment; third plow attachment for three furrow; rear wheel attachment with seat, or seat attachment only.

Nos. 3 and 5 have patented adjustable beam braces permitting the use of either of two sizes of bottoms on the same plow. Nos. 3 and 4 have the wheels located to permit easy turning at ends of the field. These plows make good on hillside or level, and the No. 5, owing to its peculiar wheel arrangement, will stick on any hill that it is possible to plow.

value. Is it not good business practice to spend enough money to produce a good crop and make a profit on the investment, rather than use cheap methods and lose money?

W. V. Shear, Sec'y West Coast Potato Association.

SULPHURIC ACID FOR ALKALI.

To the Editor: How much sulphuric acid per acre or per 100 square feet and how should same be applied?—Subscriber, Berenda.

[Methods and formulas have not yet been worked out. We advise waiting for them, for sulphuric acid is pesky dangerous to handle—besides it is now scarce and high priced because of the war.—Eds.]

SAYLOR'S REPORTS ON SUGAR BEETS.

To the Editor: Where can I get Mr. Saylor's reports on sugar beet growing in the United States?—L. S., San Francisco.

[There are several reports by Mr. Saylor, one for each year. They can be had from the Bureau of Plant Industry, U. S. Dept. of Agr., Washington, D. C.—Editors.]

STATE MARKETING AND RURAL CREDITS ENDORSED.

As an indication of what the farmers themselves are thinking of the proposed Rural Credits and State Marketing Plans, we quote from a letter received from E. E. Greenough of Merced. He says: "Mr. Weinstock is surely on the right track, both in rural credits and in the marketing of farm products. If there is anything the California farmers, especially the ones of small diversified farms, need it is cheaper money and a market where they can realize all there is in what they produce. A knowledge of what the market demanded would be a great help in growing the right produce."

PRISONERS ON STATE HIGHWAYS.

Upward of 1000 convicts will be building State highways next spring, according to the plans of Warden James A. Johnston and the State Highway Commissioners. The convict road building system has proved a success in Mendocino county, the warden says. Another party of forty prisoners will be sent to the Mendocino county camps, giving each camp about eighty men. Other camps will be established until approximately 800 men are at work. Two hundred others will be sent out from Folsom into the nearby mountain counties.

FORESTRY HANDBOOKS.

The California State Board of Forestry has just issued two very useful technical bulletins by H. E. McKenzie entitled "A Mill-Scale Study of Western Yellow Pine" and "A Discussion of Log Rules." They are intended for forestry and lumbering experts and can doubtless be secured by such through application to G. M. Homan's, State Forester, Sacramento.

Italian cypress lousy with red spiders or brown mites, found by J. G. Repplier of Banning, prove their need of thorough spraying or destruction to prevent migration of the insects to nearby orchards.

GRAND PRIZE
POTATOES

Result of "Gold Bear Fertilizer" on Potatoes.

790 bushels to the acre grown on

BOA VISTA RANCH

Placerville, El Dorado Co., Cal. (The largest crop on record in the United States.)

The Pacific Rural Press says:

"It is asserted that the average yield for the State is less than 100 sacks per acre. On one large planting last season it was 32 sacks of 100 pounds each."

GRAND PRIZE.

The highest award by the International Jury of Awards at the P. P. I. E. was given the potatoes from Boa Vista Ranch for the best commercial exhibit.

STATE PRIZE.

In the contest for yield, held under the auspices of the State Horticultural Commission, this acre of potatoes was given the highest prize. Mr. W. V. Shear of the U. S Dept. of Agriculture acted as judge.

Gold Bear

fertilizer is always a prize winner.

Mr. E. H. Phreaner, of Boa Vista ranch, says: "Any one of ten acres would have won the prize. The average of 35 acres was 350 sacks, or 35,000 pounds. The potatoes are better type and will give a higher market grade than those receiving less fertilizer."

'By the use of 'Gold Bear' fertilizer the cost per bushel has been reduced, the production tremendously increased, and the quality improved."

Mr. E. H. Phreaner, Boa Vista Ranch, Placerville, California, will be glad to give information in regard to the use of fertilizer for the potato crop.

"Gold Bear" fertilizer paid him and it will pay you. You will draw a prize for a bigger crop, a better type, and a higher market grade.

Mr. Phreaner writes us: "The potato crop is turning out even better than we had expected. The quality is especially fine, enabling us to obtain an average price of two cents a pound for the whole crop."

For the "Gold Bear" Fertilizer book, write to—

WESTERN MEAT COMPANY
SAN FRANCISCO.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

J. S. Jackson has purchased 130 acres of land near Strathmore, Tulare county, which he will plant to navel and Valencia oranges this spring.

Orange packing in the Ojai valley of Ventura county was started last week. The crop there this year is said to be of exceptionally fine quality and good prices are expected.

The Redlands Fruit Ass'n. has a new, up-to-date washer for oranges this year. Only dirty oranges were washed at first, but they came out so much brighter than the best from the trees that all are now washed.

Shipments of oranges bid fair to be the heaviest of the season from the Riverside district this week as the railroads are again able to operate. The total shipments from that section up to February 1 were 500 cars.

Railroads, express companies, hotels and merchants in all parts of the United States are being asked to co-operate with California orange growers in an effort to have oranges on every table, March 18, which has been set as Orange Day.

After three years of mulching basins around orange trees, D. C. Lefferts of Redlands is an enthusiastic advocate of the system. Crops have been increased while cultivation has decreased and he uses only about one-third of the water.

The Crown Jewel Co. is a recently formed association of 34 orange growers who have put up a $15,000 packing house near Redlands, since organization last October and are shipping through the Cal. Fruit Growers' Exchange.

The University Experiment Station at Meloland plans to set dates among their recently frosted citrus trees, hoping that the protection from sun in summer will improve the quality of the citrus fruit, and in winter will prevent frost damage.

One hundred and thirty orange seedling trees, 30 to 40 years old, belonging to M. C. Mascart of Redlands, produced 2,734 boxes of fruit, 82 per cent of which graded fancy and which netted him $2,018 a year. He has picked as many as 37 boxes from one tree.

Mr. R. C. Merryman of Exeter has just returned from Washington, D. C., where he was in conference with officials of the U. S. Department of Agriculture in regard to the 8 to 1 test for oranges. He states that the department is now disposed to do what they can to maintain the standard in question.

In his monthly report for January, C. W. Beers, horticultural commissioner of Santa Barabara, states that the cold spell has not damaged the citrus crop there so far as his office has been advised. The trees are well loaded with bloom, while a splendid setting of fruits promise a crop of ordinary tonage. At this time of the year the lemon grower needs to give special attention to conditions that favor the development of fungus rots about the growing fruits. In very many sections a systematic spraying of the ground under and about the bearing trees is resorted to, with marked financial returns for the expense. It will pay growers to give attention to this aspect of the industry.

OLIVES AND NUTS.

Parties on the Murdock ranch near Orland are planting 70,000 olive cuttings of the Mission and Manzanillo varieties.

Statistics compiled by Chief Deputy Horticultural Commissioner George P. Weldon, give the total bearing olive acreage as 15,642 and the non-bearing acreage as 11,574.

In order to secure larger olives every other tree in a small Mission orchard on the Craig ranch, near Fair Oaks, is being rooted up. The trees were originally 20 feet apart.

A report from Porterville states that there will be 600 acres of olives and 40 acres of almonds planted in the Poplar district this year. Irrigation pipe is now being installed for irrigating the orchards.

It is estimated that 15,000 cases of olives will be packed at the Tulare cannery. Supplies of olives are being secured from Lindsay, the fancy fruit being packed in glass for Chicago buyers. The California Growers' Ass'n will market the pack.

A company of men, mostly from railroad circles, plan on sub-dividing 5,000 acres of land in the Perris valley, of Riverside county. Included in their plan is the planting of a large acreage of olives which will be taken care of by the company till maturity.

GRAPES AND VINES.

As an indication of the feeling in Yuba and Sutter counties about the continuation of the Associated Raisin company, the grape growers there have signed up 5,000 acres with the association during the past few weeks and more meetings will be held before April.

Joseph Di Giorgio, new president of the Earl Fruit company, believes grape growers should plant more

WALNUTS

Highest award at P. P. I. E.

Highest price paid in San Francisco, Los Angeles and New York for our nuts.

WHY?

Because we **specialize** in walnuts and have spent years in improvement. When you get trees from us, you get the best that can be grown. The **cost** of trees is only a drop in the bucket in the cost of bringing a grove to bearing, but the **quality** of the tree is all important.

We have only a few trees left.

Knapp Engine Disc Plow

With this plow you can work within one foot of the trees in throwing the soil from the trees. Built very low, so that no part can come in contact with the limbs of the trees. Will penetrate hard soil and will not jump or swing around. Will turn under and completely cover up any cover crop or foul growth NO MATTER HOW HIGH OR HOW THICK.

WILL NOT CLOG UP IN PLOWING BURR CLOVER OR VETCH, as it has a wide clearance.

NO LEVERS to come in contact with limbs, as the land and furrow wheels are provided with worm-gear lifts, which does away with the levers and makes the plow easy to raise or lower.

TURNS EITHER TO RIGHT OR LEFT, and is steered by the engine as well as by hand.

The seat is in the center of the plow to keep the driver away from the trees, and all operating rods are within easy reach from the seat.

MADE IN ALL SIZES to suit every size and make of tractor.

WANTED

ABOUT
20 Good Farmers
who have the "Pep," are tired of working for others, and wish to acquire land of their own. Land is in Tulare County, between Pixley and Spa, mostly graded and checked, and has been in Rice last year, producing from 30 to 40 sacks per acre. Also good for grain, fruits or alfalfa. Electric pumping plants, reservoirs, ditches and buildings. For rent on shares, or sale on crop basis, on long time and easy terms.
Address: R. C. Fairall, Pixley, Cal., or R. Schiffmann, owner, Chamber of Commerce Building, Pasadena, Cal.

Petaluma, Calif.

Tokay, Malaga and Emperor grapes as we practically have a monopoly on these grapes and if properly graded and advertised these crops should prove very profitable to the State.

Business men as well as growers and officers of the Associated Raisin company are making a strenuous campaign in all parts of the San Joaquin valley for additional acreage of raisin grapes, as it is the belief of everybody that unless the association is supported, raisin prices will revert back to the low standards which prevailed before the organization of the raisin company was perfected.

DECIDUOUS FRUITS.

Fifty acres of the old Spangler ranch near Yuba City is being planted to pear trees by Mrs. Hale, the present owner.

A report from Lompoc states that from the number of buds on the cherry trees there it is evident that there will be a large crop of that fruit in the section this year.

Word has been received from Visalia that the peach growers of that place have decided to join the California Peach Ass'n, thus insuring the association unanimous support in the San Joaquin valley.

A report from Orange county states that a cannery is to be established at Buena Park in the old creamery building at that place. All kinds of vegetables and fruit will be handled and it is the intention to have the plant in operation this year.

The Beaumont orchard district is mostly planted to red apples, but recent plantings and prospective plantings for this spring are mostly cherries. Lamberts, Tartarians and Bings are being preferred. About 2,000 acres of fruit are to be planted.

Steps toward completing the organization of the California Growers' Ass'n were taken at a meeting of that association held at Tulare last week. If the present plans of the association succeed it is expected that it will become the largest marketing association in the State.

Reports from various peach growing sections of the State indicate that packers are endeavoring to make it hard for the newly formed California Peach Growers' association. A dispatch from Fresno says that one buyer has been offering five cents; but that the farmers are taking none of his bait, which is good news. Growers in other sections should take the same stand.

In an address to Sonoma county apple growers last week, President Jerome of the Watsonville Apple Distributors stated that apples sold by that organization last year which were packed under the State standard brought 10 cents a box premium. This State standard may only be used when the pack is put up in what is known as the Oregon box.

Twelve per cent of the prune acreage of Napa county was signed up for the Prune and Apricot Growers' Information Bureau, at a meeting held in Napa last week and members were appointed to canvass the prune growing sections for additional acreage. The organization of the Napa county branch will be perfected at a meeting to be held February 12.

Delicious apple trees 5 years old bear as much as 200 pounds in the Beaumont district according to Sec'y R. N. McCahan of the Beaumont Fruit Growers' Ass'n. He fears Rome Beauty will be too mealy at Beaumont, though it makes the fanciest kind of fruit in the Oak Glen district which runs up to 5,000 feet elevation, 1500 feet higher than Beaumont orchards.

County Horticultural Commissioner C. W. Beers of Santa Barbara county says in his monthly report for January that numerous shipments of fruit trees are being received in every section of the county and that growers have learned the advantage of having enough of one variety to make uniform boxes of peaches, apricots, etc. This means a possibility of entering the market with the highest grades of fruit.

The use of high-grade materials and skilled workmanship always adds to the production cost. But this added cost is a saving. Farmers understand this, and the most careful buyers use Yuba Tractors because they know that on every job on the farm, in every season of the year, the Yuba can be depended upon to perform its work efficiently and economically. The initial cost is more than justified by the absence of delays and breakdowns.

The catalogue tells why—

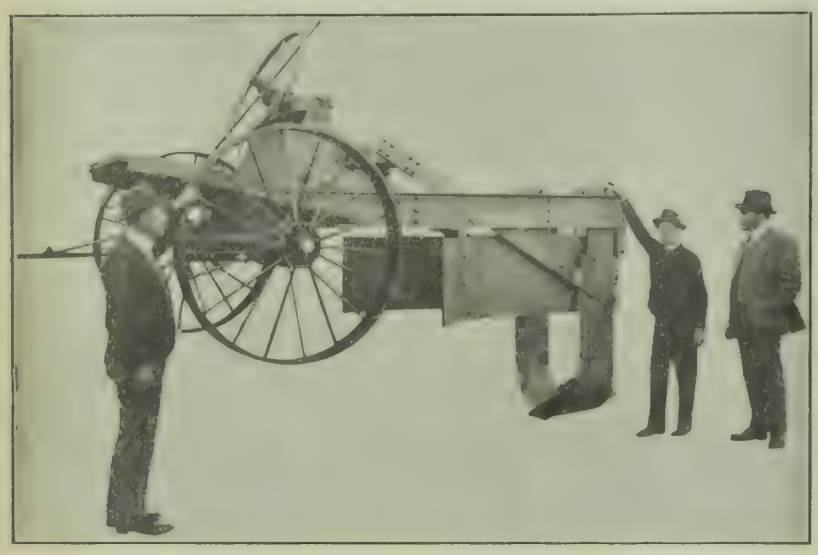
Growers of
HIGH GRADE CITRUS TREES
Oranges Lemons Grape Fruit



We have spent our entire life growing citrus trees. You cannot buy better citrus trees than we offer you. All trees from stock of 1 and 2 year buds, selected with greatest care, and taken from our own grove. Our nursery is located in a clean district—our trees absolutely free from insect pests, 5-8 and up, guaranteed TRUE-TO-NAME. You cannot beat our prices for quality stock.

POLLARD & MARTIN.

Mechanical Power on the Farm.

THE KILLEFER VINE PULLER.

The above picture shows the latest machine invented to pull grape vine stumps of which we gave description in our issue of Jan. 29th. Length of machine over all 15 ft., height 7 to 10 ft; eye beams 12" frames, two flat beams placed together for strength. At the rear will be seen the U-shaped standard with cutting edge that goes under vine stump and both sides. Attached to this standard are two "kickers" that lift vine from ground automatically. The machine weighs 7,000 lbs., and is the largest single implement ever built by the Killefer Mfg. Co. of Los Angeles. The strength of construction was passed upon by a technical engineer, and it the Vina ranch. The remarkable thing about its construction was that the machine went into the field and did the work, without readjustment, that it was designed to do. Mr. Stimmel has added a new machine to California's agriculture.

New Implement for Vine Pulling.

is built strong enough to stand the pull of two 75 h. p. tractors hitched tandem; however, one 75 h. p. tractor pulls it when at work. A Holt Caterpillar tractor was especially designed to pull this machine, having two guide wheels and its bottom covered with steel armor to keep out brush and stumps. This machine and two men will take out four times as many vines per day as will one tractor and twelve men. W. G. Stimmel designed the machine and it was built according to his specifications by the Killefer Company, to remove the vines from the large vineyard of

WHAT SIZE ELECTRIC MOTOR.

To the Editor: Will you tell me how big an electric motor I need to properly handle a one-inch centrifugal pump working against a 50 foot head, that is drawing water 20 feet out of the well, and putting it up in a tank 30 feet high?—W. J. A., Riverdale.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

[The normal discharge from a one-inch centrifugal pump is given by one manufacturer as 30 gallons per minute. The amount of piping is not given so it is impossible to estimate the friction head in the pipe, but if this is estimated to be 10 feet, the total head will then be 60 feet.

The theoretical horse power required to lift 30 gallons per minute against the total head of 60 feet is .52 h.p. It is customary with small pumps of this kind to increase the theoretical power by four; thus, 2 h.p. approximately will be required.]

ELECTRIC WALNUT HOUSE.

[Written for Pacific Rural Press.]

Electricity is the motive power and chemical agent in one of the best equipped walnut packing houses in the West, located at Goleta, Santa Barbara county. It includes graders, bleachers, crackers, packers, and everything needed to put the nuts into first-class shape, for sale by the Calif. Walnut Growers' Ass'n.

Alternating current is received from the "high" line to run a 20 kilowatt motor-generator. This generates a direct current of 140 ampers at 110 volts pressure. The direct current passes through a big "battery" submerged in an 8% salt solution. The salt is mixed with water in a large tank, 200 pounds at a time, and the brine run through the smaller tank in which the batteries are located. Electric action in the batteries liberates the chloride of the salt, which then passes with the water into the walnut bleaching tank.

The bleaching tank is 20x3½ feet and 2 feet deep. Across it at regular intervals are six cylindrical "tumblers" with long spike teeth. These tumblers, run by the 5 h. p. motor,

TRACTOR DISCS (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

Our Engine Discs are built in sizes from eight to twenty feet in width. The Discs are made extra heavy for this class of work, and are stronger than anything obtainable on the market. The arbor bolts are large and all castings are made heavier in proportion to stand the extreme strain required of the Tractor Tools. The Discs are equipped with weight boxes to give the necessary weight to insure the proper penetration on different characters of soil. The pitch of the Disc is controlled by connecting arms bolted solidly in place, but which can be changed to any pitch desired within a radius of fifteen degrees.

which also runs the grader, turn constantly, all in the same direction. Nuts from the incoming wagons are dumped into one end of the bleacher, the tumblers forcing them under the solution and at the same time toward the other end of the tank where they are taken out by an endless chain conveyor two minutes after they entered the solution.

The conveyor takes them high up into the rolling cylindrical grader, which is perforated with holes to separate the Jumbos, No. 1's and No. 2's.

From the grader, the nuts are carried by belts run by another 5 h. p. motor into large "drier" bins with slatted bottoms sloping toward the center a few feet above the floor. The slatted bottoms permit drying of the nuts in about four hours. A blower was installed to hasten drying, but has been disconnected.

The drier discharges onto sloping aprons where girls are stationed to pick out all that are bad, shell spotted, or cracked, putting the cracked ones into separate sacks. The good nuts are conveyed to a packing hopper.

The cracking machine is run by a 2 h. p. motor. Nuts for this purpose are not bleached, but dumped into a hopper, whence a conveyor carries them high into a grader for three sizes. Each size is cracked by itself, being dropped from the grader into hoppers which feed the nuts regularly into the proper crackers. These are each composed of two carborundum disks, one flatwise above the other at the proper distance for the sized nuts. They whirl swiftly in opposite directions and crack practically all the nuts with minimum breakage of meats.

The cracked nuts are run through a fanning mill whence the meats and shells drop onto sorting tables. Girls here get 4 cents per pound for picking out the meats into No. 1's (light halves), No 2's (light pieces) and No. 3's (ambers). The meats are packed into paper-lined boxes holding 23 pounds of halves and a little more of pieces.

The outfit employs at times 70 girls on the grader and cracker. There were 46 girls and five men packing cartons of whole nuts, at once, about 10 carloads of these having been packed in 1915.

About 900 tons were handled last season, in spite of the worst visitation of blight ever experienced. Many of these were packed in bags holding 100 pounds net. Some, packed in 4-pound bags, looked too rough to take well with the trade. The first-class nuts are put up under the Diamond brand; the spotted, but not greatly inferior ones, under the Ruby brand.

PUMPS ARTESIAN WELLS.

[Written for Pacific Rural Press.]

Artesian water seems to be plentiful eastward and south from Coachella, but so many wells are being put in that some people fear a shortage from the shallower strata and are putting wells down to the 1400-foot level. C. F. Steinhardt is one of these. His well cost $2200, but it flows 56 to 60 inches. There are good water strata at 10 to 18 feet, at 100 to 180 feet, at 1000 to 1100 feet and at 1400 feet, according to A. A. Allen. He has a 550-foot artesian well which used to flow about 35 miners' inches, but has decreased so that he will install a 5 h. p. motor and No. 3 centrifugal pump, though it still flows all summer. This will enable him to irrigate the 20 above his well from from it instead of from his neighbor's well, which is already equipped with pumps to be used in hot weather.

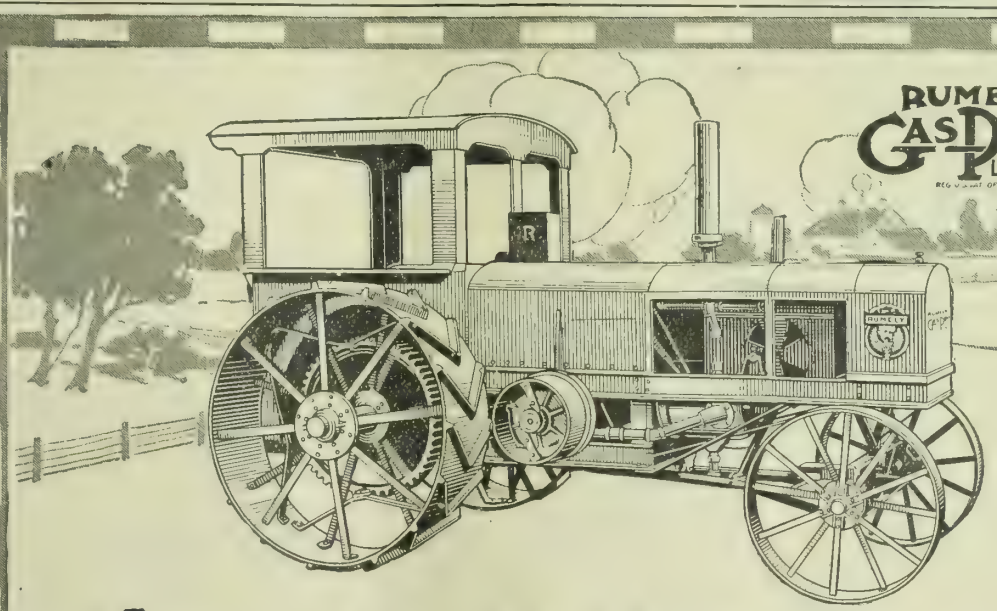
Electricity costs only 2 cents per kilowatt hour, making cheap, convenient light in the home, and costing him only about eight cents per hour for the motor and pump.

It is also convenient for those who cannot stand the expense of an artesian well, since the 100-foot stratum is good reliable pump water.

Keep the dust cloth on the dust trap clean.

Keep your fan belt tight.

Where Good Tillage Pays Work close with the California Orchard Plow



The yield and quality of your fruit depend largely upon the tillage your orchard receives. Choice fruits command high prices. You can't work among the trees and under the branches with ordinary tools. It will pay you big to learn about the

Cutaway (CLARK) California Orchard Plow

Reversible—turns the soil either to or from the trees. Extends under branches. Also made with additional extension, when desired, for unusually wide low trees. The Cutaway (Clark) California Orchard Plow balances right—there is no side-draft. Convertible into a field plow for general farm use. Has Cutaway (Clark) cutlery steel disks, forged sharp. It will improve your fruit crop. One of the many Cutaway (Clark) tools. If not at your dealer's write direct. Write for our free book, 'The Soil and Its Tillage.'

Higganum, Conn.

Money Saved Is Money Earned

THE Rumely GasPull tractor commences to cut down farm costs the first day you put it on the pay roll. The "many job" tractor it has come to be called, and it lives up to its name on the Coast, as in all parts of the country.

Probably the first thing that will appeal to you in the GasPull is its light weight and extreme ease of handling. It weighs only 11,000 pounds and you can turn it on a 15-ft. circle. The convenience of levers, a safety cranking device and dependable foot brake help make operating easy.

The GasPull is equipped with a smooth running, powerful motor, all working parts are efficiently lubricated and fully protected from dirt and weather.

You will find that the GasPull completely fills the bill wherever there is plowing to be done, crops to plant and harvest, loads to haul, grain to thresh, roads to build, or wherever power is required to cut down farm expenses and increase farm profits.

The GasPull is as handy, powerful and efficient on the belt as at the draw-bar. It easily handles a thirty-inch separator to its full capacity. There is, of course, absolute freedom from sparks.

Then there's the price. Without making comparisons here, we can safely say that there is no better tractor value on the market. You'll find that a GasPull will cost much less than the horses or mules it will displace, can be maintained at much less cost and will do more work. Made in one size—15-30 horsepower.

We shall be glad to send you a catalog and full information.

Advance-Rumely lines include Rumely traction plows, the famous OilPull tractor and the new All Purpose small farm tractor, threshers, steam engines, hullers and huskers—all dependable machines and backed by Advance-Rumely service.

CHERRIES AT BEAUMONT.

[Written for Pacific Rural Press.]

Last year more cherry trees than apples were planted about Beaumont, where the red apple has already shown special adaptability. This spring, a greater preference is being given to cherries, according to R. N. McCahan, secretary of the Beaumont Fruit Growers' Ass'n. About 220 acres had been planted between 1909 and 1914 while over 150 acres were planted in the winter and spring of 1914-1915.

This popularity is based on two factors. A cherry orchard of twelve acres was set some twenty odd years ago on the Highland Home ranch at the east end of the "Valley" by H. H. Judson, along with similar plantings of many other fruits. This orchard now belongs to the Grigsby Realty Co. of Redlands and Cecil Gribsby states that the normal crop is 25 tons, though it has produced 35 tons, mostly Tartarians. The orchard was headed some five feet high, and a large proportion of the trunks seem to have sunburned and rotted. Many of the trees have been cut back almost to the heads. The new growth has proved vigorous and healthy, so that last season, in spite of a heavy hailstorm shortly before the fruit matured, a crop of 31,000 pounds was picked.

Good Markets and High Prices.—Cherries from the Beaumont district ordinarily bring one cent premium wholesale over other cherries on the same markets. A large proportion of last year's crop brought 10 cents per pound f. o. b. Beaumont, according to Mr. McCahan. This, on account of their freshness, large size, high color, and mountain flavor; for they are produced at an altitude of over 3000 feet with a background over 11,000 feet high on which snow stays till August.

They have been marketed at Los Angeles, El Paso, and points between. More distant shipments have been unnecessary because, aside from the Highland Home ranch which has its own free water, irrigation has been unavailable until seven years ago, so the rest of the orchards are still young, and the total production small.

The Lambert variety is becoming more pouplar, while there are a few Bings, fewer Royal Annes and Gov. Woods. Early varieties are no object here as fruits are a week later than at Banning, which is 400 feet lower than Beaumont; and three weeks later than Cabazon which is only 15 miles away.

A few Tartarians were shipped in May last year, but practically all were shipped between June 1 and 30.

FRANQUETTE WALNUTS.

[By Prof. L. D. Batchelor, Citrus Experiment Station.]

This old French variety is seen at its best in Central California from San Jose to Santa Rosa. It has also been extensively planted through the northwestern states. The trees are of medium productivity. The nut itself is large, symmetrical, and fairly uniform. The shell is well sealed but thin, cracking open easily. The kernel is light cream colored, of medium plumpness, and of excellent quality approaching the hickory nut in flavor. The lateness of the tree in leafing out and blooming in the spring enables it to avoid the walnut blight to some degree, as this disease is usually spread more readily during the early spring. The thick husk and the protection the nuts receive from the foliage makes the occurrence of sunburn very rare on the Franquette. This sort has had a much more thorough trial than the Eureka and can safely be recommended for much of the central and northern portion of California. In the south this variety is a failure, producing a weak, spindly growth and few or no nuts.

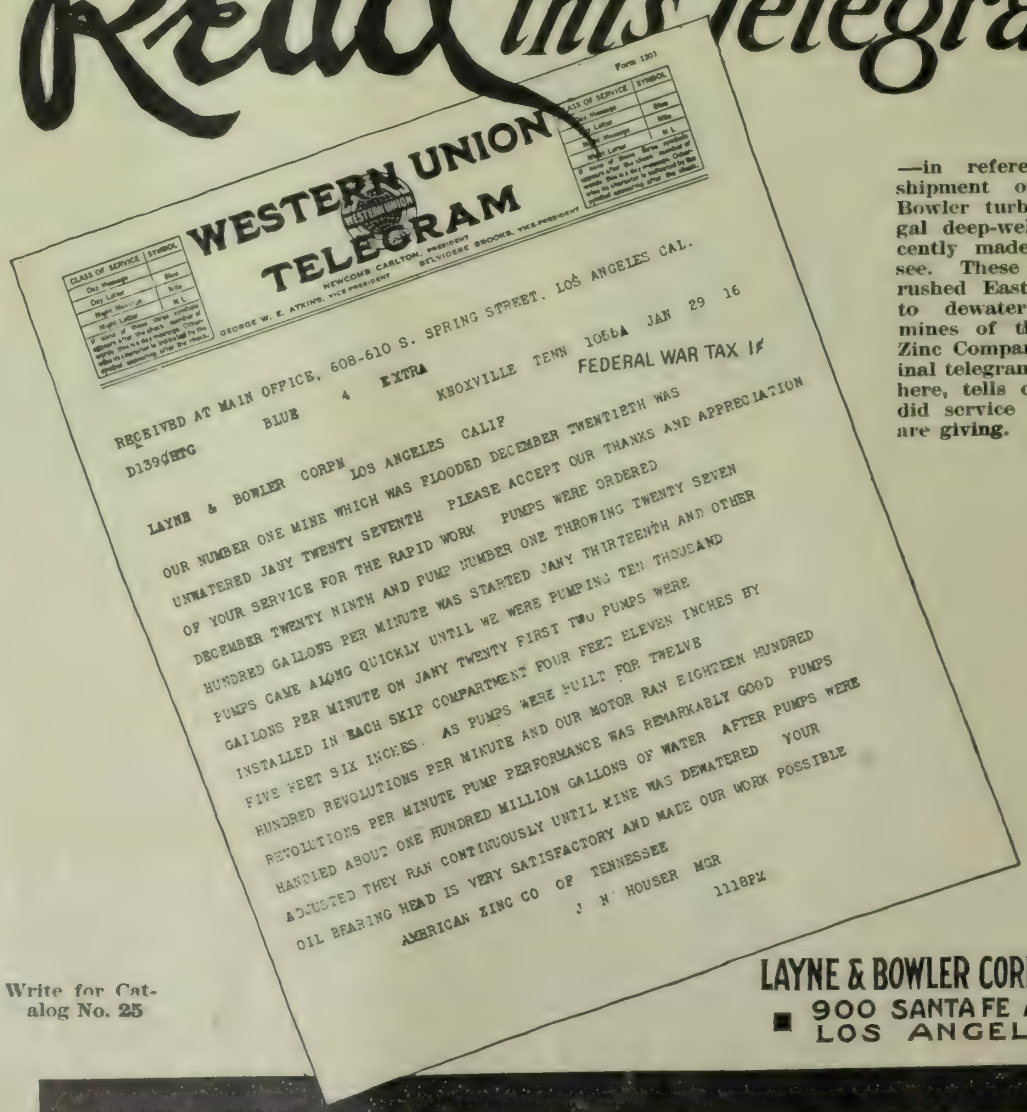
STEEL PUDDLED IRON AMERICAN INGOT IRON

The Iron counts, far more than the Galvanizing!

THE above illustrations, reproduced from actual photographs, tell the story of rust resistance. When new all these pieces of metal looked about alike. After three years' exposure under identical conditions the steel was completely rusted out and the puddled iron seriously attacked. But the third was of the same pure iron from which are made

"ARMCO" AMERICAN INGOT IRON CULVERTS



No rusting out here but a perfect piece of metal. No galvanizing or any other protecting material was used on any of these samples. The elements had free opportunity to attack and destroy them. Only "ARMCO" IRON stood the test. Its rust resistance is due to its uniform purity and the scientific care given its manufacture.

For full information on "ARMCO" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Keeping the Corral Clean in Winter.

[Written for Pacific Rural Press.]

In traveling through the dairy districts at this time of the year one of the commonest sights is to see cows standing over knee deep in muddy corrals. The writer was very much interested in calling at one place in Stanislaus county, recently, where the cows had a dry place to stand as well as protection from the cold winds that have been blowing so bad this winter.

The owner of this herd had built his corral on the west side of the barn and had boarded up the south side for a distance of 30 feet. This boarded part of the corral had a sloping roof 16 feet wide, built over it with the eaves extending well over the sides.

Drainage for the corral was arranged by scraping sandy loam soil from a lower side of the corral. By using a land roller and several barrels of crude oil, he had succeeded in getting a compact surface so that he could run a Fresno scraper over to clean out the manure and he found it was easier to clean than on a wooden or concrete base.

By extending the slope several feet beyond the fence it is not a difficult matter to keep the drain ditch open that carries the liquid manure from the corral to the aflalfa field.

It is the owner's belief that the nominal expense and time expended has been repaid a good many times in the past two years due to the fact that the cows do not fall off so much during the stormy weather. Then, too, he did not have to wear boots every time he entered the coral.

Hanford's Poland China Sale.

In spite of the fact that muddy roads and threatening weather kept many buyers away from the Hanford sale last week, there was a fair attendance, bidding was brisk, and fair prices were obtained throughout. Most of the consignors expressed themselves as being satisfied. While in some cases prices (especially for the better class of stock) did not come up to expectations, they felt they could afford the sacrifices made for the sake of the wide distribution obtained for their hogs. Therefore, the semi-annual sale of the Kings County Poland-China Breeders' Association has been successfully inaugurated. We feel confident that future sales will be even more successful.

There was manifested a specially strong demand for bred sows and there were not nearly enough of these to go around. There was a very large percentage of open gilts, which would undoubtedly have brought 50 per cent higher prices if they had been a month or so older and bred. There was also a rather large percentage of boars.

The one hundred and thirty-five head were sold in a little less than six hours and brought an average of $33 per head. The top price for boars was $125; for sows, $85. Sixteen head brought over $50; twenty-six head from $35 to $50; and seventy-four head, from $20 to $35.

M. Bassett took advantage of the sale to get back a boar that he had sold to Oscar Dimmick before his half brother, Banker Boy, was made Reserve Grand Champion at the Panama-Pacific Exposition and sold to Anita Baldwin for $1000. The price paid was $125, the top price of the sale. The top price for sows was $85 paid for Carnation, bred and consigned by Mr. Bassett. Fourteen head of Bassett-bred hogs consigned by Mr. Bassett and Mr. Dimmick averaged $53.75.

Besides topping the sale, Oscar Dimmick, a Lemoore High School boy, received the highest average price of any consignor; his four head averaged $67.50. Mr. Dimmick's stock showed not only good breeding, but good care and feeding. Quite a number of hogs at the sale were bid in by or for high school students at Lemoore and other places for the Boys' Pig Club Contest.

C. C. West secured four very fine sows, litter mates, consigned by W. Bernstein, at $65 each. Mr. West is establishing a purebred herd at Porterville. C. C. Potter of Lemoore also secured a fine sow from Mr. Bernstein's herd for $47.50. Thirty head consigned by Mr. Bernstein brought an average price of nearly $40 per head.

Warrior Cal., the fifth prize boar at the Panama-Pacific Exposition, consigned by F. D. Ross was bid in at $77.50. R. F. Guerin secured one of Mr. Ross' best sows for $47.50. Nine head consigned by Mr. Ross brought $355, or about $40 per head.

Chief's Laddie, a half brother to Banker Boy, consigned to the sale by Mr. Bassett, was bid in at $75 by T. J. Gilkerson for a company consisting of Thos. J. Woodworth, C. C. Potter, and himself. All these have purebred herds at Stratford, Kings county.

C. H. Christin of San Francisco was one of the largest buyers at the sale. He is establishing a herd on his San Fernando ranch.

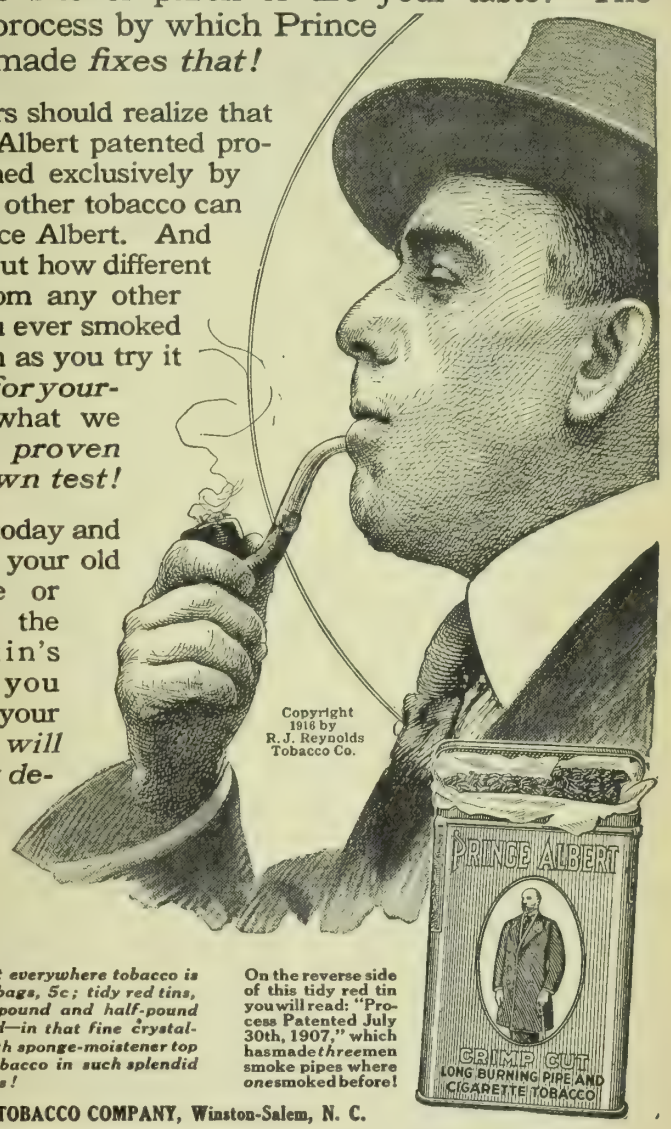
Another large buyer was Otto Muller of Madera. Mr. Muller is subdividing his ranch into 40-acre tracts and stocking each tract with a start in purebred hogs.

The largest consignor to the sale was W. D. Trewhitt of Hanford with 35 head which brought an average of a little less than $30.

Besides being a large consignor to the sale, Geo. A. Smith of Corcoran contributed largely to its success by his very efficient work in the ring.

A decided improvement in the spirits of the crowd and in the bidding was noticeable after lunch, which consisted of 5 roast pigs done to a turn in the ovens of Bernstein's Bakery and served unstintingly and piping hot with beans, etc., on the side.

At the Rabies Conference held in Salt Lake City last week co-operation between various States, federal officials and stockmen's organizations and a federal appropriation formed the keynote of the rabies discussion. An appropriation of not less than $200,000 will be asked of Congress to use in exterminating predatory animals in an effort to stamp out a disease which has been spread through the West by coyotes, wolves and dogs and has taken a serious toll of livestock and even caused the death of human beings.



PRINCE ALBERT

the national joy smoke

puffs its kindly way right into your good will because it is so friendly and cool and fragrant. You may smoke it as long and as hard as you like and it will not bite or parch or tire your taste! The patented process by which Prince Albert is made *fixes that!*

You smokers should realize that the Prince Albert patented process is owned exclusively by us; that no other tobacco can be like Prince Albert. And you'll find out how different P. A. is from any other tobacco you ever smoked just as soon as you try it *and know for yourself* that what we tell you is *proven by your own test!*

Buy some today and smoke it in your old jimmy pipe or roll it into the best makin's cigarette you ever put in your mouth. *It will absolutely delight you!*

Buy Prince Albert everywhere tobacco is sold. Toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and—in that fine crystal-glass humidor with sponge-moistener top that keeps the tobacco in such splendid condition—always!

On the reverse side of this tidy red tin you will read: "Process Patented July 30th, 1907," which has made *three* men smoke pipes where *one* smoked before!

Convenient Economical Milk Barn.

[Written for Pacific Rural Press.]

One of the most modernly equipped, yet inexpensive milking barns found on a trip in Imperial Valley is that of R. D. Stitt near Holtville. It shelters 24 cows in two rows facing outwards; and it cost about $200 for material and labor. The concrete floor, about 16 by 35 feet, reinforced with hog wire and made of a 1 to 5 mixture, cost half of the $200.

Ten vertical 4x6's with creosoted bases two feet in the ground, support a flat roof of chicken wire resting on five 4x6's, which are laid flat and extend three feet on each side beyond the stanchions to protect the mangers. The roof is corner-braced in the end panels and the supporting 4x6's are corner-braced. Old hay is laid over the chickenwire; as Mr. Stitt says, such a roof is much cooler in summer than wood or metal. A wooden fence with gate in the center closes each end.

The gutters slope about 5 inches toward one end, whence the urine and floor flushings drain through cement pipe into a cesspool, which is not included in the $200 cost. The pool is 16 feet deep and 6 feet square, cribbed up and covered with redwood. It is pumped out onto the alfalfa three or four times a year by handpump. Artesian water is used to flush out the barn after milking. Solid manure is hauled to the fields separately.

A unique feature is the canvas protection hung on the north and west sides of this otherwise open-sided barn to protect both the cows and the milkers from blowing dust or rain.

A similar shed in the corral, with no floor or sides, shelters the cows from the summer sun. They rest during the heat of the day and eat at night in summer.

WHY HOGS DO NOT FOLLOW HAMS.

To the Editor: Please inform me who is responsible for the regulating of quotations on farm products and why bacon and hams have been marked up from two to three cents per pound by the wholesalers recently, while the price of hogs on foot is exactly the same as it was previous to the raise.—A. S. P., San Jose.

[The fundamental reason is that packers make the prices on their products and the hog-producer does not, but simply has to take what the packers offer. Probably the packers can give very good reasons for raising their selling prices, and there is nobody to make them see reasons for raising their paying prices.—Eds.]

METHODS OF FATTENING LAMBS.

The University of California has recently completed a six-weeks test at the University Farm in fattening 249 lambs for market. The results indicate that silage, whether made of Indian corn, dwarf milo, or sorghum, can be economically used in a ration which includes barley and alfalfa hay.

Fifty lambs fed on alfalfa hay alone made a daily gain of less than one-fifth of a pound each, yet these lambs ate twice as much alfalfa hay as lambs which were given also barley or silage. Both the latter methods resulted in a daily gain of a third of a pound. The silage fed lambs ate about the same amount of hay as the barley-fed lambs, but considerably less grain.

The quality of carcass of the grain-fed lambs, whether fed on silage or not, was greatly superior to that of the lambs fed only on alfalfa hay. Even if buyers should refuse to make any distinction in price when buying lambs differently fed, although the grain-fed provide much better meat, yet the gain in value over the cost of feed consumed, at the normal prices of barley, alfalfa, and silage, has been proved about the same in feeding silage or barley as in feeding alfalfa hay alone.

HOOF-BRANDING HORSES.

To the Editor: Will you be good enough to tell me if it is practicable to brand horses on the hoof. I understand this is done, in some cases with registered stock, and if the hoof brand does not grow out too fast, it would be preferable to the ordinary brand on the hip or shoulder. Any details as to the actual work would be appreciated.—S. J. F., Kearney Park.

[Hoof-branding of horses is entirely practicable, if done once a year, otherwise it is not, as the hoof grows out and wears off in a longer period and you lose the number.

Irons for hoof branding are made the same as ordinary branding irons, except that the letters or figures are much smaller, say one-half or three-quarter inch in height. A good plan is to have 10 brands, from cipher to nine, in order that you can number as many horses as you desire and give each horse a separate number. After heating in a fire, the branding iron should be placed well up on the hoof of one of the fore legs and allowed to burn fairly deep. Two men are needed, one to hold the horse and the other to use the iron, although there is nothing about the operation which hurts the animal any more than shoeing.—Editors.]

DRIVING MAKES HORSE SICK.

To the Editor: Will you please give me a remedy for a horse that seems to be all right when working in the field, but he gets sick and has diarrhoea when driven on the road any distance? He is also falling off in flesh. I feed him oat hay and a little wheat hay.—E. J. F., Calistoga.

[Give one quart raw linseed oil at a dose, and then follow with one dram fluid extract nux vomica twice a day and two drams naphthalene once a day.]

PARALYZED MARE.

To the Editor: I have a mare that became paralyzed and stiff all at once. She eats and drinks plenty, but very slow. I have been feeding her barley hay with some alfalfa. When she lies down she can't get up. Looks bright out of her eyes and was in good condition when taken with this trouble, but is growing very thin, Has been in this condition about a week. How should I treat her?—T. D. B., Berenda.

[Give one dram calcium iodide twice a day in water, also two drams hexamethylamine in water three times a day.]

The Los Altos Stock Farm sent several Percheron stallions to Ukiah where they will be sold to farmers.

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.
Write for further information, prices. etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

Cows for Settlers on Subdivision Tracts.

(Continued from page 185.)

Second—it furnished the land buyers a good market for their crops and enabled them to make a living and to more promptly pay for their homes. Third—it did a lot of good in educating a few bankers and business men in this kind of business. It resulted in a group of farmers each with a small bank account who paid their bills monthly and who had a little cash in the bank. The land company was benefited by having a few good settlers who, if they could not at once pay for the land, were improving it and paying interest and now are in much better condition to pay up the principal.

A review of this work three years after it was carried out shows that it was successful. The farmers who bought the cows and who have remained on the project have been able to make a living and in nearly all cases have paid for their cows and had a constant market for their alfalfa crop at remunerative prices and are now in a position to more rapidly pay for their land. In some cases it has been possible for them to make substantial payments on their land as well as make a living, and even where it has not been possible for them to pay towards the land the company has been able to collect interest on unpaid land contracts and now stands a much better show to get the principal than before. The position of the owners of dairy herds is in striking contrast to settlers who depended upon the general market for sale of alfalfa, or who went into fruit or vegetables—many of these have run out of capital.

The plan was entered into by the land company not only as a means of helping the settler out, but as an advertising scheme to attract dairymen. The land company has lost a small amount of money loaned to farmers on cows, but the benefits they received have far exceeded the losses. Losses were nearly all due to mistake in judgment of men. In several instances purchasers of land and cattle became discouraged and practically threw up their holdings and turned the bunch of cows back upon the company, causing much of this loss. Had it been possible to judge men better these mistakes would not have happened.

The community in which this experiment was carried out is rapidly becoming an excellent dairy region and the success of dairying has now encouraged bankers and creamery men to bring more cows into the country, and the land company is no longer engaged in this cow business.

This is one example of the practical method of rural credits and it is believed that it is one which many other large land owners in this State might profitably follow.

In carrying out such a scheme it is essential to secure farmers who will stay with the game. Many of the settlers of small tracts have get-rich-quick ideas and a year or two of hard work seems to discourage them. It is essential to have men who understand and like the dairy business. Men have been known to go into dairying whose only knowledge was gained from reading. Such men sometimes get tired of the hard work connected with the business. With real dairymen who have stick-to-it-iveness and soil and water to grow alfalfa there is probably no better method of rapidly developing the country than to loan men, who have feed, the money to buy cows.

The annual report of Secretary G. D. Wolfensparger, of the Nevada state sheep commission, for the year ending November 1, 1915, places the total number of sheep, bucks and goats in the State at 1,029,410, with a total valuation of $3,438,148. There are 1,020,539 sheep, 8,246 bucks and 625 goats. In 1914 there were 910,226 sheep, bucks and goats in the State with a total valuation of $1,839,773, showing a gain in the industry for one year of $1,598,275.

Registered Jacks

Range raised; Guaranteed satisfactory breeders. Field Jacks a specialty. Registered Shire Colts. Will trade for young mules, horses or land.

James W. McCord

Hanford, California.

PEDIGREED HOLSTEIN BULL $250.

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. Her present record is 21.09, made at four years old, but she can make around 25 lbs. with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service.

Write or come and see him.

"Velvet" For Dairymen

West Chester, Pa.

February 3rd, 1916.

Mr. Dairyman:

We have a wonderful new invention and I want to tell you about it myself. It is a source of new profit for dairymen without added expense which I call "velvet," for it is *all profit.*

Thirty-five years, longest in America, the Sharples plant has been devoted exclusively to the Cream Separator.

Its inventors produced the first cream over-flow bowl with its superior quality of smooth even cream, the first directly driven steam Separator, saving power, fuel and wear, the first and only tubular bowl with its doubled skimming force and efficiency and extreme simplicity, the bottom feed, the hanging tubular bowl, all making for convenience, durability, economy of maintenance and operation.

Now we have made another great invention, greatest of all as a profit producer, though so simple that it seems we should have had it long ago.

Thousands of carefully made observations by competent investigators, government officials and scientific men have proven beyond question that 95% of all the hand driven cream separators in America are turned below regulation speed, below the speed marked on the handle, a great part of the time and *every* hand separator is under-speeded *some* of the time.

No matter which separator, whose make, or what it is capable of doing when turned at full speed, it will lose cream and a lot of it, when the speed is allowed to drop even for a moment, and with the cream goes the profit.

THE NEW SHARPLES SUCTION FEED

Separator will stop this loss, aggregating millions of dollars annually to America's dairymen—stop it at once and forever.

No matter if you turn this Separator at widely varying speeds, fast or slow, it skims equally clean—no cream will be lost. The bowl *drinks its milk supply as it needs it,* always in exact proportion to the separating force within the bowl. At slower speeds it drinks less, at faster speeds more, but always just the right amount for *clean* skimming.

A thousand of these machines are in regular daily use; we demonstrated them to a finish before nnouncing them; it is the Sharples way—*absolute perfection before sale.*

The Sharples Suction Feed Separator has several very important advantages in addition to its certainty of clean skimming at any speed. The varying of speed does not change the thickness of cream; fast turning increases the capacity much above normal, just as you whip up a horse, when in a hurry. The supply can is but knee high and the machine throughout is simpler and better than ever.

We sell our Separators now, as always, subject to free trial by the buyer; but a stronger guarantee than any trial is the unbroken record of the growth of this business from the small beginning of 35 years ago to its immense proportions of to-day. It could not grow so except by the unbroken rule of complete satisfaction to customers.

Lack of space prevents explaining more fully; but send today for new book, "Velvet for Dairymen," that tells all about this money-saving invention.

Sincerely yours,

P. M. Sharples

President.

DAIRYING.

The Hutchins Bros. have installed an Empire milking machine at their 30 cow dairy in the Chowchilla district of Madera county.

Several berry growers in the vicinity of Forestville, Sonoma county, are tearing out their vines and expect to go into the dairy business.

E. F. Fottrell, who owns 200 acres on the Stanislaus river near Escalon, has 40 acres checked for alfalfa. He expects to engage in dairying and hog raising.

The annual meeting of the California Creamery Operators' association will meet in Eureka sometime between September 15 and October 1, this year.

The two-year-old Holstein cow Majestic Crane 3rd, owned by the J. B. Harlan company at Woodland, has just finished a seven-day official test with 18,23 pounds of butter.

The Edgewild fruit ranch near El Centro is to be stocked with pure-bred Holsteins from the best families found by its owner on a recent two-months trip in Wisconsin, Illinois, etc.

The owners of the Sanitary Dairy in Imperial county expect to erect a new milk house, equipped with a pasteurization plant and in other ways improve the sanitary conditions of their dairy.

U. Strader reports having sold 14 Dutch Belted heifers and 15 cows to Lloyd Zeigler of Milford Valley, Utah, recently. Also one Hampshire boar to Wm. Thrash of Meridian, Sutter county.

Edward Peterson and John Christensen of Humboldt county have just purchased the 360-acre ranch owned by the Frank Tyron estate in Del Norte county, upon which they will establish a dairy at once.

All stock bought for the 100-cow dairy operated by W. L. Hodges near El Centro was tuberculin tested and did not react. The deputy State Veterinarian did the testing, and will repeat it on the herd semi-annually.

J. D. Huston of Imperial has over 100 purebred Jerseys. One of the herd bulls is a grandson to the brother of the International champion at the last show. Another is a grandson of Stoke Pogis of Prospect.

H. S. Reed of El Centro recently returned from a trip to the Eastern dairy States, where he looked for the reasons for the poor butter heretofore shipped from Imperial Valley. He believes poor cream is the trouble.

A big meeting of dairymen and creamerymen will be held in Eureka, February 26, to discuss the sliding scale payment for milk received by the creameries. A movement is on foot to pay for milk according to the bacteria count in Humboldt county.

According to the daily press the Southern Pacific has just closed a deal with Sir Francis Webster of Glasgow, Scotland, which involves 19,000 acres in the west side of Stanislaus county. The report states that the owner will establish a large dairy on the land and engage in live-stock breeding on a large scale.

The stockholders of the Valley Flower Co-operative Creamery in Humboldt county have decided not to accept milk from turnip-fed cows. The practice of turnip feeding has been generally frowned upon on the ground that it flavors the butter when fed in excess, thus hurting the price of all butter coming from Humboldt county.

The large dairy being established at Palo Alto by Tichenor and Fleishhacker will be one of the most modern plants in the State when contemplated. Loudon stanchions and equipment are being installed and a Calf Way milker will be used. This has promise of being the largest Holstein breeding establishment in the coast counties.

The Henderson Ranch Co. of Sacramento reports that Preciora Sir Crane Hengerveld, a three-year-old Holstein, produced 18.60 pounds of butter in seven days recently. This record was made after raising two calves in 10 months. River View Pontiac Korndyke of the same herd has just dropped a fine 120-pound calf and is giving 80 pounds of milk daily. The sire of this calf is a son of King Segis.

Frank M. Helm of Fresno has sold the holstein bulls, Lord Bakker De Kol and Lord's Zampa Snowflake, to Robt. Hind of the firm of Hind and Rolph of San Francisco. Mr. Hind has shipped them to Honolulu customers. Mr. Helm has 12 daughters of the bull Prince Beauty Pietertje Segis, which he recently purchased from Hewitt and Hewitt, that will be put on test right away. A new testing barn is being erected on his ranch near Fresno and preparations being made to do more official work than has been done with the herd in the past.

SWINE.

Several cases of hog cholera have recently been found in the Farmersville section of Tulare county and immediate steps have been taken to eradicate the disease.

Four carloads of hogs were purchased at Hanford last week for San Francisco shipment. The lot ran from 200 to 250 pounds in weight and netted the farmers 6½ cents a pound.

What is said to be the last car of hogs of the season, left Oakdale last week for the San Francisco market. Like most other California sections the hog shipments from Oakdale have been larger this year than for many years past.

Elmer Lamb of Ceres writes that he has recently received a fine-bred Duroc Jersey boar pig from Watt and Forest, Xenia, Ohio. His sire is Orion Cherry King, Jr., and his dam is by Taxpayer. She is a half sister to the World's Grand Champion boar "Taxpayer 13."

Duroc fanciers should not overlook the Ross sale of Durocs to be held at Modesto Wednesday, February 16, at which time 40 head of sows and boars will be offered at auction. Stanislaus county is already a large "red hog" county and this offering should find a ready sale close to home.

The Imperial Valley Bankers' association are a good bunch of fellows besides being level-headed business men. This is shown by their contribution of $500 in cash prizes for the newly organized pig clubs in Imperial valley. These bankers believe that by promoting the hog industry a great profit will ensue to the entire community. Too bad there aren't a few other bankers so close to "real life" in their communities.

HORSES.

A Los Angeles buyer has just purchased 41 head of mules at Stockton to be used in the sugar beet fields of Ventura county. The average purchase price of the entire lot was $172.

War horse buyers are reported in several towns over the State again, in many instances advertising for as many as 1,000 head. An Idaho buyer is reported to be in Santa Rosa from where he has already shipped three carloads.

A one-half interest in the Percheron horse Carnot has just been sold by W. S. Corsa, owner of Gregory Farms, White Hall, Illinois, for a consideration of $20,000. This is the most notable sale on record in any country and will be of interest to those who saw the get of Carnot which were shown by Mr. Corsa at the P. P. I. E.

SHEEP.

According to P. Connolly lambing is proceeding favorably in the sheep camps adjacent to Livermore despite the bad weather, and the percentage will exceed 100 per cent.

Several thousand head of sheep have recently been taken into the Palo Verde valley in Southern California from New Mexico. They are said to shear about nine pounds. Shearing this year will start about the middle of February.

C. H. Widemann is reported to have leased 2,840 acres of land near Kings City, Monterey county, which he will turn into a large milch goat ranch. He already has several hundred head of goats and expects to have a flock of 3,000 head.

Sheep men who have their flocks in Nye county, Nevada, are said to

Classified Advertisements.

MISCELLANEOUS.

SUDAN GRASS SEED for sale by the rower, direct to farmer at a saving of 60 per cent—less than Seed dealer's prices! Choice seeds; none better. Send in your orders now while it lasts. Greatest forage crop known for dry or irrigated land. Better and finer hay than Timothy. **Wm. P. Spalding, R. F. D., No. 1, Box 64, Los Molinos, Cal.** 30c. lb. small lots; 50 lbs. and over at 25c, delivered.

EXCHANGE—A splendid start for a home. Spokane Valley irrigated orchard in bearing. Commercial apples. Will trade for California property at a bargain. Will assume some. Value $3,000. What have you? Owner, J. L., 1724 Waller, San Francisco.

20 ACRES IN ALFALFA adjoining Kirkman Nursery, near State Highway. Fine pumping plant. S. H. Kunkle, owner, Madera, Cal.

WANTED GOOD FARM, or unimproved land from owner. H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

WANTED TO HEAR FROM OWNER of good farm for sale. Send description and cash price. R. G. List, Minneapolis, Minn.

be losing large numbers, due to the severity of the weather and the heavy snowfall. It is contended by the sheep men that they would not have suffered so badly had they not been held out of the county for some time by deputy sheriffs.

Sheep are to be used as fire preventers in the forest reserves of Southern California if present plans of C. E. Rachford are carried out. Sheep eat off all the small growth in the forests where the fires usually originate and in this way greatly lessen the fire danger. Mr. Rachford states that the reserves are well covered with grass this year and will afford pasture for 20 per cent more livestock than they did last year.

BEEF CATTLE.

Because of the heavy snowfall in Nevada, several cattlemen are said to be in San Joaquin county looking for pasturage for from 30 to 90 days.

The heavy snows in Mendocino county have been the cause of heavy losses of both cattle and sheep during the past two weeks. The loss was not only due to exposure but also to the fact that the feed was covered with snow for some time.

Large numbers of cattle have perished in Clover Valley, Nevada, as a result of the deep snow and severe weather which has prevailed there during the past month. Most of the animals sought refuge in the willows, where they were covered with snow and suffocated.

MISCELLANEOUS NOTES.

Ranchers in the Cuyama and Carissa Plans sections of Santa Barbara county are expecting to plant large acreages of fruit as soon as weather conditions will permit.

Farmers in Lassen and Modoc county have lost 369 head of cattle, seven horses and seven hogs since rabies got across the Oregon state line last fall, not including the losses the last three weeks in January.

Although the principal farm products in the United States were two per cent higher January 1 than at the same time in 1915, prices paid producers of meat were 5½ per cent lower than the year before and nearly one per cent lower than the five year average.

Livestock breeders will be pleased to learn that the directors of the Kings County Fair have decided to hold a county fair at Hanford the coming season. Kings county fairs are always worth while from a livestock standpoint, and stand out by themselves in comparison with some of the other county fairs held in the State in this respect.

LIVESTOCK DIRECTORY.

HORSES AND MULES.

8 JACKS FOR SALE from 1 to 6 years, or will trade for fillies or heifers. We took all prizes for mules at State Fair, 1913. Kelley & Son, R. D. 3, Box 93, Lodi, Cal.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practical and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

YOUNG'S POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

BILLIKEN HERD of registered O. I. C. Swine. Pigs of both sexes from March, April, May and June farrows. Four sires used: Chief Again, Iowa Boy, Missouri Lad and Woodview Earl. All the dams are the smooth, big type. A few bred sows to offer. Everything is cholera immune. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915, I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind. I don't have to auction them off. John P. Daggs for prices, Modesto, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Alvancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

"After driving more than 10,000 miles, I couldn't find enough carbon to fill the hollow of your hand."

That motorist was writing about Zerolene. Practically all who use it have the same experience. That's because

ZEROLENE
the Standard Oil for Motor Cars

is made from selected California crude—asphalt-base.

Zerolene that gets into the explosion chamber doesn't "split up" into gummy, carbon-forming deposits, but after completing its efficient work, is consumed and passes out on exhaust.

Next time you empty the crank case, refill with Zerolene.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

HIDE-BOUND HORSE.

To the Editor: What can I do for a hide-bound horse?—A. N. S., Los Gatos.

[Give a handful of linseed meal in the feed twice a day.]

CAKED UDDER.

To the Editor: I have a dry cow that is going to freshen in about three weeks. One of the back quarters of her udder is caked. What should I do?—E. B., Modesto.

[Rub the bag with camphorated oil twice a day.]

HORSE WITH LUMP ON BELLY.

To the Editor: I have an old horse that has a lump on her belly about six inches long, four inches wide and one-half inch thick. When I push my finger in it it leaves an imprint. She is a good eater. Kindly inform me what I should do.—J. B., Sunset.

[Rub this lump with ammonia liniment twice a day.]

TUBERCULOSIS.

To the Editor: What was the trouble with my cow? She gradually got poor, had no cough, and seemed to have no pain, but died when about seven months along with her calf. I cut her open and found about 20 gallons of water in the womb and bladder. Her liver was about twice its normal size and full of water also.—C. P., Chico.

[This was tuberculosis.]

HEIFER WITH BAD TEATS.

To the Editor: I have a heifer that is due to freshen soon whose udder is quite large, but whose teats are loose and all four contain dark-blackish blood. She was on pasture till about a month ago, and is now fed alfalfa hay and beet pulp. What can I do for her?—W. F. S., Ripon.

[Give this heifer one dram potassium iodine three times a day dissolved in water.]

HORSE HAS SCOURS.

To the Editor: My mare has the scours badly after being driven. She is thin in flesh and dead on her feet. Am feeding the red oat hay with not much grain in it and two gallons of barley a day. Fed alfalfa hay for awhile, but no change. What can I do for her?—B. M. C., Yuba City.

[Give one quart raw linseed oil at a dose, then follow with three 30-grain tablets sulpho carbolates twice a day in feed.]

MAY BE TUBERCULOSIS.

To the Editor: I have three cows. Last spring they each got a lump pretty well back on their jaw. At first I thought it was a fox-tail, but they healed up nicely. Now one of them has it again. It breaks open and runs a little, and then breaks open again. Last spring they just broke open once. Could you tell me what it is, how to cure it, and how to prevent it?—L. S. Reedley.

[Have these animals tested for tuberculosis.]

HORSE WITH SCOURS.

To the Editor: I have a horse that had the scours real bad all last winter, although I gave him a number of things to stop it. I quit feeding him alfalfa and fed only barley straw and rolled barley, but that did not make any difference. Finally I turned him out on pasture, and he slowly got over it. When I took him up last fall I was very careful with alfalfa, but in spite of that he began to be troubled again, and has continued all winter. What can I do for him?—Subscriber, Fresno Co.

[This trouble is due to faulty digestion. Give the colt 2 ounces Epsom salts twice a day, but don't expect to get results quickly.]

TREATMENT FOR OLD MARE.

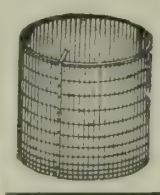
To the Editor: I have a mare about 20 years old that is very thin and is frequently affected with scours. I have had her teeth examined, but she still eats very slowly. She is fed oat hay and gets some green pasture, also rolled barley and bran once a week. She is worked very little and then only for riding. Can you suggest a treatment?—M. D. S., Napa.

[Give this horse six 30-grain tablets sulpho carbolates once a day in the feed.]

MULE'S BLOOD OUT OF ORDER

To the Editor: Last fall I turned my team of mules into a wild oat field, and in about a week one of them took sick and died. There was an irrigation ditch through the field, and there was some tar weed in the field. Had some other horses in the same field at the time that were not affected. Had another mule that had a large swelling on her breast last fall. The veterinarian took her into town and lanced it, and it healed up in about six weeks. In December I discovered an abscess on her throat which had broken. The mule eats and is getting fat. What is the trouble?—J. W. D., Marysville.

[This mule's blood is out of order, and it would be advisable to have her tested for glanders. If she does not react, put her on ounce doses of Fowler's solution of arsenic twice a day.]



SALVADOR STOCK FARM

Shire Stallions

If you are in the market for a Shire Stallion, and wish to take advantage of the fact that I am closing out, you had better do so at once, for they are selling fast. All the young stock is sold, but I still have a few **first-class Stallions** for sale. These stallions are some of the best I ever imported, and include first-prize winners and champions.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered DAIRYMEN AND BREEDERS in California, price and quality considered. Buy one of these bulls and solve your low production problem. White Scours and Bloat Cure.

[Written for Pacific Rural Press by E. E. Greenough, Merced.]

Here are two remedies that I have tried and know to be good. The first one is for white scours in calves. Simply pasteurize the milk thoroughly each time the calf is fed for a month or six weeks and he will never be troubled with scours.

If the calf already has scours, the milk should be boiled and thickened with a little barley flour, or blood meal with a few drops of turpentine added and feed lightly for some time. In fact I think most scours are caused by overfeeding. Four pounds of milk for an ordinary sized calf is plenty at a feed twice a day. I never feed three times, though I think that would be good.

I have used serum for scours and many other remedies, but I find the simplest method is the prevention by feeding pasteurized milk. I never bother to disinfect the navel, either, any more.

The remedy for bloat is so simple that I fear many will not try it. Give one-half or a pint of sweet cream as a drench and in about 15 minutes the gas will be gone. Of course in drenching a cow one must exercise care or some of the drench will get on the animals lungs and cause pneumonia.

I wish some one would devote their life work to contagious abortion. I have lost six calves out of ten this fall, the first I have ever lost. Have secured information from several Experimental Stations, but it don't help much. Have a letter from Dr. Wililams of New York and he says the disease came into my herd with the first cow and will stay till the last cow comes out; in other words, he says the disease is always present in a greater or lesser degree. The remedy he suggsts is the douching of the entire herd at least twice a week during pregnancy and 30 days before breeding, daily washing. Not very encouraging to say the least.

[Comments by Dr. B. B. Wintringham]

[There is no doubt that pasteurization of milk is one of the effective methods of prevention of scours. This may be done by simply turning a steam jet into the milk till it reaches a temperature of 170 or 180 degrees F. and cooling immeditaely to 100 degrees F. and then feeding. The above is efficacious as a preventive only. Painting the navel with tincture of iodine is good routine treatment, as a minor percentage of cases are caused from infection of the navel.

For bloat the most effective cure is to give four ounces each of aromatic spirits of ammonia and spirits of turpentine in a pint of water.

In regard to feeding calves the writer thoroughly believes in feeding small amounts, even four or five times a day, and not larger amounts less often.

Dr. Williams has devoted his life work to contagious abortion and there are many others doing the same today. It is only a matter of time till some effective treatment will be found.]

Balanced Ration for a Jersey.

To the Editor: Could you give me a good balanced ration to go with oat hay, as I will have no alfalfa hay until this summer? The cow is a pure-bred Island Jersey. This is her first calf and has never been fed any grain excepting these last few weeks. She has plenty of good green grasses to run on.—H. C. F., Lincoln.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[Since oat hay has only a medium protein content, it will be necessary to feed the cow a grain ration containing a fair proportion of these components, although it is fair to assume that she will receive considerable protein in the green grass she is eating. Feeding stuffs high in protein are, as a general rule, our most expensive concentrates, like mill feed, linseed oil meal, cotton seed meal, etc. As alfalfa contains a good supply of these constituents it will not ordinarily pay to feed dairy cows high-protein concentrates, except in small amounts to heavy producers, for the sake of stimulating the appetite and maintaining a high milk production. In the case of the Jersey cow owned by the correspondent, I would recommend feeding, in addition to all the oat hay she will clean up, a pound of the following grain mixture for every five pounds of milk she produces: rolled barley and wheat shorts, 2 parts each, cocoanut meal and linseed meal or cottonseed meal, one part each, all by weight. This will make a very palatable grain feed, and with oat and green grass will insure a maximum production from the cow.]

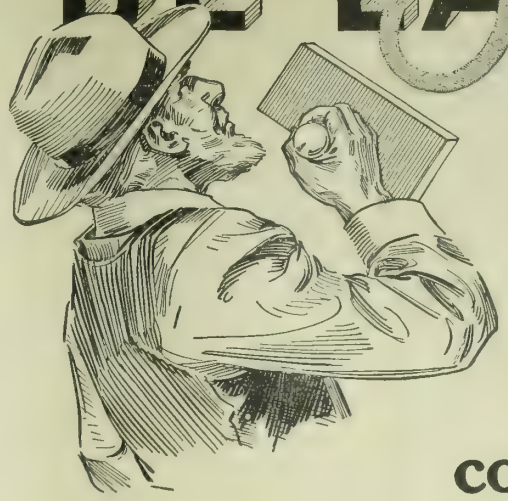
A MAKESHIFT SMOKEHOUSE.

It is not necessary to build a real "house" to provide smokehouse facilities for home curing. A bottomless barrel may be made to serve the purpose.

Dig a little trench into a hillside, making a fire box a foot wide and 8 or 10 inches deep. Cover this with a piece of sheet iron, leaving a smoke hole at the upper end. Place the bottomless barrel over this smoke hole, chimney fashion, lay a stick across the top of the barrel to hang the meat on, put a cover on the barrel so as to keep rain out without cutting off the draft, get a piece of tin or sheet-iron to serve as a door to the furnace, and the smoke house is made.

MARE WITH ITCH.

To the Editor: Since having my mare "fired" for spavin she has developed an itch which causes her to rub herself nearly all the time. Can you tell me how to treat her for this? —J. D. N., Modesto.



[Wash her all over with a one per cent solution liquor cresolis compositus and give her Fowler's Solution in one-half ounce doses, three times a day.]

AN ERROR.

In our issue of February 5, a heading to a query in this department read "Pigs Do Not Have Piles" which should have read "Pigs Do Have Piles."—Editors.

H. C. Hutton has leased a ranch near Paso Robles where he will start a dairy.

DE LAVAL

O.K'd by nearly two million cow owners

MORE De Lavals are being sold than all other makes combined—nearly 2,000,000 are now in use. Year by year an ever increasing proportion of farm separator buyers reach the conclusion that the De Laval is the only cream separator they can afford to buy or use.

In fact, about the only excuse ever offered for buying any other separator nowadays is that its first cost is a little less than the De Lavals.

But they soon find out that the last cost of a cream separator is what really counts, and when they realize that the De Laval gives the most and best service for the money they buy a De Laval.

Over 40,000 users of inferior machines discarded them for De Lavals during the past year in the United States and Canada alone.

Better be right in the first place and start with a De Laval.

Draws Milk In Spurts

THE sucking calf, the hand milker and the Empire Milker all draw milk in spurts. Between spurts the teat is given an instant of rest. Thus there are no ill effects—nothing unpleasant. The Empire has a gentle, massaging, uniform, natural air pressure that really increases the milk flow.

EMPIRE
Mechanical Milker

One double or two-cow unit takes care of 20 to 30 cows per hour. One man can operate two double units. The Empire cuts down hired labor and increases your profits. The Empire is easy to install and to operate, requiring but one tank and one pipe line. Farmers owning prize herds favor the Empire because it cannot injure the stock in any way—cannot cause sore or inflamed teats or udders. Insures clean, sanitary milk, free from dirt, germs and stable odors.

Let us send descriptions and pictures, showing the Empire Milker and Empire Separator in use. We will also send you our offer on Empire Gasoline Engines and Empire Star Feed Mills.

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

TULES IN DUCK POND.

To the Editor: Are tules in a small pond objectionable to raising ducks thereon?—H. M. H., Parlier.

[Unless the tules are so thick as to interfere with the movements of the ducks or so extensive that there is danger of them becoming lost in the growth, the tules are an advantage for the reason that they furnish protection and shade from excessive sunshine. Many breeders fail to supply sufficient shade for their ducks and by this means greatly injure their breeding stock as well as young and growing fowls. This applies on both land and water. It might be stated here that a swimming pool is not necessary for breeding ducks, but when properly arranged it is something of an advantage; young ducks that are intended for breeding may be allowed to swim after they have grown their real feathers, while those intended for eating should never be allowed to get wet beyond their nostrils.]

PROPER PULLET FEED—HOGANIZING.

To the Editor: I am thinking of putting in a few hundred fowls as a side line on a 40-acre plot where they will have free range of alfalfa, a good supply of corn threshings to scratch in, and plenty of grit. Should this be sufficient, and do they need charcoal? Advise me as to suitable feed for White Leghorn pullets ten weeks old and up. I notice advertisements frequently mention "Hoganized" birds. Can you explain this term to me?—R. B. E. D., El Centro.

[If we correctly read between the lines of this inquiry, our correspondent is on the eve of making a mistake that many intending poultry keepers make when poultry is to be a side line. There is a vast difference just raising some poultry as a side line, which often fails, and including poultry culture as one of the real farm crops, which usually pays. When any of us figure on tacking a semi-addition onto a regular business, we just naturally begin to plan some system by which it will more or less "run out and take care of itself"; it is anticipated that it might at times have to be neglected because of the demands of the regular occupation. We feel certain that all experienced poultry raisers will agree with us that this inquirer will derive no profit from a flock of fowls unless more time and attention is awarded them than his letter seems to indicate they are to receive. We do not wish to discourage, but to start him properly—we need him in the business provided he succeeds. To make any real profit from fowls, either on a regular poutry ranch or as a side line, they must be properly—not necessarily expensively—housed, and many recent demonstrations prove that they will not pay a profit unless carefully and intelligently fed. It might be instructive to state here that if the hens are forced to make alfalfa a large part of their feed, the result will be "alfalfa eggs," which sell at several cents below the normal market price. If the "corn threshings" are mildewed or otherwise unsound, they will cause more damage than good. As a means of health insurance, keep a constant supply of grit, broken shell, charcoal, and ground bone before all fowls at all times. It costs but a trifle and saves great losses. Pullets at ten weeks of age require a variety of materials in the feed that promote growth. If one is not able to make up at home a proper mixture the commercial growing mash feeds and scratch feeds are now available nearly everywhere and are usually purchased ready mixed at little or no more than the ingredients cost when bought in small lots. In Jan. 29 issue we explained in detail the meaning of the term "Hoganizing," and stated that we could supply the book, "The Call of the Hen," that teaches this method of selecting breeding fowls.

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

W. R. Thomas, of Petaluma, recently received six White Leghorn cockerels purchased from H. P. Blanchard of New York.

As an illustration of the possibility of the combination of Standard show qualities with high egg-producing capacity, and other utility merits, the report of the judges on the first prize White Leghorn pullet, at the Sacramento poultry show, is noteworthy. This bird scored 94 points in the Standard or fancy class, and by the Hogan test was rated as of 235-egg capacity. This pullet was bred and exhibited by the Mahajo Farm of Sacramento and it is the intention of the owner to reserve for future breeding only his best utility fowls from which finally those also possessing desirable Standard points will be selected the birds for the breeding pens.

We recently mentioned the incorporation of the Fontana Poultry Association. In response to our inquiry for further information, chairman of the Committee on Organization reports as follows: "The primary idea in forming the association was to build up the prosperity of the settlers who have already located about Fontana. A most thorough investigation

fertility of the soil in the groves. It is claimed that the actual fertilizer value from 100 hens is $20 per annum. M. A. Schofield of Gardena will design the poultry houses and appliances and he will devote several days each month to personal inspection of the various plants."

At the late Sacramento poultry show, S. J. Sims of Corte Madera exhibited six specimens of a variety of ducks which he has named the Marin Mallard. These are the result of crossing a wild California Mallard with the domesticated Pekin duck—in the past it has been considered that this could not be accomplished. That it required two years of intimate study of the habits of these fowls, to gain the present results, is evidence that it was a difficult undertaking. To gain this knowledge, in addition to a close observation by daylight, Mr. Sims fitted up joint sleeping quarters for himself and the fowls that he might note their nocturnal habits. The fowls on exhibition consisted of one drake of the first cross, three ducks of the first cross, and ducks of the second cross.

At the McHenry Poultry Yards in Modesto, there has just been installed a 4000-egg capacity incubator; and a new, very modern poultry house, nearing completion, will accommodate 3000 fowls.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

TURKEYS ON THE FARM.

There may be more ideal places to raise turkeys than the hills of California, but if so I never saw them.

To my mind a few acres of hill land covered with live oak and other native brush is a gold mine, providing the neighbors are not too close, for turkeys will ramble, and their rambles usually lead them to a neighbor's place if there is one within a mile or so.

Fences are useful in holding them on one's own premises, if one wing is cut, but this has a drawback, in so far that it leaves the turks at the mercy of animals that like turkey for dinner.

But whether hill or valley land is used, if we succeed with the turkeys we need range, as the birds do not thrive well in confinement.

Hatching.—If you are going to hatch the eggs under hens or under the turkey hens themselves, fairly good results may be had with one-year-old hens and an older male, but for incubator hatching you will need two-year-old, strong turkey hens and a young vigorous tom.

If they have been raised on the premises they should be laying ere this and the only reminder you will need is to be quite sure you have the hens free from lice, as this is the first real menace to turkey poults. Dust the hen thoroughly, when you set her, then again in ten days and again before the hatch comes off. It is also a good plan to put a gunny-sack, folded in the nest, well sprinkled with coal oil. This is to prevent mites from attacking the hen during her term of incubation.

After sprinkling the sack, put a layer of straw or hay over it and put in a decoy egg as an inducement for the turk. She may decide to have none of your nest and make her own, but even so, you can make the same rule with her own nest, but try to leave it looking as much like she left it as possible, then she will stay with it.

Don't be too fussy. Leave the hens as much to themselves as is consistent with cleanliness, but don't stop short of that if you want to raise what you hatch.

Using Incubator.—If the eggs are to be incubated, start the machine at 102 and keep it there till the last week. Give the eggs plenty of time to air, always remembering that a turkey egg is thick through and it takes longer to cool through than hen eggs do.

During the last week supply what moisture is needed, the weather is your judge of that, so work accordingly.

ADVICE TO BUYERS OF POULTRY.

To the Editor: Kindly tell me where I may get 100 White Leghorn baby chicks, not fancy, but pure and well bred up for laying purposes; and two settings of turkey eggs from strong hardy stock—not from extra fine turkeys. Please let me hear right away if I can order these through you, and the price.—Subscriber, Danville.

[In the letter sent by the publisher, in reply to the above, we suggested that it include the following statements: "If you will write to our advertisers and state to them just what you want we think you will get satisfactory prices and good stock. It is usually best to trade with those nearest to you. Turkey eggs that are very cheap are likely to be from rundown, inbred stock that are dear as a gift. In writing to advertisers state clearly what you want to buy; and it often results to the inquirer's benefit to frankly mention what price or about what price he expects to pay." This last statement is not likely to receive the endorsement of the majority of intending buyers, but we can say with confidence that in many cases—almost without exception—a breeder will go out of his way to serve a prospective customer who follows this course and often send fowls or eggs worth more than he should supply and be just to himself. It is a safe plan—try it. In rare instances one may get stung with a little extra sting by being so frank. There are always a few sharpers getting into poultry, but not as many as in other lines, and they do not last long at their game under present conditions. The poultry associations now make short work of them.]

Carl Robertson, the tester for the Gridley Cow Testing association, reports for the month ending January 31, that the organization took in five new members and tested about 700 cows.

Poultry Breeders Directory

GET YOUR DAY-OLD CHIX FROM ACTUAL PRODUCERS, who know what they have and who can stand back of their chicks. We are utility poultry raisers and our White Leghorn chicks this year are from pen of 635 that averaged 171.2 eggs each last year. Our Rhode Island Reds are also heavy winter producers. Owing to superior transportation facilities in Sacramento, quick delivery is assured. White Leghorn chicks, $12.50 per 100; Rhode Island Reds, $15 per 100. Book at once. Brooke Farm, 807 J St., Sacramento.

WHITE LEGHORN BABIES and Hatching Eggs from Hoganized heavy-laying strain. Correspondence solicited. The O. C. McDonald Poultry Ranch, King and Jefferson, San Jose, Cal.

WE OFFER 10,000 R. I. RED CHICKS during Feb'y at $12.50 per 100. Lots of 1000 or more at $12. Also 4500 Barred Rock chicks at same price. 8000 White Leghorn chicks at $10 per 100, or $90 per 1000. All of these are pure-bred high-class stock. These prices are special to secure early orders. Write us your wants today. Free 65-page catalog. Pioneer Hatchery Co., 620 S. Spring St., Los Angeles, Cal.

MRS. BEST'S BULLETIN

My Dear Friends: In my weekly romps among the "shops" (no one who pretends to be ultra-knowing ever speaks of them as stores, but privately the only difference I see between a "shop" and a store is that a store doesn't waste a great deal of money on Circassian walnut fixtures) in my weekly romp among the shops I find that the box coat isn't to be sneezed at. 'Twill be worn very much with suits. Some figures look bewitching in that kind of coat.

The new styles are bringing out more inquisitive lookers every day. And the husband of a friend of mine who has been ill told me that his wife is convalescent. The way he found out is that she asked what hats are going to be like and whether the windows were showing the really new ones.

I understand that turbans of tiny white feathers have returned to fashion. I've seen some white hats trimmed with kid flowers.

But I didn't look so much at modes this week as at odds and ends. Saw bargains in satteen-covered, prettily figured and quilted comforts at $2.50.

Tin pastry tubes or rather syringes—for filling cream puffs, making borders of mashed potatoes, etc.—I saw at 50 and 75 cents; a really handy kitchen utensil for those who go to any "fixing."

The first one I ever saw was a cane top library table in weathered oak. The cane was in four panels. It was $81.50. I should say that such a table would be easy to dust but difficult to lay your loose pearls upon.

Baby has to be in fashion nowadays too. New patterns in baby goods are shown. One is rather fascinated at a nicely embroidered baby coat at $1.50. A bath set in cream enamel was decorated with buds in pen painting had everything a baby that doesn't mind a bath could desire. The price depends upon the amount of accessories. A cariole at $10.50 could serve for cot and playground for a small and not too athletic baby.

They have imported a stationery in bond linen, the envelopes being lined with wall-papery, or at any rate very eccentric, opaque paper. The specimens vary immensely in the pattern of paper and the shapes.

Many of the new gowns are decorated with a bar of silver or gold lace, or lace in metallic colors in conspicuous designs. The taste is cleverly displayed by using just the right amount of this trimming.

And as I have used just the right amount of space to the taste of the editor, I had better stop before he gets to trimming. So I'll remain, as ever, devotedly, **Rosabella Best.**

(Note—Readers wishing information from Mrs Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

SALAD COMBINATIONS.

Candied cherries, pineapple, bananas.

Celery, sweatbreads, olives, pineapple.

Chopper green peppers, celery, pineapple, pimentoes.

Oranges, bananas, white grapes, chopped almonds.

MY LITTLE BOY'S DRUM.

By Fred Schaefer.

My little boy has a red, red drum,
And his red cheeks the redder come
As he raps it and taps it with his might
Up in the morning early and bright,
Like a Continental band.
His thoughts are alive and his hands aren't still,
He imagines he's drumming at Bunker Hill;
He thumps the hide with his two sticks
And his heart it sings like 'Seventy-Six
And Freedom in the Land.

Breakfast can wait, with its codfish balls,
Heroes don't hunger while Liberty calls,
They scorn to halt if the drum's
So let the foe and the biscuits shoot—
With duty to be done.
The martial thoughts of long ago,
The red, red drum, and the cheeks aglow,
Of my little boy go leading where
The army crosses the Delaware,
With him—and Washington!

CAKE BAKING HINTS.

Too often cakes are ruined in the baking. After the batter is properly mixed an important step in the process of cake baking remains. If the oven is too hot the cake will have no chance to rise.

A good rule in baking cake is never to let the oven be hotter than you can hold your hand in. The heat should be such that it permits it to rise before it hardens by baking. If the oven is too hot, the cake not only will harden too quickly but may burn before it is baked. With the oven at a heat as suggested an ordinary cake will require about 45 minutes to bake.

If cakes burn on the sides and bottom, the bottom of the oven is too hot. This can most often be remedied by slipping an inverted pie pan under the cake pan. This does not make the bottom of the oven less hot, but it provides a thin cushion of air under the cake pan that modifies the heat.

THE WEEK'S BEST HELP.

To wash windows or glassware, put a teaspoonful of ammonia in the wash water and see them shine. It gives the cleaned surface a particularly brilliant lustre.

A FLOWER POT COOLER.

A home-made refrigerator that will take care of a pound or two of butter efficiently may be made of a flower pot. Select a large one and set it over a plate containing the article to be kept cool, and swathe the pot in a wet cloth. The evaporation of the water from the cloth keeps down the temperature inside the pot.

EXPERIENCE EXCHANGE.

One of the Home Circle friends just from the East says that a New England firm, catering to the passion for embroidering and fancy work, is putting out dimity bedspreads stamped with any appropriate design. The design, say of a basket of flowers, is worked up by buttonholing pieces of fine chambray to the sections of the design.

Replying to Miss H. D. C., Bakersfield: Waldorf salad is probably the most popular American salad. It is made of apples, celery and nuts, equal parts of finely cut apples and celery. Nut meats, usually walnuts, are added to taste, not very finely cut. It may be served with mayonnaise or cooked dressing.

Who has a copy of those verses: "The Gypsy's Warning," an old favorite?

CLEVER IDEAS.

After the stems of poinsettias are cut, searing the end with a hot iron prevents the loss of the milky juice and prevents the flowers wilting. It is in this way that poinsettias are prepared for shipment.

For the baby in the go-cart a length of eiderdown 20 inches wide and 60 inches long laid in the cart and folded up over baby's feet will keep the little one warm. Hooks and eyes may be sewed on the sides to keep it fastened snugly.

Some of the most popular woman's garden clubs hold seasonable flower shows. Some such clubs also conduct semi-annual flower exchanges at which members barter or give away plants.

SALMON SALAD.

(This Week's Preferred Recipe.)

Heat one can of salmon in boiling water until it is thoroughly warmed; open can, pour off the oil and put salmon into a deep bowl; break it up and add a tablespoonful of hot vinegar. (This is so that the vinegar will permeate the flesh.) Now take one egg, level teasp. ground mustard, ½ teasp. pepper, one teasp. sugar, small lump of butter (about ½ oz.), and warm them together to thicken into a sort of dressing. When cool add 5 tablesp. of cream, and mix all with the salmon.

1916 VALENTINES.

As an institution, Valentine Day, February 14, seems to hold on well in spite of the proneness of people to become tired of anything. However, high-water mark in the craze appears to have been passed some years ago.

This year there seems to be a striving among manufacturers for keeping up interest with more departures from the old styles of greeting designs. The celluloid and fringe affairs that looked so much like confections are quite absent, while there seems to be an effort toward more wholesome devices.

The tendency is more toward cards. The wording is not so extravagant as formerly, either. A simple line or two seems favored, such as "With Love," "A Message of Affection," and so forth. Of course the heart motif is generally adhered to in the decorations.

A novelty is an embossed lithographed design in cut-out form embellished with puffed tissue paper effects of considerable ingenuity, such as forming the skirts of a girl, or the foliage of a palm tree, or a heart. The result, though, is quite tawdry.

A neat thing is a little booklet with illuminated cover and the inscription: "A Directory of People Who Love You." Inside the pages are all blank, the joke being that no one loves you.

There are some specimens of the comic valentine reappearing.

They can be dismissed with the one word, Horrible!

TREES FOR THE HOME.

By Sunbonnet Sue.

I like the house with trees.

What is more a blessing to the eye than a white home peeping forth from a garland of green trees?

Trees grouped about the home speak of contentment, stability, devotion and peace.

There is a comradeship between a house and the trees that are by it; the comradeship is like that between man and a mastiff; the trees stand on guard full of respect and affection.

There is a beauty in trees hugging close to a homestead; theirs is the symmetry of nature contrasted with that of human ingenuity. At the same time they soften the prim lines of the building.

Strange as it is to say so, the trees about a house are what give it the last, the convincing touch of the human.

An abode without the friendship of a single tree looks ghastly.

When I see a rich plain dotted with farmhouses, the gaze turns gratefully to those with a frame of sweet foliage. But the raw, bare house without the sign of a leaf about it sickens the soul of a beholder with hopelessness.

Give me the home with trees about it and warm hearts within.

But him who lives on the plain and scorns the majestic comradeship of a tree he could plant, him I would condemn to the paved city with its narrow, sterile streets.

Berkeley, Cal.

COUNTERWEIGHTS.

Rhoda Barrett, staring out of Miss Betty's window, spoke suddenly after a long silence:

"How one-sided Mary Frey is growing! Don't you see it? Seems to me there's something the matter with almost everyone. Sometimes I get so I hate to watch people."

Miss Betty peered out over her knitting—not that she needed to see Mary Frey, but because it gave her another moment for thinking. Rhoda Barrett's strong young back was straight and supple as a sapling, but there were hard and bitter lines in her face. They had been troubling Miss Betty for two years.

"Life just traps you!" Rhoda said fiercely. "It isn't fair. Look at Mary Frey! She used to be pretty. It's the hard times she's had taking care of that cranky old aunt and doing that endless washing to keep soul and body together."

"And carrying her bundles always on her left side," Miss Betty said musingly. "I spoke to her about it years ago, but she thought it was nonsense. And now she thinks it is nonsense to try to correct it. But I notice she's mighty careful about that Emmeline Murtland that she's got working for her. She told me once that she makes her stop and rest and carry her bundles different ways. Mary Frey takes care of other folks if she doesn't of herself. I expect that's what has kept her soul's spine straight if her body isn't."

"What in the world do you mean, Miss Betty?" Rhoda asked.

Miss Betty laughed, and picked up her knitting again.

"It does sound ridiculous, doesn't it?" she returned. "I was thinking of the way we carry burdens on our hearts and minds. There are folks, you know, that carry them so they are always rubbing in the same spot till it gets so sore or they get so bent that it's almost hopeless to try to help. And there are other folks that have a knack of shifting the load and resting between, or mebbe taking exercise to correct things. And they keep straight and strong—like Delia Fairlane."

"There are some things that can't be shifted," Rhoda returned shortly.

"Delia Fairlane," Miss Betty mused, "seems to do it by a system of counterweights, as far as I can make out. For every new burden of her own she takes a new one that belongs to some one else on her heart. She says they all help her to understand other folks, and even if her hands are tied up, her thoughts don't need to be. So she's keeps her mind balanced. You couldn't possibly be sorry for Delia, because she never seems to have time to be sorry for herself."

And this time Rhoda said nothing. —Youth's Companion.

LUTHER'S CREDULITY.

"I told Luther Woggle, the other day," grinned a citizen of Petunia, "that old, old story about a feller who was in a rubber boot factory when the building was burning. He put on the smallest pair of rubber-boots he could get into, and then a bigger pair, and so forth, until he had nine pairs on, and then jumped out of the sixth story window into the street, where he bounced up and down until his friends had to shoot him to keep him from starving to death. I told that yarn to Luther and he actually believed it. But, then, Luther believes that an army of a million American farmers with pitchforks could whip any sized host of foreign invaders, and a man who believes that will believe anything." —Kansas City Star.

THE MAN IN THE MOON.

One Sunday morning an old man went to a forest and cut a faggot of firewood and put it on his shoulder and began to trudge home. But an angel came and said to him:

"Do you know this is Sunday on earth, when all men rest from labor?"

"Sunday on earth or Monday in heaven," said the old man, "it's all the same to me."

"Then," said the angel, "as you do not keep Sunday on earth, you shall live in a Moon-day in heaven, and there you shall carry your faggot until the day of judgment."

And the old man rose up to the moon and there, on a clear night, you can still see a great shadow, as of a man with a faggot on his shoulder. It is said that:

The man in the moon
Came down too soon,
And asked his way to Norwich.

But there was no news of his ever arriving at that great and famous city.—"Legends of Town and Country."

A Definition.—"Pa, what is affection?"

"Affection, my boy, is carrying three extra tires on an automobile that never gets more than four blocks away from a garage."—Detroit Free Press.

"I Told You So's" Rival.—Whenever we hear a man start a prophecy with "mark my words," we know instinctively that we are in for something unpleasant.—Philadelphia Inquirer.

Making it Clear.—After a man marries and settles down all he has to do for the rest of his life is to settle up.—Boston Transcript.

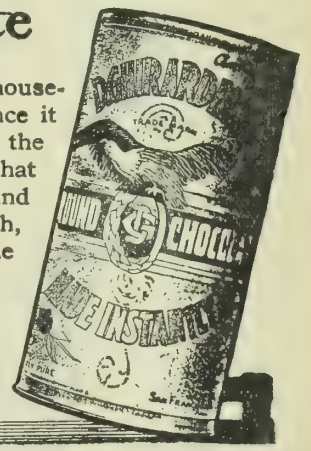
That for a sprained ankle, holding the foot in water as hot as you can bear it is the best relief?

Prepare Now for Spring Building

And build with your spare time. With our plans and your hammer, home-building is an easy matter. We furnish everything — material machine sawed and numbered to fit. $205 buys a completed home — one that you can build yourself, and be proud of afterward.

Just follow our plans and a permanent, substantial, and attractive home will be yours. Your own ideas carried out for any size or shaped house.

Catalog awaits your postal —send for it today.



Ready Built House Co.
973 Broadway, Portland, Ore.

The Grand Prize, the highest award, bestowed upon Ghirardelli's Ground Chocolate by the Panama-Pacific Exposition, San Francisco 1915, is an additional testimonial to its unquestioned supremacy. The expert judges in this international competition found in

Ghirardelli's Ground Chocolate

the very qualities that have made it a household favorite on the Pacific Coast since it was originated by D. Ghirardelli in the early seventies. Not to know—and what is more, not to use—Ghirardelli's Ground Chocolate, is to be unmindful of health, economy and the appeal of a wholesome appetite.

Now is the time to sow California Poppy seed. Special offer for one week only: upon receipt of 25c I will mail you my regular 50c collection of California poppies, consisting of 9 distinct varieties in separate packets.

THEODORE PAYNE,
345 S. Main St., Los Angeles.

The Markets.

Unless otherwise noted, prices quoted are f. o. b. San Francisco.

San Francisco, Feb, 9, 1916.

WHEAT.

The Eastern market continues strong on export buying, and supplies on the Coast are pretty firmly held, but the local demand is light, and there is hardly as much strength in this market as last week.

Cal. Club, ctl.	$1.80 @1.85
Northern Bluestem.	1.97½ @2.02½
Northern Club	1.85 @1.87½
Northern Red	1.85 @2.05

BARLEY.

Values show no quotable change, but there has been a little reaction from last week's advance, notwithstanding a lively shipping movement East. The local demand has been less active,, but most offerings are steadily held.

Shipping, ctl.	$1.40 @1.45
Choice Feed, ctl.	1.37½ @1.40

OATS.

White feed oats have eased off a little from the recent advance, as supplies are coming in more freely. In view of the demand for shipment, however, the situation seems to be strong.

Red Feed	$1.35 @1.37½
Red Seed	1.45 @1.65
White	1.50 @1.55

CORN.

No change is noted since last week. Eastern corn is steady, with about the usual routine business, while the sorghum grains are in good demand for feeding.

Eastern yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.65 @1.70
Egyptian	1.50 @1.55

BEANS.

Business continues quiet. Supplies of all varieties are by no means heavy for this time of year; in fact, some varieties are quite scarce; but with no urgent demand at present in any quarter, occasional efforts to sell cause an easing of prices, and slight declines are noted on blackeyes and small whites. Offerings in the country now consist quite largely of very small lots, which it does not pay local wholesalers to handle. Such lots would hardly bring full quotations in the city, and can better be disposed of in the neighborhood where grown, unless enough can be collected to make a carload of similar grade and variety.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.90 @5.00
Blackeyes	3.50 @3.60
Cranberry Beans	4.75 @4.85
Horse Beans	3.25 @3.50
Small Whites (south)	5.70 @5.80
Large Whites	5.75 @5.90
Pinks	4.30 @4.40
Limas (south)	4.50 @4.60
Red Kidney	6.50 @6.75
Mexican Reds	4.50 @4.65
Tepary Beans	4.00

SEEDS.

General garden seeds are now moving in good shape, but the lines quoted, except for alfalfa, are rather quiet, values showing little change.

Alfalfa, per lb.	19 @20 c
Melilous Alba	30 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

The results of last week's storms in the south, with continued storms in Oregon, Washington and Nevada, have caused a heavy demand for hay all over the Coast, as cattle everywhere have to be fed, and this market has the only large supply ready for shipment. Orders have accordingly been piling in all week, and as a result prices have advanced. Outbound shipments both from here and from country shipping points have been very heavy both by rail and sea. The heavy reduction in stocks is expected to result in further advances. Alfalfa is closely cleaned up and firm.

No. 1 Wheat	$13.00 @15.00
No. 2	11.00 @13.00
Tame Oats	11.00 @16.50
Wild Oats	12.00 @14.00
Alfalfa	13.00 @16.50
Stock Hay	10.00 @12.00
Straw, per bale	.25 @ .40

FEEDSTUFFS.

Bad weather all over the West has tended to keep the demand for feed quite active, and practically all lines are moving well. The only change in price this week is a slight advance in bran.

(Wholesale prices per ton,. carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.00
Alfalfa Meal, per ton.	20.00 @21.00
Alfalfa Molasses Meal per ton	21.00 @22.00
Bran, per ton	26.50 @27.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	39.50 @40.50
Middlings	33.00 @34.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

VEGETABLES.

Conditions show little change, adverse weather conditions greatly curtailing the supply of desirable stock, while now even ordinary offerings are not over-plentiful. The poor stuff, however, moves slowly, and prices accordingly still show a very wide range. Cabbage is higher, while cauliflower will hardly bring the old top price. Rhubarb does very well, and is in fair supply. Sprouts are higher. String beans are out of the market, and hardly any good peas are seen. Cuba and Florida eggplant is higher, and southern peppers and tomatoes are firm. Artichokes are higher, and celery is held at extreme prices, while ordinary offerings of lettuce are easy.

Cabbage, ctl.	50 @60 c
Cauliflower, doz.	50 @75 c
Sprouts, lb	5½ @6½c
Rhubarb, box	1.25 @2.00
Peas, southern, lb.	10 @12 c
Peppers, bell, lb.	15 @25 c
Tomatoes, L. A., crate	1.75 @2.50
Eggplant, lb	20 @25 c
Celery, crate	3.00 @4.50
Artichokes doz.	.75 @1.00
Lettuce, small, crate	1.00 @1.50

POTATOES AND ONIONS.

The feature in this weeks' offerings is a lot of Bermuda type onions from the River district, which sell readily as quoted. Sweet potatoes are scarce and have advanced sharply. Oregon and Salinas potatoes are also a little higher.

(On Wharf.)

Oregon Burbanks	$1.60 @2.00
Salinas Burbanks	2.00 @2.15
Delta Burbanks	$1.10 @1.65
Sweet Potatoes, ctl.	2.25 @2.50
Onions, Delta, ctl.	1.85 @2.25
Oregon	2.00 @2.50
River Bermudas, crate	2.00 @2.15
Garlic, per lb.	10 @12½c

POULTRY.

The market has picked up well in the last few days. There is plenty of stock coming in, but there is a much more active demand, especially for local stock. Dressed turkeys are doing a little better, and both large and small broilers have advanced sharply. Young roosters and fryers also have been marked up a little.

Turkeys, dressed	27 @28c
Live Turkeys, lb.	22 @23c
Broilers, 15 lbs. to doz. and less, lb.	35 @38c
do, over 15 lbs. to doz.	25 @30c
Fryers	24 @26c
Hens, extra, per lb.	17 @19c
Small	17 @18c
Smooth Young Roosters, per lb.	20 @21c
Squabs, per doz.	2.00 @4.00
Geese, per pair	2.25 @3.00
Ducks, young, lb.	18 @19c
Old	14 @15c
Belgian Hares	9 @11c

BUTTER.

Very little change was recorded most of the week. At the moment, however, a rather close cleanup of offerings has sent extras up a little, and prices are considerably higher than a year ago.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	30½	30	30½	30½	30½	32
Prime Firsts	28½	28½	29	29½	29½	29½
Firsts	27	27	28	28	28	28

EGGS.

Prices went up sharply at the end of last week, as the stormy conditions at other Coast markets diverted shipments elsewhere, and delay in the arrival of Eastern stock also shut off the supply of cheap Eastern stock. Many small producers in nearby districts were also shut off from the market, and are now sending in large quantities. The Eastern shipments also are arriving, and prices have dropped sharply since the first of the week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	35	37	39	32½	33	29½
Sel Pullets	33½	35½	37	31½	32	27½

CHEESE.

Expected offerings of Monterey cheese have not shown up, and the price is rather high. Flats are easier with a ½c. drop.

Y. A.'s, fancy	17½c
Fancy Calif. flats, per lb.	16½c
Monterey Cheese	18 @19c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	32	32	33	33	33	33
Eggs	30	30	37	37	30	30

DECIDUOUS FRUITS

Values show no quotable change. The demand for apples, however, has been considerably better locally for the last few days, and a good many substantial shipping orders are also reported from outside points.

Pearmain	.65 @1.00
Greening	.65 @1.00
Baldwin	.75 @1.25
Oregon Spitzenbergs	1.50 @2.50
Jonathan	1.25 @1.75

DRIED FRUITS.

The spring buying movement in dried fruits has not yet appeared to any great extent here, and it does not look as if there would be any very heavy movement this spring, as the supply remaining in the country is light. Many of the individual offerings, also, are small, and unless of particularly desirable quality are of less interest to buyers than larger lots, and accordingly hard to sell at their real value. In the absence of important business, prices have again been reduced a little. Apples show a further decline, as there are several holdings left and a little pressure to sell has developed . Apricots are extremely firm. Figs are quoted lower, but are really nominal, as there is next to nothing of marketable quality left in the state; and the movement of odd lots of uncertain quality probably accounts for the drop, rather than any real weakness in the market. Prunes are rather quiet, and packers show no disposition to buy at present; but the situation should afford no uneasiness to growers, as stocks are light and a large part of the season's requirements still unprovided for. Peaches continue easy for spot offerings, as a good many small holders are anxious to sell, and there is not enough outside demand to absorb the stock. The New York Journal of Commerce says: "Future Coast prunes are irregular, though with a slightly firmer undertone. Buying on the part of the New York trade is confined to very small quantities, and is mostly confirmed at low prices. The irregular tendency is attributed by New York brokers to the appearance of small Coast holders in the market, who were anxious to sell their light supplies and shaded prices to attract purchasers. The larger holders maintain a very firm tendency and show no inclination to meet the quotations made by the less important operators."

Apples	6 @6½c
Apricots, per lb.	9 @12 c
Figs, white	4 @4½c
Black	2 @2½c
Calimyrna	6 @7 c
Prunes, 4-size basis	5 @5½c
Peaches	4 @4½c
Pears	4 @7 c

(Associated Raisin Co. Prices.)

Fancy Seeded, 16 oz.	7 c
Choice Seeded, 16 oz.	6¾c
London Layers, 3-crown, 20-lb. box	1.25
Imperial Clusters, 6-crown, 20-lb. box	2.50

Special Live Stock Market Report.

The cattle market shows considerable improvement from a price standpoint as there is some let-up in the hay situation and nobody is trying to force more on killers than they can handle with ease. Packers are not killing so freely as they have for the past month, and while it seems probable that there will be plenty of cattle to go round till the grass cattle begin coming in, a raise in price is looked for. Cows are getting scarce and it is almost impossible to buy them. Feeders in Nevada have had a hard winter, nobody doing better than an even break the past month. There is very little change in the eastern markets, prices not being very high.

The local mutton situation remains unchanged, so far as supply is concerned. Most of the receipts in this trade are lambs, sheep being exceptionally scarce. The shortage of wethers is attributable to the extensive lamb marketing which has been going on in the country and the trend of the times seems to continue in that direction.

Hog receipts continue light and as a result a general marking up of prices has been made on all classifications. Buyers in the country are finding it difficult to get deliveries on account of the unfavorable weather. The strengthening market seems to have restored confidence to a marked degree.

Packers still quote a half cent premium for 175 to 250 pounders, and at this price farmers can afford to cater to their requirements. Killers of block hogs are not so anxious for these heavyweights and as a result are considerably under our quotation. This disposition to pay for quality should be encouraged by the farmer, as this is a step in the right direction toward expansion of markets.

Bulk, layers, 50-lb. box 2.75

CITRUS FRUITS.

Shipments of oranges to eastern markets from southern California are going forward in large numbers, the shipments up to Feb. 7th being 4566 cars for the season, as compared with 4426 cars to same date last year. Lemon shipments to the same date were 1409 cars, as against 872 cars last season at this time.

On the eastern citrus auctions oranges are bringing good prices for this season of the year. At New York Feb. 7th, the auction averaged for navels from $2.50 to $3.70 per box, and lemons $4.15. At Chicago the same day oranges averaged from $3 to $4 per box, and lemons $3.50 to $4.25.

San Francisco markets have shown considerable life on every fair day, but with adverse weather conditions much of the time, sales on the whole have not been very heavy. Values, however, are well maintained on all lines.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50@2.75
Tangerines	1.50@2.00
Grapefruit	1.75@2.25
Lemons, box	1.75@3.00
Lemonettes, box	1.50@1.75

HONEY.

Shipments to outside markets since the first of the year have not been heavy, but the surplus is pretty well cleaned up, and the local consuming trade is beginning to come into the market more actively. Values are accordingly well maintained, and while no heavy shipments could be disposed of to advantage, a moderate amount of good honey should find a ready market.

THE H. C. SHAW CO., Distributors. Stockton, Cal.

Only $2.00 per 100 or $15.00 per 1000 for the famous Ettersburg No. 80 or 84 Strawberry plants postpaid. Would advise you to place your orders with the J. H. Keith Nursery Co., Props. of the San Joaquin Valley General Nursery and Experimental Farm, Arvin, Kern Co., Calif. Their plants are fine, well-rooted foundation stock direct from Mr. Etter. They also have fine pure Sudan grass seed grown where Johnson grass is unknown. The foundation seed supplied direct from U. S. 35 cents lb.; 3 lbs. $1.00 postpaid. Cut this ad out.

Lambs	14½c
Hogs	10½ @11 c

HORSES.

There have been no sales of horses worth mentioning in the local market this week, but a more active business is expected shortly, as there is a lot of construction work to be done at outside points as soon as the weather clears, and a number of contractors will be in the market. According to some Eastern dealers, the war buying has had comparatively little effect on the general situation, the actual number shipped being small in comparison with the number in the country; while the depression in the Southern cotton industry has thrown a lot of horses on the market.

(Approximate values at San Francisco, based on auction sales.)

Drafters, 1700 lbs. and up	$250@300
Drafters, 1550 to 1650	150@225
Chunks, 1350 to 1500 lbs.	150@175
Wagon horses, 1050 to 1350 lbs.	110@150
Green Mountain range horses, 950 to 1200 lbs.	20@ 75
Farm Workers	50@100

WOOL.

Local dealers have been operating rather actively the last couple of weeks, owing to the increasing interest Eastern markets are showing in California wools, and it is said that about half of the wool remaining in the country at the end of the year has recently been bought up, while shipments East have been heavy. Values are quite firm.

(Prices paid in the country.)

Almond Growers:

A prominent eastern dealer in the almond trade, commenting upon the offer of speculators to cut the lowest Association price, says:

"When a seller publicly acknowledges he is second fiddle, and does not even pretend to be able to get the same price, that of itself is an acknowledgment both as to the quality of Exchange almonds and their method of doing business. Of course, the bad feature and shame of it is that a comparatively SMALL lot of goods has a tendency to PULL THE PRICE DOWN on an important California product."

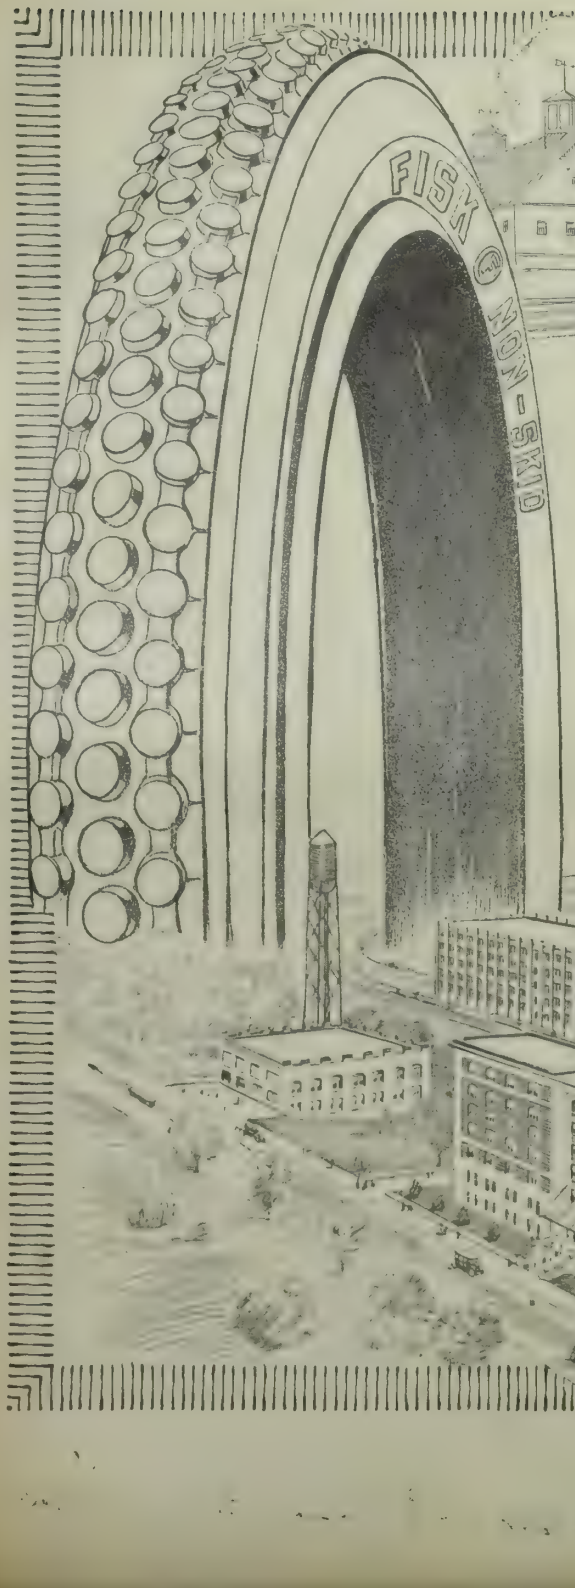
California Almond Growers' Exchange

SAN FRANCISCO, CAL.

Publisher's Department

The heavy rains of the past month have interfered with subscription work, but they have not dampened the writing ability of our staff or friends living in the country. At this time we have several fine articles in hand which will appear in an early issue of the Rural Press. One will be on the raisin situation, another covers almond growing in the Sacramento valley and a third is by Albert F. Etter telling of his great work with strawberries. This last article Prof. Wickson says will command world-wide interest. Now is the time to subscribe.

This office sent out more books during January than during any previous month. The new book "Second Thousand Answered Questions in California Agriculture" has been very well received and many orders are coming in. At this time of the year, we naturally expect to sell large quantities of California Fruits and California Flowers, nor have we been disappointed. Our other books, covering vegetable growing, swine breeding and poultry practice are all being called for in good numbers.



If a few of our subscribers who have the issue of August 14, 1915, of the Pacific Rural Press will send them to our office we will consider it a great favor. We are short this one issue to complete the several volumes that we bind.

ALMONDS

I own and operate as a going ranch 2000 acres in the centre of the Almond belt of the upper Sacramento Valley. Full equipment of buildings, heavy farm machinery, tractors, etc. Artesian water.

I desire one or more associates with sufficient capital to join me in planting several hundred acres to almonds,

Box 207 Pacific Rural Press

FISK — a Remarkable Growth

29 ACRES Devoted Solely to the Manufacture of Tires. That is the Great Story of Fisk Progress! Out of the constantly increasing demand for Fisk Tires during the past 17 years has risen the wonderfully complete and impressive organization of today, 17 years of square dealing and honest values.

The Fisk Plant is one of the most up-to-date tire factories in the world. Progress and Permanency are written there on every hand. The very latest improvements and inventions are found in buildings and equipment.

Fisk Tires are distributed through more than 100 Direct Fisk Branches located in the important business centers of the country. These Branches are in immediate touch with Dealers and Users, providing an instant supply close at hand.

Each Branch renders Free Fisk Service to all motorists regardless of the make of tire used. This Service includes changing tubes and casings, inflation, inspection, advice, instruction — *all absolutely free.* Charges are made for actual repairs *only* and we do these in the most economical manner.

There is probably a Fisk Branch within easy motoring distance of you. You are cordially invited to call and become acquainted.

SAN FRANCISCO FEBRUARY 19, 1916. LOS ANGELES

Why Raisin Men Must Keep the Faith.

Fifth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

IT WAS the fortune of this writer to attend, on January 7, 1892, a farmers' institute at Fowler, Fresno county, at which transpired an event of much interest in the history of co-operative organization in California, because at that meeting the first step toward a general association of raisin producers was taken. There were previously a few local co-operative packing-houses in successful operation. There had been some talk of affiliated action among them and the ingathering of producers generally, but the transaction at Fowler on that day was the actual initiative in such direction, and was at the time understood to be of that nature. The transaction was this, after a discussion filling most of the day: Capt. C. H. Norris, J. S. Dore, J. H. Larue, Alexander Gordon, N. W. Motheral, F. M. Morton and D. M. Pyle were appointed a committee with these instructions: "To prepare and issue a call to the raisin producers of California to assemble in Fresno soon to consider and take action upon the proposition of general co-operation of all raisin producers in the preparation, packing and marketing of their products."

The committee discharged his duties commendably. It called the contemplated convention, which assembled in Fresno on Feb. 18, 1892, passed the matter of general organization on to a larger committee, and thus set to rolling the ball which has been cushioning and caroming to the present day, and has not yet fully reached its destination. It has never yet completely known where it was going, but has always been on the way—as may be briefly outlined presently.

An Expedited Prophecy.—The raisin industry was in a bad fix in 1892; somewhat prematurely so. In 1889 the late George West, State Commissioner of Viticulture from the San Joaquin district, began to have a conviction that there might be trouble in disposing of the increasing crops of raisins, and in 1890 he published a report with statistics of acreage and product in the Fresno district and of the raisin consumption of the United States and prophesied that in 1895 the product could be twice the American consumption of raisins, and significantly added: "It is necessary to the future of the industry that these facts become generally known, and, being known, it is for each individual to decide whether or not he will engage in the industry." The condemnation of this prophecy by those who were subdividing land for sale to intending raisin-growers need not be revealed. The language they used about Mr. West would serve well as a mildew-preventive. As we now look back upon the incident, it appears that the chief mistakes he made were in estimating the speed with which his facts would work and in discerning the reason

(Continued on page 222.)

TYPICAL VIEW OF RAISIN VINEYARD IN SAN JOAQUIN VALLEY WITH FRUIT CURING IN THE USUAL WAY.

This is the great industry which has carpeted thousands of acres of California's arid plains with verdure following introduction of irrigation water, and in the service of this industry producers have developed a system of co-operative packing and marketing which must be maintained.
